Engineering-Contracting

The Only Weekly Civil Engineering Paper Published
West of New York City

VOLUME XXXIII

January-June, 1910

THE MYRON C. CLARK PUBLISHING CO.
355 Dearborn St., Chicago, Ill.

106373
21/11/10

INDEX

VOL. XXXIII, JANUARY-JUNE, 1910

GENERAL INDEX

A

Abutments Concrete, Cost 114, 354
Adverse Possession, Doctrine, Definition. 115
Aggregates (See Concretes) .....
Air Valves, Pipe Line, Water Works.... 203
Alkali, Active on Concrete 6, 539
Alvord, John W..... 51
American Society for Testing Materials.. 567
American Society of Civil Engineers.... 521
American Society of Engineering Contractors 208
American Society of Mechanical Engineers 486
American Water-Works Association..... 176
Aqueducts, Catskill, Pressure Tunnels... 122
Lining, Concrete 98
Los Angeles, Day Labor Work....443, 459
Structural Features 407
Arch Centers, Steel, Design for 150 ft. Span 120
Arches, Concrete .....
..72, 120, 234, 279, 332, 541, 476, 586
Crown Thickness, Formula 124
Groined Design in Concrete Reservoir Construction 311
Tests, New York Barge Canal..... 234
Asphalt Pavements (See Pavements)....
Asphalt Plants, Municipal.....80,157, 241
Auger, Hand for Test Borings..... 58
Automatic Regulating Dams.....278, 350
Automobiles, Roads, Effect on....17,289, 432

B

Barge Canal New York (See Canals)..
Barges, Concrete, Panama Canal..... 192
Base Plates, Formulas..... 254
Beams, Concrete, Continuity, Importance 173
Separately Molded, Various Spstems.. 304
Bearing Plates, Formulas..... 234
Bidding, Percentage .....
.....25, 119, 138, 139, 208, 281
Bids, Cost, Reimbursing Contractors.... 117
Bits, Drill, Shapes, Various in Use..... 266
Blanks, Bituminous Materials Test Record 385
Bridges, Concrete Cost Keeping..... 195
Concrete Tunnel Lining Report..... 358
Pavement Construction Record..... 79
Road Oiling Record..... 269
Strict Maintenance Record..... 17
Test Boring Record..... 9
Tunnel Cost Record..... 519
Tunnel Excavation Record.....219, 358
Wash Boring Record..... 277
Blasting, Cost.....60, 199, 307
Blasting Machines, Construction and Operation 13
Blasting Methods, Charging Drill Holes. 12
Detonators, Grades and Weights..... 11
Explosives (See Explosives).....
Firing by Electricity..... 12
Missfires, Handling 12
Moreno Dam, California..... 59
Pecos & Northern Texas Ry..... 307
Quarry, St. Helena, Ore..... 199
Shooting off the Solid..... 11
Tunneling and Loading, Large.60, 199, 307
Blasts, Large, Moreno Dam, California.. 59
Pecos & Northern Texas Ry..... 307
Quarry, St. Helena, Ore..... 199
Blow-Offs, Pine Line Water-Works.... 203
Bond, Concrete to Wood..... 163
Bonds, Pavement Work.....270, 351, 373
Borings, Diamond Drill, Cost Data, References to 23
Diamond Drill, Precautions in Making 585
Hand Auger Outfit and Operations... 58
Wash Recording Methods..... 277
Well Drill, Cost of..... 9
Boston Finance Commission, Permanent, Report 141
Boundary Monuments, Concrete..... 6
Breakwater, Colon, Rock Fill.....294, 432
Oneida Lake, Concrete..... 296
Brick Pavements (See Pavements).....
Bridge Design, Concrete Girder..... 97
Bridges, Abutments, Concrete.....314, 354
Concrete Arch, Bexar County, Texas.. 72
Centers for, Steel..... 190
Cost 98, 541
Lake Champlain & Moriah R. R..... 541
Medina New York Barge Canal.... 234
Cost Keeping System..... 194
Concrete Design, Present Methods Wasteful 279
Failures, Analysis of Causes..... 332
Girder, Advantages for Track Elevation 145, 166; 168
Cost 98
Florence, Ariz. 68, 117
Standard of Illinois Highway Commission 97, 121
Tests 121
Track Elevation Chicago, Burlington & Quincy R. R..... 168
Track Elevation Chicago, Milwaukee & St. Paul Ry..... 144
Track Elevation, Illinois Central R. R. 166
Floors, Concrete 335, 607
Foundations, McKinley, St. Louis..... 77
Maintenance by Day Labor, Chicago.. 600
Steel, Base Plate Formulas..... 254
Erection Methods 530
Erection Specifications 299
Track Elevation, Types, Cost Comparison 145, 168
Wooden Construction, New Brunswick 92
Buckets, Concrete Controllable Center Discharge 234
Track Elevation Work, Evanston, Ill. 150
Buildings, Concrete Cost.....55, 190, 304
Concrete Cost, Reduction by Working Rival Gangs 73
Separately Molded, Cost.....55, 304
Concrete Block, Cost..... 190
Cost, Diagrams for Estimating..... 184
Floors, Concrete.....283, 304, 335, 469
Foundations Caisson 440, 571
Foundations, Well 35
Girders, Long Span Concrete..... 191
Underpinning 10-Story 572
Bulkheads (See Sea Walls) .....
Business Failures, Causes..... 71

C

Caissons, Concrete, Construction, McKinley Bridge 77
Foundation Sinking Methods, Chicago 440, 571
Pneumatic, Sinking, Rate at McKinley Bridge 78
Camps, Contractors, Sanitation.....141, 153
Canal Lining, Concrete, Cost..... 398
Canals, Barge, New York, Arch Bridge, Concrete 234
Barge, New York, Cement Testing Methods 296
Dams, Concrete 295
Drag Line Excavator Work..... 383
Progress, 1909 109
Structures on 295
Calumet-Sag, Chicago Sanitary District 597
Georgian Bay Ship..... 393
Ill. & Miss. Aqueduct Construction.... 98
Lock Construction 380
Irrigation, Lining, Oil, Experience with Lining Plaster Methods..... 460
Lachine, Slope Paving Under Water.. 446
Locks, Concrete 89, 181, 204, 382, 516
North Shore Chicago Sanitary District 383, 449
Panama, Barges, Concrete..... 192
Contracts for Excavation.....111, 307
Excavation 111, 137, 213, 307
Lock Construction 181, 204, 516
Observations on 92, 163
Structural Features 462
Car, Power Required to Hoist Up Incline 279
Quarry, Electric 496
Cart, Concrete, Self Supporting..... 238
Transporting Forms 398
Cast Iron Pipe, Breakage..... 347
Catch Basins, Cleaning, Cost, Brooklyn, N. Y. 278
Cleaning, Cost, Cambridge, Mass..... 287
Cost, Day Labor *vs.* Contract..... 84
Objectionable Features of..... 17
Cement, Aerating, Compressed Air for.. 74
Bag, Volume of...1, 23, 47, 69, 91, 421, 584
Show, Chicago 29
Testing Methods, Barge Canal, New York 296
Louisville Sewer Work..... 543
Centers (See Arch Centers).....
Chicago Cement Show..... 29
Chimneys, Concrete, Construction Methods 352
Jacket, Reinforced Concrete..... 143
Chutes, Depositing Concrete by..... 286
Cisterns, Concrete, Cost..... 292
City Government, Commission Form..49, 421
Cost, Per Capita, Des Moines..... 187
Civil Service, Efficiency, How to Increase 95, 163, 257, 278
Cleaning Reservoir, Cost..... 307
Cleaning Sewers, Cost..... 106
Clearing Land, Bidding Prices..... 206
Cost 540
Cofferdam, Crib, Cost..... 88
Coloring Concrete, Directions..... 47
Columns, Concrete, Costs..... 213
Concrete, Economics 209, 210
Tests 210
Compressed Air, Consumption, Tunnel Work 219
Excavation, Wages and Working Hours 78
Concrete, Absorption, Reduction by Mixing with Mineral Oil..... 26
Abutments, Cost 114, 354
Aggregates, Grading, Value of.....50, 52
Selection and Proportion..... 52
Voids, Table of..... 53
Alkali, Effect on.....6, 539
Application in Electric Power Work... 587
Aqueduct Lining 98
Arches, Model for Testing..... 234
Barges, Panama Canal..... 192
Beams, Continuity 173
Separately Molded 304
Bituminous, Mixing 341
Bonding to Wood..... 163
Boundary Monuments 6
Breakwater 296
Bridges, Arch .....
.....72, 98, 120, 234, 279, 332, 541
Cost (See Costs).....
Girder.....68, 97, 117, 121, 144, 166
Buckets for Handling.....150, 234
Buildings 55, 73, 191, 304
Caissons 77
Canal Lining 78
Cart for Hauling..... 238
Chimneys 143, 352
Cisterns 292
Coloring, Directions for..... 47
Columns 209, 210
Contraction, Reduction by Mixing with Mineral Oil 26
Cooling, Rate Tests..... 426
Culverts 586
Curb 61, 177
Dams 110, 295
Density, Effect of Proportions of Aggregates 50, 52
Depositing by Chutes..... 286
With Tremie 196
Disintegration of by Alkali.....6, 539
Sewage and Sewage Gases.....470, 539
Drain Tile 167, 330
Drilling Outfit 434
Fence 282
Fence Posts 565
Finish, Sand Blast 421
Fireproofing Value 517
Flat Plates..... 258
Floors, Bridge 335, 607
Building 283, 304, 335, 469
Freezing Grout Wash Protection..443, 461
Girders, Long Span..... 191
Gutter 61, 177
Jacket for Chimney..... 143
Locks, Canal.....89, 181, 204, 382, 516
Mixing, Hand, Costs..... 571
Mixing, Water, Salts in, Effect..... 137
Pavement Foundations 244
Pavements 61, 201, 244, 551
Permeability, Tests of.....3, 516
Pile Protection, Efficiency..... 238
Piles 144, 355
Pipe 377
Preservation of Steel by..... 23
Proportions, Girder Bridges, Standard Highway, Illinois 97
Proportions, Sidewalks, Chicago..... 109
Reinforcing Bars, Specifications..... 493
Repairs to Wood Poles..... 588

Retaining Walls 149, 173, 328
Road Construction 16, 81, 457
Road Surfacing Blocks..... 201
Sea Walls 263
Sewers 121, 405, 553, 569, 595, 596
Shaft Lining 69, 193, 444
Slabs.....144, 148, 166, 171, 283, 304
Slide Rule for Computing..... 139
Slope Paving 446
Strength, Compressive, Washed and Unwashed Gravel 74
Compressive Waterproofing Compounds, Effect 6
Subaqueous, Depositing Methods..... 196
Testing, Compression Superior to Tensile 26
Trestles 377
Tunnel Lining..123, 245, 356, 398, 422, 505
Waterproofing Paint 584
Water Tower 224
Blocks, Buildings, Cost 190
Engine Foundations 387
Steam Curing Oven..... 284
Tests 458
Forms (See Forms).....
Models (See Forms).....
Conduits, Electrical, Construction Methods 19, 248, 400
Electrical, Costs.....19, 163, 401
Fiber with Bell Joints..... 482
Manholes 587
Connecticut Society of Civil Engineers.. 187
Construction Work, Costs, Day Labor and Contract Compared.....
.....83, 142, 443, 459, 600
Day Labor vs. Contract, Discussion of 397, 491
Outlook for, in 1910.....
Contract, Building Form for, Proposed Improved 37, 138
Contractors' Camps, Sanitation of..141, 153
Contractors' Plants (See Plants).....
Contracts, Cost, Plus a Fixed Sum..... 584
Contract vs. Day Labor Work.....
.....83, 142, 397, 443, 459, 491, 600
Convention for Standardizing Paving Specifications 200
Cost Analysis, Methods, Discussion..... 181
Cost Keeping, Blanks (See Blanks).....
Cost Keeping, Bridge Work, Concrete.. 194
Railroad Construction, Methods..... 176
Systems 184, 194, 278
Costs, Abutments, Concrete.....114, 354
Aqueduct, Los Angeles.....407, 459
Concrete Lined 100
Bituminous Concrete Mixing..... 341
Blasting 60, 199, 307
Borings, Well Drill..... 9
Boundary Monuments, Concrete..... 6
Brick Lining Concrete Sewer..... 571
Bridges, Concrete 98, 540
Track Elevation 145, 168
Buildings, Concrete 56, 190, 304
Concrete Block 190
Diagrams for Estimating..... 184
Canal Lining, Concrete..... 398
Catch Basins, Cleaning.....84, 278, 287
Cisterns, Concrete 292
City Government, Des Moines..... 187
Clearing Land 540
Cofferdam, Crib 88
Columns, Concrete 213
Concrete Blocks 190
Steam Curing 284
Concrete, Depositing by Chutes..... 286
Hand Mixing 571
Shaft Lining 194
Conduits, Electrical 19, 163, 401
Contract Sewers, Concrete..... 121
Contract *vs.* Day Labor.....
.....83, 95, 142, 443, 459, 600
Crib Timber 91, 113
Culverts, Cast Iron Pipe..... 586
Concrete 476, 586
Curb 61
Dams, Concrete 110
Crib 113
Ditch Maintenance 100
Drain Tile, Concrete 330
Drilling 215, 429
Drilling, Well 9, 402
Electricity for Lighting.....303, 319, 437
Excavation, Earth.....58, 80, 88, 113, 384
Excavation, Rock.....194, 360, 361, 544
Fence, Concrete 282
Fence Posts, Concrete..... 567
Filtering Materials, Washing..... 388
Filtering Water 163, 303
Filters, Sewage 134
Filters, Water 128, 306, 294
Floors, Concrete Arch and I-Beam.... 469
Forms 88
Knocking Down, Blaw..... 571
Foundations, Pavement 79
Timber Pile 113
Girders, Concrete, Long Span..... 191
Gutters, Concrete 61
Hauling and Loading Crushed Stone.. 80
Horses, Maintenance of..... 188
Hydraulic Filling 153
Installation, Water Meter..... 82
Lock, Concrete 88, 382
Lock Gates and Sills..... 90
Mechanical Haulage on Roads..... 594
Pavements in 1909 in American Cities 308
Pavements, Annual 31
Asphalt 31, 157
Asphalt Repair 80, 157, 242, 301
Bitulithic 61
Brick 106
Cobble Stone 61
Granite Block 61, 500, 563
Maintenance 30, 242
Wood Block Maintenance..... 592
Pipelaying 348
Pipe Lines 348
Submerged 525
Pipe, Water Intake 478
Plant, Machine Mixed Concrete..... 472
Power, Electric 303,
349, 391, 413, 414, 437, 534, 582, 583
Power for Various Industries..... 416
Power Plant Operation..... 487
Public Comfort Stations..... 537
Pumping 337
Railways, Electric 349
Electric Operating .....
349, 390, 391, 413, 414, 534, 582, 583
Elevated, Operation 369
Northern Pacific in Washington.... 44
Texas 370
Rations for Survey Parties..... 394
Reduction by Working Rival Gangs.. 73
Reforesting Reservoir Margin..... 277
Refuse Disposal 31, 326
Reservoir Cleaning 307
Reservoirs, Water-Works 110
Retaining Walls, Masonry..... 393
Revetment, Neat and Rip Rap..... 114
Road Maintenance 158, 442
Road Materials, Tests 80
Road Rollers 221
Road Rolling 221, 522
Roads, Bituminous Macadam..... 503
Concrete 81
Concrete Block 202
Grouted Macadam 376
Macadam 61, 79, 107
178, 241, 290, 338, 376, 500, 550, 563
Oiling 87
Rolling 221, 522, 563
Sand Clay 365, 457
Shell Macadam 241
Sea Walls 161
Sewage Disinfection 437
Sewage Purification 581
Sewage Purification Plants..... 136
Sewer Cleaning 106
Sewer Connections 401
Sewers 571
Shaft Excavation by Raising..... 544
Shut Piling 114
Sidewalks, Cement 109
Cinder 108
Slope Paving 354
Steam Curing Oven for Concrete Blocks 284
Stone Crushing 464
Street Cleaning, Hand Sweeping.23, 69, 221
Street Sprinkling 301
Stripping Earth 58
Subways, New York..... 348
Surveys, English Ordnance..... 394
Studia 419
Tank, Steel 226
Telephone Lines 111
Tie Preservation 253
Tie Protection 297
Timber Preservation 67
Tracklaying by Machine..... 559
Track, Street Railway.....370, 590
Transmission Line 473
Trenching, Potter Trench Machine.... 571
Trenching, Sewer 597
Trestles, Concrete 379
Tunnel Lining, Cast Iron, Calking.... 540
Tunnel Lining, Concrete.....400, 422
Tunnels, Rock.....215, 427, 475, 518
Tunnels, Los Angeles Aqueduct..... 504
Water Filtration 163, 203
Water Mains.....87, 337, 461
Water Meters, Removing and Testing 341
Water Pipes, Service..... 136
Water Purification Plants.....128, 306
Water Softening 435
Water Supply, Fire Service..... 481
Water Tower, Concrete..... 226
Crib, Timber Cost.....91, 113
Cross-Section Areas Computation, Criss-Cross Method Simplified..... 583
Cross-Ties (See Ties).....
Crown Thickness of Arches..... 124
Crushed Stone, Amount Required for Macadam 126
Cost, Day Labor *vs.* Contract 87
Cost, Hauling and Loading..... 80
Cost Hudson River Tunnels..... 464
Heating in Wagons..... 192
Plant, Dolere & Shepard..... 495
Testing Methods for Road Work..... 403
Washing, Plant 497
Crushers (See Stone Crushers).....
Culverts, Cast Iron Pipe..... 586
Concrete Arch 586
Concrete, Cost 476, 586
Corrugated Iron 576
Curb, Concrete, Cost..... 61
Specifications 177

D

Dams, Automatic Regulating.....278, 350
Concrete, Barge Canal, New York.... 295
Cost 110
Construction, Early, in Connecticut... 227
Crib, Construction Methods 113
Cost 113
Earth, Irrigation, Porto Rico.....57, 568
Failures, Dansville, Cause....117, 207, 256
Scioto River, Columbus Water-Works 110
Dansville Dam Failure.....117, 207, 256
Day Labor *vs.* Contract Work.....
.....83, 142, 397, 443, 459, 491, 256
Depreciation, Contractor's Plant..... 163
Crushed Stone Plant..... 497
Electrical Properties 487
Street Railway Properties..... 560
Water-Works 598
Derrick Boom, Attaching to Tower Leg. 471
Trench Excavation 606
Detonators, Electric, Grades and Weights of 11
Diamond Drill Borings (See Borings)..
Dikes, Construction for Tide Lands.... 181
Ditches, Design, Effect on Maintenance. 100
Maintenance Cost 100
Maintenance Methods 100
Drain Tile, Concrete, Cost..... 330
Concrete, Dissolution in Water, Tests 330
Specifications 167
Drawings, Filing Methods..... 205
Dredging Plants, Hydraulic Filling, Cairo, Ill. 151
Drill Bits, Shapes, Various in Use..... 266
Drill Holes, Charging, Directions..... 12
Drilling, Concrete, Outfit for..... 434
Cost 215, 429
Diamond, Cost Data, References to.... 23
Precautions in 585
Hand Auger Outfit and Operation ... 58
Methods, Concrete 434
Land Sections, Hudson River Tunnels 427

The Outlook for 1910.

Cause exists for hearty exchange of congratulations among engineers, contractors and manufacturers over the outlook for 1910. Never in the commercial history of America have there been so many evidences upon which to base predictions for "a banner year." Those who had shipments to make or to receive by rail in 1906 and 1907 will remember that freight congestions and lack of cars were a serious handicap to the progress of all construction. Such railway authorities as James J. Hill were then saying that the railways had fallen far behind the times in their building of additional facilities for handling traffic. Certain it was that the construction of new lines and the double tracking of old lines had not kept pace with the general growth of industry.

The panic that came in October, 1907, stopped much industrial growth, but it did not stop the growth of population, nor did it put a quietus on the efforts of the American farmer. Hence we find ourselves now facing even greater traffic congestions in 1910 than existed two or three years ago. Railway managers are preparing as fast as possible by orders for equipment, and the great steel mills have been unable to close down for the usual Christmas holiday season.

The construction of electric railways will proceed at a more rapid pace than ever, judging from applications for franchises and from the organization of new companies that have been reported in our news columns.

Road building has been given the greatest impetus in the world's history, first by the development of the automobile, second by the gradual abandonment of the old day labor system of road building in towns and counties and the adoption of the contract system under laws wherein "state aid" is given in financing road work. State after state has followed the original lead of New Jersey, until now there are few states without highway commissions in charge of the building of improved highways. The great prosperity of the farming classes has enabled them to buy auto cars and to join the general cry for more good roads. Even the railways themselves are awakening to a realization of the fact that good roads will solve many of their own problems by enabling farmers to get to the railway stations at all times of the year with produce, thus doing away with the present dearth of shipments during rainy weather and the consequent deluge of produce when the mud dries up. The Pennsylvania Railway is about to send a special car out along its lines carrying a road expert to lecture to farmers on the economic merits of good roads. This is sound business policy on the part of the Pennsylvania Railway, for everything that increases the prosperity of the farmers in the territory tributary to that railway also increases the prosperity of the railway.

The same force—the automobile—that has done so much to stimulate road improvement is also destined to work a great awakening in cities where the "dust nuisance" is becoming intolerable. New pavements will be built in the next few years at a rate hitherto undreamed of.

The knowledge that typhoid and other diseases are conveyed by water has already had its effect in leading large cities to build filtration plants and to go great distances to get pure water supplies. The smaller cities and towns are now awakened by the sight of these examples of activity in the great cities and will unquestionably expend sums very large in the aggregate to improve their water works.

The same considerations as to sanitary measures of precaution will stimulate the building of sewers.

The amazing development of the cement industry will continue to have its effect upon the reconstruction of bridges, buildings, etc.

Look where we may, there is work and lots of it in sight for manufacturers, contractors and engineers during this good year of 1910 and its immediate successors. We therefore extend hearty congratulations to all and wishes for the best of prosperity.

Further Light on the Size of One Cubic Foot of Cement.

The size of a barrel of cement has been for years a splendid subject on which to base a discussion, notwithstanding the fact that it is today almost an impossibility to purchase a barrel of cement, the bag now being the unit. It is one of the strange examples of how habits cling, to read specifications calling for the proportioning of concrete mixtures with the barrel as a unit, when only bags, four of which make one barrel, are used by the contractor. In 1896 the Boston Transit Commission had a number of measurements made of the capacity of Portland cement barrels and it was found that the capacities varied from 3.12 to 3.5 cu. ft., the mean volume being 3.29 cu. ft. These experiments are classic and no writer on concrete would have the courage to omit mention of them.

In the famous "Report on the Testing of Hydraulic Cements," made by a board of officers of the Corps of Engineers, United States Army, published June 6, 1901, a step was taken that effectually fixed the size of the unit of measurement of Portland cement. Section 5 of the Specifications for American Portland Cement reads as follows:

> Sec. 5. The average weight per barrel shall not be less than 375 lbs. net. Four sacks shall contain one barrel of cement. If the weight, as determined by test weighings, is found to be below 375 lbs. per barrel, the cement may be rejected, or, at the option of the engineer officer in charge, the contractor may be required to supply, free of cost, to the United States, an additional amount of cement equal to the shortage.

One of the editors of this paper, then in private practice, a year or two later prepared his specifications, omitting the barrel and using a bag as being equivalent to 1 cu. ft., which specifications were published in ENGINEERING-CONTRACTING Dec. 22, 1909. Instead, however, of using the "net weight" of the cement in a bag or sack his specifications called for a "gross weight" of not less than 95 lbs. per bag A comparison of those specifications with the Engineer Corps' specifications will show where he obtained his idea as to weights.

The idea of the bag being 1 cu. ft. was given to him by salesmen of the cement manufacturers. Shortly after the government report appeared the manufacturers got together and decided upon a bag size which would contain "94 lbs. net" of cement, and this is what every man obtains now who buys cement. The salesmen call one bag a cubic foot and it is convenient to so use it. The use is well nigh universal, except in a few isolated cases where some engineers have arbitrarily decided to use 100 lbs. as 1 cu. ft. and hold the contractors to it as well as they can. The bag being fixed in size by common agreement among manufacturers and it being unlikely that we will ever secure another agreement

Copyright 1910, by the Myron C. Clark Publishing Co. All rights of republication reserved.

making it "100 lbs. net" instead of the present size, why should engineers stick to an imaginary quantity?

How did it ever come about that 100 lbs. was selected as an ideal weight for 1 cu. ft. of cement? In "A Treatise on Concrete, Plain and Reinforced," by Messrs. Taylor and Thompson, we read that the authors corresponded with or personally interviewed some fifty prominent engineers representing all sections of the United States, and asked them their opinion as to the proper weight of a cubic foot of cement. The units suggested varied, but—

> An approximate average of all the figures suggested was 3.8 cu. ft. to the barrel, corresponding to 100 lbs. per cubic foot. * * * Accordingly in cases where it is advisable to specify the proportions by parts, the authors have adopted this unit as being a standard.

This is the only record we have and it will be noticed that the weight selected was one that was merely an approximate average of weights suggested by fifty engineers selected from 25,000 or more practicing engineers in the United States and twice as many contractors, all of whom are obliged to take the unit given them by the cement manufacturers and who are not equipped with weighing machines or other apparatus to divide the bag into different units and whose time will not permit it. The easiest and most sensible plan is to do just what these practical constructors do; that is, follow the advice of the cement salesman and make their mixtures come out even with the bag assumed as being equal to 1 cu. ft. of cement.

We are not advocating any particular weight to be taken as that of a cubic foot of cement. It makes no difference to this paper or the editors whether the weight is 100 lbs. or 94 lbs. That is not the point. We simply advocate getting some definite standard fixed and as the bag has been fixed by the coming together of the manufacturers, then let the bag be the unit and call it 1 cu. ft. and thus fall in line with the majority of users and common custom among concrete men and cement salesmen. The experiments made for the Boston Transit Commission showed the weight of a packed cubic foot of cement might be anything from 112.8 lbs. to 123.2 lbs. The average was 118.8 lbs. A shaken foot varied from 102.3 lbs. to 109.4 lbs., the average being 105.1 lbs. A loose foot varied from 88.5 lbs. to 100.5 lbs., the average being 92.6 lbs. It may be seen from the foregoing that the cubic foot of cement is a decidedly variable quantity and unless some definite weight is fixed the amount a man puts into a batch depends upon how he deposits it. If he gently pours it from the bag he may get a cubic foot which weighs on an average only 85.4 lbs. It looks like common sense therefore to take a unit already provided by the cement mills and furnished with variations not exceeding one pound plus or minus, and call it 1 cu. ft.; *especially as it is now done by practically all the concrete workers in the country.* The only reason that weight is mentioned is to determine the size of the bag and it is most readily done by taking the accepted weight. It is a far more simple matter for a contractor to take one bag in forty or one bag in fifty and weigh them, than to weigh each lot of cement going into each batch of concrete. The reason for specifying a "gross weight" has been already stated.

Take for example batches wherein four bags will be the amount of cement used, and the mixture is 1:3:6. The contractor makes a box holding 12 cu. ft. and filling it once gets his sand; filling it twice gives him his stone. If he goes upon the theory that the cubic foot should weigh 100 lbs. and he is compelled to use the bag as a unit, something he cannot escape, he must make his measuring box 11.4 cu. ft. capacity and one who has seen the average man wrestle with fractions knows that the box is much more likely to be made actually 12 ft. to make it come out even and avoid "figgerin'." The cement barrel as a package was something that once existed. The cement barrel as a fixed quantity never existed until after the cement barrel as a package had disappeared. In spite of this it persists as a standard of measure and in the last proceedings of the National Association of Cement Users a committee solemnly proposed the following:

> Proportions of 1:1½:3, that is, one barrel (4 bags) packed Portland cement to 1½ barrels (5.7 cu. ft.) loose sand to 3 barrels (11.4 cu. ft.) loose gravel or broken stone. Proportions 1:2:4, that is, one barrel (4 bags) packed Portland cement to 2 barrels (7.6 cu. ft.) loose sand to 4 barrels (15.2 cu. ft.) loose gravel or broken stone. Proportions 1:2½:5, that is, one barrel (4 bags) packed Portland cement, to 2½ barrels (9.5 cu. ft.) loose sand to 5 barrels (19 cu. ft.) loose gravel or broken stone. Proportions 1:3:6, that is, one barrel (4 bags) packed Portland cement to 3 barrels (11.4 cu. ft.) loose sand to 6 barrels (22.8 cu. ft.) loose gravel or broken stone.

Here we find a committee recommending the barrel as the unit of measure and then defining the barrel in cubic feet and giving the contractor fractional parts of a foot for his measures. Since the size of the barrel has to be defined in cubic feet why mention the barrel? It should be enough to give the recommended proportions and then state that these proportions are by measure, the bag "having a gross weight of not less than 95 lbs. being considered as equivalent to 1 cu. ft. of cement."

The bag is now a fixed quantity according to an agreement between American Portland cement manufacturers. The 100-lb. cubic foot of cement is an ideal fixed "as an approximate average of all figures suggested by about fifty engineers," this average being settled upon after the cement manufacturers had fixed the size of the bag and their salesmen had commenced educating the ordinary user of cement in the use of a bag as a cubic foot. Until the size of the bag is changed by the manufacturers let us say a cubic foot weighs just what a bag now weighs. When the weight of the bag is changed, if it is ever changed, we can change our weight of a cubic foot of cement. It is after all only falling into line and following the procession. This is better than drawing specifications that involve trouble in enforcing and are generally unsatisfactory. The difference is about 6 per cent and cannot, we imagine, make very much difference in the strength of the concrete. We do not, however, want our readers to misunderstand us and think we are making suggestions that the cubic foot of cement be fixed at any definite weight. The weight is a minor consideration. A uniform standard is important.

Charles B. Dudley.

The death of Dr. Charles B. Dudley, chief chemist of the Pennsylvania R. R., on Dec. 21, 1909, deserves more than the passing notice given it in our last issue. This is true not merely because Dr. Dudley was a testing engineer of international fame or because he was a man of most lovable character but because of the work he did for the advancement of good construction. In his 34 years of professional labors, Charles B. Dudley did a paladan's service in advancing the character and quality of the structural materials used by railways. His belief was that no specification should be made for any material without exhaustive study and as full knowledge as possible of the conditions under which that material did its work. This belief he put into practice to the utmost of his powers. Every specification drawn by him for the great railway which he served was based on investigation and study of the most painstaking character. It was not unusual for him to devote two or three years of special investigation to his subject before the written specification appeared. The results of these labors were not of the kind that gets into the talk of the man on the street but they were of the kind that makes a man noted among his professional co-workers. Dr. Dudley's specifications for the Pennsylvania R. R. are to-day largely the standards for the railways of America.

To catalog Dr. Dudley's work is not our purpose. He was called upon to test and pass judgment upon the quality of nearly all the materials employed by a railway in its construction and maintenance work. His studies covered such various subjects as steel for rails; car lighting, heating and ventilating; cast iron car wheels; coal analyses; water purification; paints; bearing metals, and transportation of explosives. His work was not confined, however, to the services rendered to his employers. As president of the American Society of Testing Materials and as a member of a dozen American and foreign technical and scientific bodies he furnished papers and discussions that are reputed among chemists and engineers.

Dr. Dudley was what we like to think of as the typical American in his parentage, education and development to prominence. He was born at Oxford, Chenango county, New York, on July 14, 1842. His parents were New Englanders. As a lad he went to the village school and later to the local academy in winter, working on the farm in summer. In 1862 he enlisted as a private in the war of the Rebellion and served until the end of the war in 1865. Resuming his studies he entered Yale college in 1867, graduating in 1871. A year was then spent in newspaper work to earn money to pay off obligations incurred in his college course and to give him a start in the Sheffield Scientific School which he entered in 1872, graduating two years later. For a year after graduation he worked as assistant professor of physics at the University of Pennsylvania. On Nov. 10, 1875, he was made chemist of the Pennsylvania R. R. At that time there were few if any specifications; the study of the properties of materials was young; the study of materials from the standpoint of service had barely been born.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Tests to Determine the Efficency of Various Commercial Waterproofing Compounds for Concrete.*

Introduction.—The object of these tests was to determine the efficiency of some of the commercial compounds used for the water proofing of concrete.

Tests were made on 14 compounds, each compound being subjected ordinarily to pressures of approximately 20 lbs. per sq. in. and 40 lbs. per sq. in. The duration of the test was usually three days, and a record was kept of the amount of water entering the concrete. In order to ascertain the effect on the strength of concrete of the compounds which are added to the body of the concrete, compression specimens were made. Three of the compounds were tested in this manner, the specimens being broken at the ages of approximately 1, 2 and 10 months. This work is a partial repetition and a continuation of a thesis completed by S. R. Hatch and H. E. Ketchum of the class of 1907.

Description of Apparatus and Material.—The apparatus which was designed for these tests consists essentially of 8 6-in. pipes filled with concrete and a pipe system connected with air and water reservoirs. Figure 1 is a general drawing of the pipe system for four specimens, the apparatus for the remaining four specimens being the same as shown.

The molds shown in Fig. 1 were 6-in. wrought iron pipe, 12½ in. long, with a cast iron flange screwed to the upper end. In order to prevent the passage of water between the pipe and the cement lining ten or twelve V-shaped grooves were cut in each pipe, each groove extending around the inner surface of the pipe.

This flanged pipe was attached to the casting by means of 6 eye-bolts. A ¾-in. pipe, 4 ft. 6 ins. long, was screwed into this casting. Each of these ¾-in. pipes was joined to the main pipe, which in turn connected with the water main and with the air reservoirs. The shut-off globe valves for water and air are shown on the pipes connecting the main pipe with the water main and with the air reservoirs. Two cast-iron cylinders, 6½ ins. in diameter and 4 ft. 8 ins. long, formed the air reservoirs. They were connected with a large air-tank, not shown, by means of the pipe shown in Fig. 1, a shut-off globe valve being placed between the air-tank and air-reservoirs.

A glass tube and attached scale graduated to hundredths of feet, were fastened to each ¾-in. pipe in order to obtain the water level in the pipe. The globe valve "V" was used to disconnect any specimen proving defective. The ¾-in. pipe and glass tube were drained by means of the needle valve. A gage registered the air pressure.

The proportions by volume of the concrete were 1:3:5, the required amount of the materials being weighed on a scale. No attempt was made to secure a waterproof concrete by proper proportioning. On the contrary, a lean mixture was desirable in order to bring out the waterproofing qualities of the compounds.

Local stone and sand and Atlas cement were used. The stone was a rather sandy lime-stone while the sand was of the fine bank variety.

The compounds tested, which were all secured through local dealers in order to obtain the ordinary commercial product, were Century Cement Fluid, Dehydratine No. 4, Des Moines Elaterite No. 60, Hydrex Waterproof Felt and Compound, Limate, Medusa Waterproof Compound, Siastex Waterproofing Fabric No. 2 and Pitch, Universal Damp-Proof Compound, Aquabar, Antihydro, Antihydrine, Wunner's Bitumen-Emulsion, Coatine, and Flexible Compound. In nearly all cases the manufacturers, at our request, gave special instructions in regard to methods of waterproofing against the pressures used, such instructions being usually followed in the tests. As the name indicates, Universal Damp-Proof Compound is used for damp proofing and not for waterproofing.

Method of Making the Specimens and of Performing the Tests.—Materials sufficient for two specimens were first weighed out. The sand was spread out evenly on the mixing floor and upon this was placed the cement in a thin layer. Two men with shovels mixed the sand and cement thoroughly to an even color when a crater was made in the center which was filled with water. After the water was absorbed the mass was turned several times until the mortar was in the form of a thick paste. The stone which had previously been dampened was now spread over the mortar and the whole turned by two men with shovels for five minutes, water being added at times with a sprinkler. The consistency of the concrete was such that it flowed readily from a pile on the floor. A quantity of neat cement was now mixed with sufficient water to form a thick paste.

The 6-in. pipe was placed on the floor with flanged-end up and a loose fitting wood disk

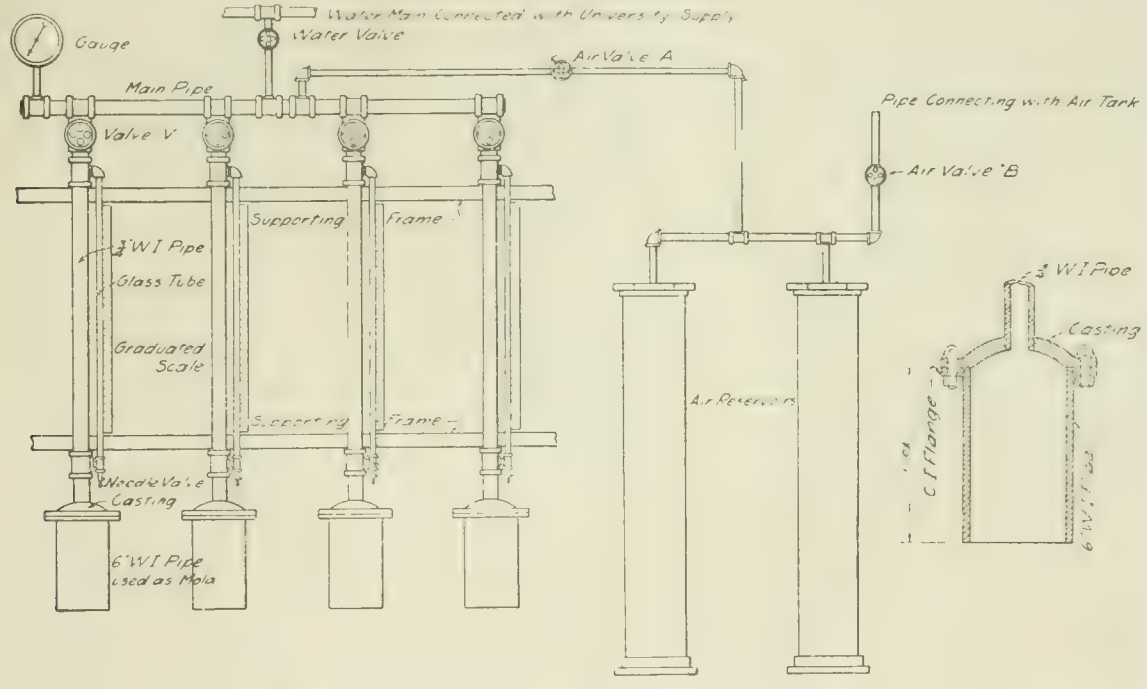

Fig. 1—Apparatus for Testing Permeability of Concrete and Details of Mold for Test Piece.

which had been turned on the outside to a taper, was centered on the wood disk. A lining of neat cement paste varying from 6/10 to 7/10 in. in thickness was now tamped into the annular space between the pipes, care being taken to fill the grooves in the outside pipe. This lining was carried up to within one inch of the top of the inner pipe, which was then filled with concrete to the level of the cement lining, the concrete being tamped well with a trowel meanwhile. The inner pipe was now carefully drawn about 3 ins., and the cement lining and concrete were deposited as before. This operation was continued until the specimen was completed, the depth of concrete being about 12 ins. The manner of finishing the upper surface varied for the different types of specimens and will be described later.

The cement lining and grooves were very effective in preventing water from seeping along the surface of the pipe. This was shown by chipping out the concrete and the lining of several specimens that had been subjected to pressure. While damp spots were found here and there in the pipe, in no case were

*Abstract of Bulletin No. 336, University of Wisconsin, by F. M. McCullough, Instructor in Mechanics.

they continuous. Neither was there any unusual flow between the concrete and the cement lining.

A set of 8 specimens was usually made for each kind of waterproofing, 4 of the specimens being tested at a pressure of 40 lbs. per sq. in. and 4 at a pressure of 20 lbs. per sq. in. All specimens were first tested at pressure of 40 lbs. per sq. in. and, if satisfactory, no other specimens were made. The duration of the tests was about 3 days, although the time was extended to 7 or 10 days in a few cases. In order to prevent shrinkage cracks, the specimens were covered with damp cloths for a few days after being made. The specimens were stored in air and were 35 days old when tested. The pressure was at all times applied to the upper or waterproofed surface of the concrete.

The specimens were securely bolted to the castings, an Eclipse rubber gasket being used between the finished faces of flange and casting. With the air valve *A* closed and the air valve *B* opened, air was admitted to the reservoirs until sufficient pressure was obtained. The water-valve was opened and water was allowed to fill the ¾-in. tubes. Care was taken that the pressure did not exceed that used in the test, this being regulated by opening the needle-valves. Air-valve *B* was closed and air-valve *A* connecting with the air reservoirs was opened, thus subjecting the specimens to pressure. Usually it was necessary to drain the ¾-in. pipes through the needle valves until the water level was visible in the glass tubes.

The rate of flow of the water through the concrete was obtained by noting the scale readings and the time. Pressures were also noted, but they showed very little decrease as the volume of the air-reservoirs was very large compared to the volume of the ¾-in. pipes. No readings were taken for five minutes after the pressure was on. As the rate of flow rapidly decreased readings were taken at intervals of 10 or 15 mins. for the first few hours and then at intervals gradually increasing from 2 to 8 hrs. The bottoms of the specimens were frequently examined and any dampness noted.

The threaded joint between the 6-in. pipe and the flange was the only unsatisfactory part of the apparatus. In some specimens considerable leakage was noticed at this joint, the cause no doubt being due to the springing of the joint when bolting the flange to the casting. When readings were taken these joints were always carefully examined and any leaks noted. The effect of this leakage has been eliminated as much as possible in reducing the data. Occasionally it has been necessary to throw out the entire set of readings on a specimen. This defect may doubtless be remedied by using a heavier flange.

Results of Experiments.—The compounds that were tested may be classified as follows according to the manner in which they were used:

(1) Compounds that were applied to the surface of the concrete. These may be subdivided into three classes: (a) Compounds which were applied as surface paints, as Century Cement Fluid, Des Moines Elaterite No. 60, Universal Damp-Proof Compound, Antihydrine, and Flexible Compound. (b) Compounds which were applied in layers of felt, burlap, or tarred paper with a cementing material, as Hydrex Waterproof Felt and Compound, Siastex Waterproofing Fabric No. 2 and Pitch, and Dehydratine No. 4 and common tarred roofing paper. (c) Coatine which is a surface coating used in the form of a thick layer.

(2) Foreign ingredients that were added to the body of the concrete as Limate, Medusa Water-Proof Compound, and Aquabar.

(3) Foreign ingredients that were added to a mortar coating as Medusa Water-Proof Compound, Aquabar, Antihydro and Wunner's Bitumen-Emulsion.

A set of specimens was made using for waterproofing an ordinary mortar coating and a neat cement wash, this method of waterproofing being frequently made use of in reservoirs under a low head. In order to determine the effectiveness of waterproofing materials in general, a set of specimens was made in which the concrete was not waterproofed.

Different methods, as illustrated in Fig. 2, were used in finishing the upper surface of the specimens, depending upon the kind of waterproofing compound used. As shown at *A* and *B* in Fig. 2 the concrete was finished flush with the top of the pipe, the upper surface of the concrete being well troweled. Before troweling, the specimens were allowed to stand a half hour in order that the free water on the concrete might be absorbed. The cement lining extends to the top of the concrete in *B*, while in *A* it is cut off ¼ in. below. In the specimens that were coated with mortar (see *C* and *D* of Fig. 2) the surface of the concrete was ¾ in. below the top of the pipe. After the concrete had absorbed the standing water the mortar top was added, the surface of the concrete and the mortar being thoroughly troweled.

The experiments will be discussed in the same order in which the waterproofing compounds have been considered. In applying all surface preparations care was taken to secure a dry, clean surface and to have the preparations well brushed in.

Century Cement Fluid.—This is a gray substance resembling caked putty, which was thinned with benzine to the consistency of a thick cream before being used. It is sold by the Century Cement Fluid Co., Madisonville, Ohio. The compound was applied in three coats with a brush at the ages of 14, 24 and 30 days. Only four specimens of the type shown at *B* in Fig. 2 were made because of a lack of time. These, were subjected to a pressure of approximately 20 lbs. per sq. in. for 263 hours and no appreciable flow was noted.

Des Moines Elaterite No. 60.—This is a black tar-like liquid furnished by the Elaterite Paint & Manufacturing Co., Des Moines, Ia. It is of the consistency of linseed oil and was applied cold. Eight specimens were made similar to that shown at *B* in Fig. 2. Three coats of the compound were applied at the ages of 15, 23 and 31 days for the specimens tested at 20 lbs. and at the ages of 10, 17 and 23 days for those at 40 lbs. The specimens subjected to a pressure of 201 lbs. showed no measurable flow during the 72 hrs. that they were under pressure. The flow of the specimens subjected to a pressure of 40 lbs. was quite variable. The duration of the test was 68 hrs. Specimen No. 53 was practically impermeable, the flow of No. 54 and No. 52 was moderate but No. 51 showed excessive flow. While considerable leakage was noted at flange joint of No. 51 and No. 52, this leakage would not account for the increased flow of No. 51. Furthermore, while the bottom of No. 53 and No. 54 were dry at the end of the test, the bottom of No. 51 was wet and that of No. 52 was damp.

Universal Damp-Proof Compound.—This is a heavy tar-like paint which was secured from the Universal Compound Co., No. 88 Maiden Lane, New York City. The 8 specimens were of the type sketched at *B* in Fig. 2. The compound was applied at the age of 15, 23 and 30 days for the pressure of 21 lbs. and at the age of 10, 16 and 26 days for the high pressure specimens. The results at the 20 lbs. pressure for a period of 251.5 hours were satisfactory but extremely variable. Specimens No. 127 and No. 130 were practically impermeable, while specimens No. 128 and No. 129 showed moderate flow. Three of the four specimens that were tested at a pressure varying from 35 lbs. to 37 lbs. showed excessive flow, while considerable water entered the fourth specimen. Moisture was noted on the bottom of No. 57 within 6 hrs. after the pressure was on, while No. 58 and No. 56 were wet within 16 hrs. Specimen No. 59 remained dry on the bottom during the test which continued for 69 hrs This compound was unsatisfactory at this high pressure.

Antihydrine.—This compound is manufactured by The Antihydrine Co., New Haven, Conn. It is thin tar-like liquid which is applied cold. Because of a lack of time only 4 specimens of the type shown at *B* in Fig 2 were made. Three coats of Antihydrine were applied at the age of 15, 23 and 31 days. Under a pressure of 20½ lbs. one of the specimens was impermeable, while the flow for the remaining three was moderate. All the specimens were dry on the bottom at the end of the test, which lasted about 168 hrs. These specimens were removed from the apparatus and stored for 26 days when they were tested at a pressure of 40 lbs. for 79 hrs. The flow for each of the specimens was very small.

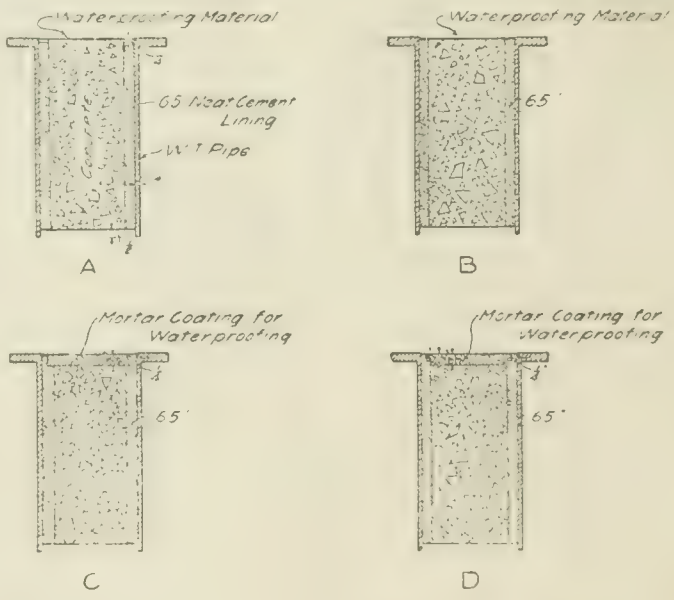

Fig. 2—Sketches Showing Method of Finishing Upper Surface of Concrete.

Flexible Compound.—This material, which resembles linseed oil in color and consistency, was secured from S. P. Holmes & Co., Chicago, Ill. Before applying the compound it was mixed with white lead, the proportions being 25 lbs. of lead to 1 gal. of the compound, the mixture being of a creamy consistency. A set of specimens was made similar to that shown in Fig. 2 at *B*. Three coats of the waterproofing were used; applied the age of 15, 23 and 30 days for the low and at 10, 16 and 26 days for the high pressure specimens. The results at each pressure were very satisfactory, the flow being small and uniform. The first set of specimens was tested at a pressure of approximately 21 lbs for 251.5 hrs., and the second set at a pressure varying from 35 lbs. to 37 lbs. for 69 hrs.

Hydrex Waterproof Felt and Compound.—These materials were purchased from the

Hydrex Felt & Engineering Co., New York City. Four specimens, similar to those shown in Fig. 2 at *A*, were treated with these compounds at the age of 19 days. The compound was heated so that it ran readily from a stick and was then quickly applied with a swab in an even layer to the upper surface of the concrete. A sheet of felt was now placed on the compound and well smoothed with a brush. Alternate layers of compound and felt were applied until the specimen was covered with three thicknesses of felt and four layers of the compound. The sheets of felt were of sufficient size to extend outside of the flange. This waterproofing gave excellent results, the specimens showing no flow whatever when subjected to a pressure of 40 lbs. for 163 hrs.

Siastex Waterproofing Fabric No. 2 and Pitch.—These materials were obtained from the Sicilian Asphalt Paving Co., New York City. The form of specimen used and the manner of applying the waterproofing were exactly the same as for Hydrex Waterproofing Felt and Compound. The specimens were treated at the age of 11 days. The test continued for 68 hrs. at a pressure of 39 lbs. and the specimens showed no permeability whatever.

Dehydratine No. 4 and Tarred Roofing Paper.—Dehydratine No. 4 is manufactured by the A. C. Horn Co., New York City. It is a black tar-like liquid of medium consistency which was applied cold. Tarred roofing paper similar to that found in ordinary building construction was used with this compound. The four specimens were of the type sketched at *A* in Fig. 2, and the materials were applied in the same manner as was the Hydrex Felt and Compound with this exception. Two coats of Dehydratine were applied to the surface of the specimens and to the upper sheet of roofing paper, the first coat being quite dry when the second coat was added. The flow at a pressure of 40 lbs. was practically zero for the 66 hrs. that the test continued.

Coatine.—This is a gray fibrous material resembling soft putty and was obtained from the H. B. Morgan Co., Grand Crossing, Chicago. It does not appear to harden and was still quite plastic 35 days after applying. Eight specimens were made of the form shown at *D* in Fig. 2 but with Coatine used in place of mortar. In order to secure adhesion between the Coatine and the concrete and cement lining, the surface of the latter was roughened with a trowel and allowed to set thoroughly before the Coatine was applied. The layer of Coatine was placed on the specimens at the age of 5 days, care being taken to secure a good joint by proper troweling. At a pressure of 20 lbs. for 74 hrs., specimen No. 193 was impermeable while No. 192 and No. 195 gave a very slight flow. At an average pressure of 38 lbs., specimen No. 200 was impermeable, No. 202 practically so, while No. 203 showed a slight flow and No. 201 a moderate flow. However, the needle valve of No. 201 leaked throughout the test, and this will account in part for the increased flow of the specimen.

Antihydro.—This is a thin liquid, greasy in consistency and containing a brown sediment. It was secured from the F. M. Hausling Co., New York City. Eight specimens were made of the type shown at *D* in Fig. 2. After the concrete had absorbed the water standing on its surface, the mortar coating was applied in three parts, the total thickness being ¾ in. The concrete was first covered with a slush coat or grout of neat cement to a thickness of ⅛ in. This was followed by a scratch coat of mortar ¼ to ⅜ in. thick, the proportions being 1 part of cement to 2 parts of sand. After the initial setting of the scratch coat, the finish coat of mortar was applied, its thickness being ¼ to ⅜ in. and the proportions 1 part of cement to 1 part of sand. Each coating was gaged with a mixture of water and Antihydro, the proportions by volume being 1 part of Antihydro to 10 parts of water. Care was taken to thoroughly trowel each coating. The results at a pressure of 40 lbs. was quite satisfactory. The flow was small and uniform for the different specimens. With the exception of specimen No. 190, which showed leakage at the flange joint, the specimens were practically impermeable for a pressure of 20 lbs. when continued for 141 hrs.

Plain Mortar.—Eight specimens were made similar to that sketched at *C* in Fig. 2. A ¾-in. mortar coat of the proportions, 1 part cement to 1½ parts sand, was applied to the concrete, the mortar being well troweled. At the age of 14 and 23 days the surface of each specimen was painted with a coating of neat cement of a creamy consistency. The cement and mixing water were not treated with any waterproofing compounds. Three of the specimens that were tested at a pressure of 39 lbs. gave satisfactory results. Specimen No. 66 showed excessive flow, dampness being noted on the bottom 24 hrs. after pressure was applied. The flow was moderate for the three specimens that were subjected to a pressure of 19½ lbs. Owing to defective apparatus it was not possible to test specimen No. 135.

Tests at pressures of 40 lbs. and 20 lbs. were also made on Medusa Water-Proof Compound, Limate, Aquabar, Wunner's Bitumen-Emulsion and plain concrete, but the results obtained were conflicting. Additional tests on these materials are desirable.

However, these two facts were brought out:

1. That when Medusa Water-Proof Compound, Limate and Aquabar were added to the body of the concrete and not in the form of a mortar coating, unsatisfactory results were obtained in 45 out of 48 specimens.

2. That all specimens of plain concrete were wet on the bottom either before or at the end of 3 days, thus showing the effectiveness of some of the waterproofings discussed in this bulletin.

Compression Tests on Concrete.—The proportions by volume of the concrete were 1:3:5. The cement, sand, and stone used were the same that were described under the permeability tests. The concrete was machine-mixed, the following method being used except in the case of Medusa Water-Proof Compound. Sufficient sand, cement, and stone were weighed on a scale to make 2½ cu. ft. of concrete. The sand and cement were thrown into the mixer in the order named. The mixer was run about one minute, sufficient water being slowly added to form a stiff mortar. The stone was now dumped into the mixer and the whole mass turned for 1½ minutes, the water being again gradually added until the concrete was of a wet consistency. The compounds tested were Limate, Medusa Water-Proof Compound, and Aquabar.

The compression specimens were of a cylindrical form, 6 ins. in diameter and 18 ins. high, cast iron molds being used. After the molds were set up on a horizontal plate, the concrete was deposited in them in layers, it being well stirred with a steel rod. Sufficient concrete was used so that after settling, its surface was slightly below the top of the cylinder. In a few days the upper surface of the concrete was plastered with 1:1 mortar, the surface of the mortar being finished flush with the top of the cylinder. Cylinders treated with each of the waterproofing compounds were made with 6 in each set, and 8 cylinders of plain concrete were made.

The cylinders were broken in a Riehlé Universal testing-machine of 100,000 lbs. capacity at the ages of 35, 62, and 292 days. Three sheets of blotting paper were used at the tops and bottoms of the specimens when tested.

In Table I are given the results of the tests which will now be considered.

(a) *Plain Concrete.*—For some unexplained reason the strength of the plain concrete specimens, marked P, is about 6 per cent less at 292 days than at 62 days.

(b) *Limate.*—This material is a hydrated lime obtained from the Western Lime and Cement Co., Milwaukee, Wis. Four sets of specimens were made, the ratio by weight of Limate to the cement for the different cylinders being 10 per cent, 14 per cent, 18 per cent and 22 per cent, respectively. In each case the Limate replaced an equal weight of the cement. The Limate and cement were first thoroughly mixed by hand. This mixture with the sand was then thrown into the mixer and the mixing process carried on as before described. The specimens marked L10, L14, etc. (see Table I) indicate those in which the Limate is equal to 10 per cent, 14 per cent, etc., of the weight of the cement. As shown in this table, the use of Limate usually increased the strength of the concrete, this effect being especially marked with the L10 and L14 specimens.

(c) *Medusa Water-Proof Compound.*—This is a dry powder furnished by the Sandusky Portland Cement Co. of Sandusky, Ohio. A quantity of the compound equal to 2 per cent of the weight of the cement was thoroughly mixed dry with the cement. Water was slowly added to this mixture while at the same time it was well troweled. The addition of water and the troweling were continued until the mixture was of a damp consistency. It was now thrown into the mixer with the sand, and the mixing completed as before outlined. By referring to Table I it will be seen that the cylinders (mark *M*) treated with this compound were stronger than those of plain concrete at corresponding ages. Furthermore, there is a decided increase in strength with age.

(d) *Aquabar.*—This compound was obtained from the Aquabar Co., Philadelphia, Pa. This is a material in gelatine form which, when properly diluted, is used to temper the mortar or concrete. The compound was thoroughly mixed with water in the proportions of 2 gals. of the compound to 48 gals of water. The concrete for these cylinders was mixed as before explained with this exception, that the Aquabar solution instead of water was used to temper the mortar and the concrete. The results (see Table I) were very unsatisfactory, the Aquabar specimens (mark *Aq*) showing from 46 per cent to 64 per cent of the strength of plain concrete at corresponding ages.

Conclusions.—The following conclusions are drawn as the result of the experiments:

(1) Unless extreme care is taken in proportioning, it is necessary that some form of water proofing be used for a 1:3:5 concrete for pressures from 20 lbs. per sq. in. to 40 lbs. per sq. in.

(2) For nearly all specimens the rate of flow decreased rapidly with time. This was especially marked in the case of the mortar coatings and was due in part to their dry condition.

(3) All of the surface paints were quite satisfactory at pressures of 20 lbs. per sq. in. When subjected to pressures of 40 lbs. per sq. in., Des Moines Elaterite No. 60 and Universal Damp-Proof Compound proved unreliable. The mixture of Flexible Compound and white lead gave good results at both pressures. Century Cement Fluid was not tested at the high pressure and while Antihydrine gave only a small flow at 40 lbs. per sq. in., the results can not be compared with those of the other compounds because the test was carried on under different conditions.

(4) Water proofing materials composed of layers of felt, burlap, or tarred paper, cemented together with a compound, gave excellent results at the high pressure. Not one of the specimens treated with Hydrex Felt and Compound, Siastex Fabric No. 2 and Pitch, and Dehydratine No. 4 and tarred roofing paper showed any appreciable flow.

(5) Coatine was practically impermeable at the two pressures.

(6) The mortar coatings in the case of Antihydro gave good results at both pressures, there being practically no flow after the first 24 hrs. It is possible, however, that its effectiveness was due partly to the method of applying the mortar. For waterproofing used in this manner, it would seem desirable to apply the mortar in two layers after first covering the concrete with a neat cement slush coat. The plain mortar with a neat cement wash was effective at a pressure of 20 lbs. per sq. in. but proved unreliable at 40 lbs. per sq. in. No doubt a plain mortar coating would prove satisfactory in water

proofing concrete at high pressures providing it be applied as just described.

(7) Water proofing compounds that are added to the body of the concrete are worthless at pressures from 20 lbs per sq. in. to 40 lbs. per sq. in. unless great care be used in proportioning.

(8) Limate, when replacing 10 per cent to 22 per cent of the weight of cement, and Medusa Water-proof Compound equal to 2 per cent of the weight of the cement do not impair the compressive strength of 1:3:5 concrete. On the other hand, Aquabar equal to 4⅛ per cent of the mixing water reduces the strength of 1:3:5 concrete by percentages varying from 36 per cent to 54 per cent.

Method and Cost of Constructing Concrete Boundary Monuments.

The accompanying sketch shows the construction of concrete monuments employed in marking the boundaries of the Kennebec Water District, Waterville, Me. These monuments were constructed as follows: A hole 5 ft. or so in depth was made with an 8-in. post hole auger and then the bottom portion of this hole was enlarged to about double this diameter with a spoon. The hole was then filled with concrete in which were embedded at each corner ¼-in. steel bars bent in U-form across the top of the monument. The excavation formed the mold for the concrete except for the top portion which was molded 6 ins. square, with chamfered corners, by means of wooden forms. In mowing fields or grass lands the top of the monument was made flush with the ground and the square top was 6 ins. in length; along fence and property lines the monuments extended 1 ft. above the ground surface and the square molded top was made 16 ins. long. The form used for molding the square top is shown by the illustration. In the top of the monument at the center there was embedded a cast iron mark plate shaped as shown by the sketch to hold it firmly. This plate bore the letters K. W. D. and the number of the monument, as K. W. D 27. The concrete used was a 1:2:4 ½-in. stone or gravel mixture.

The cost of these monuments was about $4.30 each, including materials, supplies, forms, teaming and supervision. The number of monuments constructed in three months and their costs were as follows:

Month.	No. built.	Total cost.	Cost per mat.
September			
October			
November	15	65.25	4.35
Total			

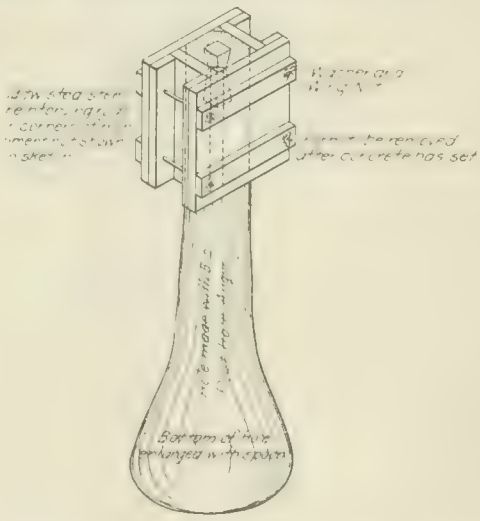
This includes $1 per day for district horses but does not include cost of forms which amounted to between $4 and $5, making the total average cost per monument in place $4.30. These figures are furnished by Mr. Leonard Metcalf, civil engineer, Boston, Mass., under whose direction the work was done which included this monument construction.

Some Data and Records of Experience Regarding the Disintegration of Concrete by Alkali.*

It is well known, of course, that alkali is present in greater or less amount in the soil of the arid regions. In the disintegration of the rocks, the minerals have been broken down into mineral salts which have remained in the soil as soluble salts. The rainfall and the drainage of the region are insufficient to carry these salts out of the soil through the subsoils and eventually into the streams and rivers, as is the case in the more humid regions.

A good many, if not all, of the projects of the Reclamation Service are located in alkali regions, and, thus far, the attention of the engineers has been directed to the failure of concrete structures on only two of these projects—one in Montana and one in Wyoming. These failures may indicate some special peculiarity of the local soil, and may be somewhat similar to the well-known fact that the action of sea water has been destructive to concrete in certain localities and not in others.

The Service has started an investigation, which is still continuing, and the chemist's report has not yet been published, but Mr



Concrete Monument for Marking Boundaries.

Jewett, the cement expert of the Service, in a paper before the American Society for Testing Materials, set forth some of the conditions, as will be shown by the following extracts:

On the Sun River project * * * its effect has been noted in the disintegration of a number of small structures, such as pipe culverts, which are partially submerged in the small streams carrying the drainage of the surrounding country. The effect of this water in causing the disintegration of the concrete is noticed, both in the softening of the material where constantly submerged for a period of three or four months, and also more particularly in the breaking up of the structure at the line where the water rises and falls, or, in other words, where there is a submersion followed by a drying out, followed by another submersion, etc. This process brings about a breaking up of the structure, similar in appearance to that of the effect of freezing, only much more severe. It is described by the engineer in charge of this work as follows:

"On examination of some of the concrete culverts which have been in place in alkali water for three or four months, the part under water is much softer than the part above water, but the greatest effect of the alkali seems to be at the water surface. Have examined pieces of these culverts taken from below water level and found, by microscopic examination, minute crystals which disintegrate on being exposed to the air and become a fine powder. This process of crystallization has an enormous expansive force, the same as freezing, and this undoubtedly has an enormous disintegrating effect. One culvert which had been in alkali water several months had no strength at all and was like so much sand and mud at the water level."

In studying the cause of this disintegration it seemed that a chemical analysis of the water producing these results would be the first step of importance to be taken. The results obtained from an analysis of this water are as follows:

	Milligrams per liter.
Calcium sulphate ($Ca\ SO_4$)	1 690
Magnesium sulphate ($Mg\ SO_4$)	6 870
Basic magnesium carbonate ($MgH_2\ CO_2$)	305
Magnesium chloride ($Mg\ Cl_2$)	192
Potassium chloride ($K\ Cl$)	20
Total solids	9 077
Weight after ignition	8 855
Loss on ignition	222

From this analysis it will be seen that the principal mineral ingredient of this water is magnesium sulphate, and this leads to the conclusion that the effect of this water in causing disintegration of concrete is similar in its action to that of sea water in which magnesium sulphate is stated to be the principal substance acting to bring about the disintegration of concrete with which it comes in contact.

Professor Headden, of the Colorado State Agricultural College, has at various times issued bulletins in reference to alkali in the soil and in the water, and has recently added to his publications Bulletin 132 on "The Destruction of Concrete by Alkali," in the course of which he gives an account of his investigation of cement tiling which had rapidly deteriorated. From that bulletin the following is quoted in order to convey clearly the conditions.

The following case of deterioration may be of some interest as it presents some new points. There were sent to me some months ago a number of fragments of tiling which had been laid but from eight to nine months. They had been disintegrated to such an extent that one of the samples was simply a white putty-like mass mixed with sand. There was nothing about this sample remotely suggestive of concrete. Another of the samples consisted of a fragment of the tile, the interior portions of which had been wholly decomposed, while there still remained an outer and inner portion in good condition, or comparatively so. Another sample had been attacked in the inner side, leaving the mass of the tile outside of the zone of decomposition apparently sound. The line of decomposition was sharply limited and showed distinctly, but even in this case there remained a thin layer of cement on the inside.

I do not know whether the tile were running full of water or not, probably not, as the fragments seem to be parts of 16 or 18-inch tile. The importance of this point is simply this, that it would answer any question in regard to the separation of solid "alkali" salts on that portion of tile above the water line. That such a separation of these salts should take place does not seem very probable in this case.

The point of attack, so far as the samples at my disposal indicate, is either in the center of the cement mass or near the inner surface. In either case we are almost compelled to assume the action of the water, i. e., of the salts held in solution. At the same time we see the resisting power of the outside and inside surfaces, which are evidently richer in cement than the inner portion of the mass of the tile.

The sand used in making the tile was quite fine. The proportion used was 5:1. We can readily see that the individual masses of cement in the interior mass of the tile must be small and readily attacked by solutions of salts capable of reacting with the cement.

It seems quite evident that the agents causing this disintegration of the cement must gain access to the interior portion of the mass of the tile in the form of a solution, but it is a question whether this solution is the same in strength and character as the water in the drain. I think that I have clearly shown in Bulletin 65 of the Colorado Experiment Station, page 34, that the water soluble portion of the

*Abstract of a paper by G. G. Anderson, Proceedings American Society of Civil Engineers, Vol. XXXV, p. 1352.

soil is different from the salts held in solution in the ground water. Further, in Bulletin 72, page 28 et seq., that the ground waters are different from the drain waters, and the action of these waters on the tile would vary somewhat according to the source of the solution which penetrated the mass of the tile.

The drain waters obtained, say at a depth of four feet, contain as a rule a smaller amount of salts in solution than the ground water. The salts present are the same, but their relative quantities vary. The usual salts present in the ground waters are, sodic sulfate, calcic sulfate, magnesic sulfate, sodic carbonate, and sodic chlorid, in some instances also magnesic chlorid. In the drain waters we have the same salts, but their relative quantities are different, the most notable feature being the relatively large amount of sodic carbonate.

The substances claimed to be the most active in effecting the disintegration of cement are the sulfates. In the case of sea water the explanation offered is that the lime of the cement decomposes the magnesic salts present in the water, whereby the lime goes into solution and the magnesia is deposited in its stead, causing a bulging and disintegration of the work owing to its greater bulk. The principal magnesian salt in sea water is the chlorid, the deleterious action of which on cement is not established, but it has been shown that magnesic sulfate acts energetically. The most active agent in decomposing concrete is the sulfuric acid of the sulfates carried in solution. Again, solutions of gypsum have been shown to act detrimentally on concrete by forming with the tri-calcic aluminate a sulfo-aluminate.

The water acting on these tiles, whether it be ground water or drain water, is very bad. One of the two small samples sent to me contained 1 252.6 grains per imperial gallon, of which 493.5 grains were sulfuric acid (SO_3) with an extremely large proportion of magnesia. The other contained 542.3 grains per imperial gallon, with 42.31 grains of magnesic oxid or 7.8 per cent of the total solids. I have examined a number of waters from this section, and find the ground water uniformly heavily laden with the sulfates of lime and soda, with comparatively large quantities of magnesia, especially if the water comes from near the surface, as it necessarily must in the case of drain waters. In addition to the above constituents, there is uniformly some carbonate present, which for the present purpose we may consider as sodic carbonate.

We have then an ample supply of these substances present which are known to act deleteriously upon cement, i. e., the sulfates, a portion of which is magnesic sulfate, and in addition there is so much sodic carbonate present that its action cannot be neglected.

Professor Headden, assuming that the cement used in the tiling was an average Portland cement, with not more than 2 per cent of calcic sulphate, then considers the action of the waters on the tile. The white decomposition product indicated the presence of a large quantity of water, also of considerable quantities of sulphuric and carbonic acids. The decomposed mass was washed with distilled water, and the wash-water showed that it had taken sulphuric acid, lime, and soda into solution.

An analysis of the Arkansas River water at Rocky Ford, which, Professor Headden remarks, is essentially a return water, is given, and the assumption is made that the composition of the water acting on the decomposed tiling was much the same, as are all waters in that district, varying in amounts of mineral matter, or total solids held in solution, as shown by the two samples of drain water accompanying the tiling—one having 1,252.6 grains, the other 542.3 grains.

The action on the tiling seems to be similar in Colorado and Montana. A comparison of the features of construction may not be possible.

In the Montana case, Mr. Jewett says:

Of course, in this case, as in any other case of concrete failure, the question of poor workmanship is one of the first to be considered and it should be noted that the work in question was carried on by force account under direct supervision of employes of the service and not by contract, and was done in the usual thorough and substantial manner, in which all of the construction work of the service is carried on. After taking all the evidence into account there seemed to be no other conclusion but that the action of the alkali water was directly responsible for the results noticed.

Professor Headden has not much information on the quality of the tiling examined by him. The sand used was quite fine, the proportion 5 to 1, and the individual masses of cement in the interior must have been small and readily attacked by solutions of salts capable of reacting with the cement.

Both Mr. Jewett and Professor Headden find the decomposing action, in the cases of these tilings, to be similar to that of sea water, in which magnesic sulphate is stated to be the principal agent. Professor Headden says, as already quoted.

The principal magnesian salt in sea water is the chlorid, the deleterious action of which on cement is not established, but it has been shown that magnesic sulfate acts energetically.

Reference to this similarity to the action of sea water will be made later; meantime, the following is a summary of Professor Headden's conclusions.

The analysis may be interpreted as indicating that the cement had been deprived of silicic acid and of a relatively large amount of lime. The amounts of the ferric and aluminic oxides have been reduced to about one-half as much in the decomposed cement as in the original. The sodic sulphate, more particularly the calcic and magnesic sulphates which are present in the ground-water, will at the same time act on the tri-calcic aluminate, forming the sulpho-aluminate, which crystallizes with 60 molecules of water and is soluble. The increase of sulphuric acid (more than 20 per cent), and also of carbonic acid (more than 12 per cent), in the water-free decomposition product is noted, as compared with only about 1 per cent each in the original product, while magnesic sulphate has also contributed to the result, being more than four times greater in the decomposed product than in the original; and there is the conclusion that:

The action of the ground waters seems to have been one of chemical change, converting the lime of the cement into a sulfate and carbonate accompanied by the removal of silicic acid, alumina, and lime, and totally destroying the cohesiveness of the concrete.

The case of the sewers at Great Falls, Mont., has been referred to frequently, and is probably the most striking illustration of deterioration yet considered. The city engineer, Mr. C. W. Swearingen, was so impressed by the conditions that he requested the authorities at the Montana State Agricultural College to investigate and report on it.

The preliminary conclusions of Mr. E. T. Tannatt, rural engineer, and Mr. Edmund Burke, chemist, are embodied in Bulletin No. 69 of the Montana Experiment Station, from which the following extracts give a very clear exposition of the conditions:

The Third Street main sewer was constructed in the year 1890, the material used being Portland cement pipe of home manufacture, made in moulds and put in place after the cement had hardened. Sewer is oval in shape, dimensions 26x32 inches. This sewer, after a comparatively short term of service, showed defects of so serious a character as to necessitate rebuilding portions of the same. The remaining portion of this sewer has disintegrated in many places and occasionally portions of the pipe are gone; the cement in places has the appearance and consistency of fresh lime mortar.

The Sixth Street main was constructed in the year 1892, the material being the best grade of common brick of home manufacture. Sewer is circular in form, four feet inside diameter, two rings of brick laid on edge in imported Portland cement mortar, outside plaster coat one-half inch thick, not plastered on inside; all cement mortar one part cement and three parts sand. The masonry in the invert in this sewer is disintegrating throughout its entire length, the defects being confined almost entirely to the invert and lower sections of the manholes; the arch is in apparent good condition.

There is no sub-drain under, nor on the sides of the sewer. As stated before, the disintegration in the Third Street main, where cement pipe was used, commenced soon after its construction, whereas the Sixth Street main gave no evidences of defect for about seven years after its construction, and it is only during the past four years that decomposition has been rapid.

The examiners found (a) that the disintegration and destructive action of the cement did not come from adulteration nor from the quality of the materials used; (b) that though a limited chemical or physical action of the alkali salts may be a partial cause of the breaking down of the brck, yet the principal cause was the fact that the bricks were too soft and not fit for sewer construction; and (c) that the action on the cement was chemical, that the destructive agent came from the outside of the sewer, and that the disintegration of the cement cannot be charged to any action of the sewage or gases from the same.

They found that certain portions of the sewers showed the presence of external moisture to a more marked degree than other sections, and that, contiguous to it, were various depressions in which water collected and gradually seeped into the soil, thereby affording means for the leaching out of the alkali from the gumbo, through the sand and other more permeable formations, into the back-filling adjoining the sewer, there depositing against the structure. The soil samples showing the highest percentages of alkali were taken immediately at the back of the cylinder of the sewer.

Soil samples were analyzed in order to ascertain the amount of alkali salts, whether these were being leached out and lodged against the sewer, and the amounts at various depths, but there is no chemical investigation of the action on the cement and its alteration, which it is understood will form the subject of a later bulletin.

The analyses embodied in the report, however, show that the maximum disintegration of the sewer occurred where the greatest percentage of alkali showed in the soil, and that the ground waters were leaching the alkali from the soils and depositing the salts along the sewer.

Messrs. Tannatt and Burke consider that the use of cement for sewers and other structures in alkali soil is inadvisable in cases where it is not possible to drain all ground waters from the exterior of the sewer, and they recommend that drain tile be placed in the bottom of the trench, covered with clean gravel or crushed stone, and that similar drains be placed around the barrel of the sewer to provide effective drainage of the ground waters, in order that it will not be possible for them to come into contact with the structure itself, and where these precautions cannot be taken they "unhesitatingly recommend that cement pipe be not used."

The writer had some experience with a construction somewhat similar to the Great Falls sewer, and in similar, though not such aggravated, conditions, but with entirely different results.

Lake Loveland was constructed under the writer's supervision in 1894. The outlet is a tunnel about ¾ mile long, nearly all of which is in stratified shale. The rock was of such a character that it would have decomposed under the action of passing waters at a high velocity, and therefore the tunnel was lined. The interior diameter of the tube was 5 ft. The invert was built of two rings of well burned brick, and the arch was of concrete.

In the excavation, large volumes of water were developed, ultimately giving a flow of about 2 cu. ft. per second. The water undoubtedly was impregnated heavily with alkali, but the writer did not obtain a chemical analysis of it, as at that time he did not suspect that any deleterious action might be caused by the character of the water itself; but apart from the fact that it was "return water"—the drainage of a large section of

irrigated country lying west of the reservoir—there were constant physical evidences that it contained salts, if one might judge from the action on the human system caused by drinking it in moderate quantities.

Through the whole length of the tunnel a sub-drain was channeled out in the rock bottom, and wooden boxes were placed to convey these waters. Side drains were also placed at frequent intervals throughout the whole length, and mostly where the volume was largest, always connected with the under drains. These were carried up as high as the drainage showed, usually to the spring of the arch. In short, every precaution was taken to prevent the water from coming in contact with the concrete, certainly until it had set thoroughly, and solely for the purpose of securing good results and without thought of any ultimate chemical reaction.

The work was done practically by force account. The materials were supplied, the labor was done under contract, and the work was in charge of a competent concrete worker and under a thoroughly able inspector.

As far as the writer knows, the concrete and the cement mortar in the brickwork are in thoroughly good condition today. It is nearly 8 years since he examined the work, and then it was found to be without any apparent defect. The superintendent informed the writer recently that he had not been in the tunnel for 2 years, but had then found it in perfect condition, and was of the opinion that it still is so.

One other structure may be mentioned, a reservoir spillway in the Arkansas Valley, or the Bob Creek Reservoir, constructed and owned by Mr. W. C. Bradbury. The writer's attention was attracted to it in September, 1909, when passing near it on other business. He first noticed and examined a small division head gate about ½ mile below the reservoir. It was stated that these works had been built less than 2 years before that time. The writer had no means of knowing the proportions used in the work, but this head gate seemed to have been fairly well built, and its upper portion was in fair condition. The floor had evidently been about 6 ins. in thickness, but it was entirely decomposed and could be crushed readily in the hand. The uprights, up to about the normal height of the water, showed disintegration. At the outlet from the reservoir the apron was disintegrated in the same way. It had been reinforced and the reinforcing material was exposed and bright, while the concrete mass was almost completely pulverized.

The spillway to the reservoir was of considerable length and height, of ogee overfall, and had the same appearance of fairly good construction. Prior to the writer's visit there had never been any water flowing over it from the reservoir. Its lower portion, for a height of about 10 ft. above the apron level, was markedly discolored, and on breaking the surface crust it was found that the interior mass of the concrete could easily be removed and pulverized in the hand.

About a month later water passed over the spillway and washed out the lower section of the fall to the height already indicated. The concrete had been placed on a foundation of shale, from which the alkali water oozed. No provision had been made for the under drainage of this water, and the conclusion is inevitable that the destruction of the concrete was the result of the chemical action of the alkali in the water draining from the shale.

From these various instances it would seem that somewhat new problems are presented to the constructing engineer, or if they are not new they are old problems under new conditions, and engineers have been prone to overlook their significance until serious consequences have forced them directly on their attention.

It is very likely true that the effects of alkali on concrete are similar to those of sea water, with some differences, as these in themselves differ in various localities. Means of overcoming the sea water action are fairly well outlined, though as competent an authority as Feret says:

> No cement or other hydraulic product has yet been found which presents absolute security against the decomposing action of sea water.

Michaelis, on the other hand, long ago made certain recommendations which may be summarized briefly here: From the physical point of view a dense concrete surrounded with an impermeable layer composed of 1 part of cement and 2 or 2½ parts of sand of mixed grains, of which at least one-third must be very fine, and the whole mass made if possible in one operation; from the chemical point of view the use of cement rich in silica and as poor as possible in alumina and ferric oxide and the use of substances which render the mortar, at any rate in its external layers, denser and more capable of resistance.

The solution of the problem, from the chemical point of view, will be the care of the chemists and the cement manufacturers. The problem for them is as new—or as old under new conditions—as it is for the engineer, and conceding the general proposition that the solution lies in good construction, which the engineer must realize and will provide, there is, it would seem, the larger problem of a coating which, adding impermeability, shall also resist the chemical reactions between the soil and water and the cement.

What is good construction under these conditions?

It seems to the writer that the engineer, under these conditions, first has to extend materially the field of his investigations before outlining plans. The character of the soil and of the water passing over the soil and to be transported over the structure must be thoroughly analyzed. Then to the physical problem similar analytic consideration must be taken of the materials used as concrete aggregates—the sand, the gravel, and the water.

On that feature the following is quoted from Mr. Jewett's paper:

> In the case of the sand used on the Reclamation Service project above mentioned, the engineers reported that there were evidences that this sand, which was the only supply readily available, contained alkali or some substance making it chemically active and assisting in the disintegration of the concrete. A chemical analysis of this sand was therefore obtained and resulted as follows:

	Per Cent.
Silica ($Si O_2$)	67.03
Alumina ($Al_2 O_3$)	6.85
Ferric oxide ($Fe_2 O_3$)	2.50
Manganese oxide (Mn O)	.02
Lime (Ca O)	10.72
Magnesia (Mg O)	1.72
Sulphuric anhydride (SO_3)	Trace
Alkalies—	
Soda ($Na_2 O$)	1.74
Potassa ($K_2 O$)	1.51
Water at 100° C.	.14
Ignition loss	8.16
Total	100.39

> This sand gives excellent results from physical tests, but since, as will be seen from the above analysis, the alkali content is about 3 per cent, which would correspond to about 15 to 20 per cent of feldspathic material, and that it also contains a considerable percentage of limestone, it is altogether possible that this sand would be more readily acted on by the influences tending to disintegrate the concrete than a sand of a more highly silicious nature.

It is extremely likely that similar conditions will be found in most of the sands and gravels available in the arid regions where alkali is known to exist.

There is no occasion for elaboration on the care required in the selection of water for use in mixing concrete. It is quite well known that the ground and drain waters in most of these districts are largely impregnated with alkali; that is discernible without chemical analysis, and is particularly true in the lower reaches of irrigated valleys, where most of the waters are drain waters, consisting of the concentrated essence of alkali from the irrigation and drainage of the upper valleys. Prior to the introduction of the gravity system at Greeley, for instance, the domestic supply from underground galleries contained as much as 1,800 parts of hardness and, it may be added, the water used in mixing the concrete at the Loveland work referred to was obtained not from the drainage of the tunnel but from the town supply withdrawn from the river inside the foot-hills.

If the action of the alkali salts in the water surrounding a concrete mass can have the destructive effect shown in the various instances quoted, it is certain that the incorporation of such water in the aggregate cannot be other than injurious.

Beyond extra care in the materials and the production of a dense mass, there is no room to doubt the advisability of effective drainage around the structure.

Professor Headden, in Bulletin 72*, speaking of the alkali lands in the Poudre Valley, said:

> I am convinced that the only question of alkali that we have resolves itself into one of drainage, and beyond this, there is no alkali question for us.

It would be too much to hope that the drainage around structures would as effectively solve the difficulty of alkali in contact with concrete, but it will aid in resisting the action of the agencies at operation.

It is not possible, however, in all cases to provide such drainage as would be effective, and beyond all that—beyond the external application and the possible incorporation of an impervious coating in the mass itself—it seems to the writer that there must be added to it or in it, in some form, agencies which will counteract the effect of these apparently well recognized chemical elements which bring destruction, and that must be left to the chemist, on whose province the writer has probably encroached too far, and apparently with only a speaking acquaintance with that science.

Waterworks in Peking, China.—The new waterworks in Peking, China, have been completed in a trifle less than one year by a German company. The contract price is said to have been $1,000,000.

The resident area to be supplied by the waterworks contains a population of about 700,000 (128,000 families), among which cholera, smallpox, typhus, and other contagious diseases have been more or less prevalent. The use of pure water, together with the benefits of the system of removal of garbage and cleansing the streets initiated by the city police department, will tend greatly to reduce, if in time not entirely to eradicate, these diseases. Peking is situated in one of the most healthful climatic zones in China, and with proper sanitary precautions should show as low a death rate as the average American and European cities.

The waterworks are to be administered solely by Chinese. The cost of water to consumers will, it is said, be less than 40 cents per 1,000 gallons.

The water is taken from the Shaho River, which rises in the hills west of Peking and is an unusually clear water stream. It passes through no villages. The pumping plant consists of two centrifugal pumps having a combined capacity of about 5,000 gallons per minute, or about 10 gals. per capita, a decided contrast to Chicago and New York with over 200 gallons per capita.

The settling tanks were furnished by the Riter-Conley Company, of Pittsburg, Pa. Patented steel mains have been used, and the Ludlow Valve Manufacturing Company, of Troy, N. Y., has furnished the valves, hydrants, water gates, etc., for the system

---

The total original supply of coal in Arkansas is estimated by M. R. Campbell, of the United States Geological Survey, at 1,887,000,000 short tons, of which 1,797,000,000 were lignite. The lignite areas have not been developed and no production has been reported from them. From the bituminous and semi-anthracite areas there has been mined, to the close of 1908, a total of 25,834,758 short tons, representing an exhaustion, including waste, of approximately 39,000,000 tons, or a little more than 2 per cent of the estimated original contents of the Arkansas fields.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Cost of Boring Five Test Wells for a Double Track Railway Bridge in California.

BY P. J. ROBINSON *

The American River of California is a harmless stream during the summer or dry period, but as soon as the winter rains set in, it assumes proportions creditable to much larger rivers, and has been known to rise 15 ft. in less than 24 hours.

During January, 1909, an unprecedented rise occurred, which left destruction in its wake on every hand, and undermined one of the concrete piers of a large railroad bridge near Sacramento, carrying away two deck plate girders spans of 100 ft. each. In view of increased traffic conditions, improvements had been contemplated before the disaster, but now it was decided to take immediate steps towards the construction of a double-track structure, a short distance down stream from the old bridge, thus effecting a reduction in curvature on the approaches at either end. Accordingly test wells were bored to determine the nature of the foundation for the new piers. The original plans called for 6 wells, but only five were bored. Stagings were erected from the side of the old bridge, and the equipment used, which consisted of a gasoline hoist and drill machine, was rented from a local well borer, who also supervised the work. Three crews prosecuted the work at the start, ending with one, with wages as follows:

Engineer	$4.75
Foreman	4.00
Sub-foreman	3.75
Sub-foreman	3.50
Sub-foreman	3.25
Laborers	3.00
Laborers	2.75
Laborers	2.50
Laborers	2.25

A suction sand pump, a design of the local shops, was used through the gravel and cobbles and an earth auger in the clay. The wells were encased with sheet iron and when possible the pipe was pulled and used again. The prices charged for this material are shown in the cost statement and the wide range in cost of the different sizes is due to the fact that the 14-in. and 12-in. pipe were new, while the 10-in. and 8-in. were second hand.

The work was twice interrupted by high water, necessitating the dismantling of the equipment, and thereby adding quite materially to the cost.

The method of recording the progress of the work is shown on the accompanying diagram and is unique in that it furnishes a complete record of all the details and is a permanent part of the records for future reference. The cost of this work was as follows

Labor:		
Loading and unloading material, 63½ days	$	197.00
Hauling material, 2 days		6.50
Boring well No. 1, 107 days		324.25
Boring well No. 2, 52 days		165.75
Boring well No. 3, 131½ days		417.62
Boring well No. 4, 51½ days		171.50
Boring well No. 6, 117½ days		360.00
Erecting staging, 68½ days		236.81
Repairing derrick, 2 days		7.00
Making boxes of test well soils, 4 days		15.00
Rental of well boring apparatus		118.00
	$	2,019.43
Material:		
Lumber, 9,073 ft. B.M. at $13.83 per M	$	125.47
Sheet iron casing, 14-in., new, 52 lin. ft. at $2.75		143.00
Sheet iron casing, 12-in., new, 172 lin. ft. at $2.25		387.00
Sheet iron casing, 10-in., second-hand, 49 lin. ft. at $0.60		29.40
Sheet iron casing, 8-in., second-hand, 36 lin. ft. at $0.51		18.36
Store department expense		40.55
2% of labor for use of tools		40.40
		784.18
Total	$	2,803.61

No. lin. ft. bored, 534.5—cost per ft., $5.25.

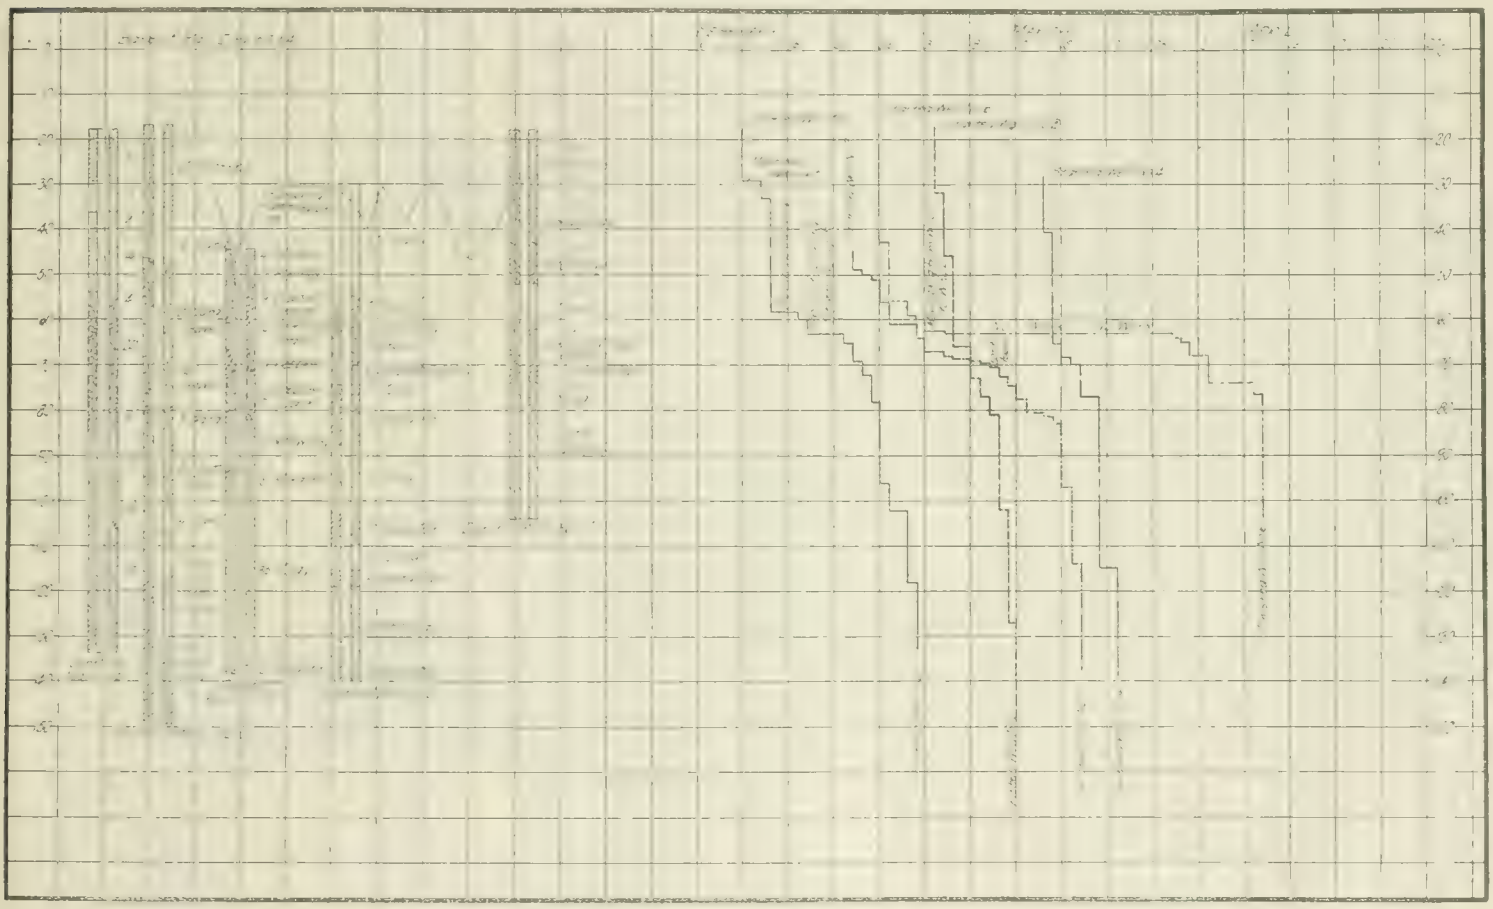

Diagram for Recording Progress and Character of Test Borings.

Of the five wells bored, No. 1 and No. 6 were on the bank and Nos. 2, 3 and 4 were located in the channel of the stream. It is noted that well No. 3 was the most expensive to bore, due to the nature of the substance penetrated.

"We adopted meters at Wellesley in a small way from the opening of the works in 1885. In 1893 we had 560 in use, as against 164 in the previous year. In 1891 we pumped 92,400,000 gals. On the introduction of meters our consumption began to decrease and although takers steadily increased we did not reach a consumption of 93,800,000 until 1902, eleven years later. At the present our consumption is 45 gals. per day to each consumer and 44 to each inhabitant."—Extract from the report of Mr. Frank L. Fuller, C. E., of Boston, Mass.

*Assistant Engineer Southern Pacific Co., Sacramento, Cal.

Data on the Storage and Handling of Explosives.*

In open air quarrying an explosive may be employed that produces a long flame or gives off poisonous gases or shatters the material, whereas in coal mines these are all points to be guarded against. Flames may ignite gases present in coal seams, poisonous gases in the confined tunnels are dangerous to workmen, and undue shattering of coal wastes it and means misdirected labor.

Explosives commonly used for blasting purposes, containing nitroglycerine, should be kept frozen until required. The temperature should be kept constantly close to 35° F. To keep nitroglycerine explosives permanently thawed the temperature should not go below 52° F. A

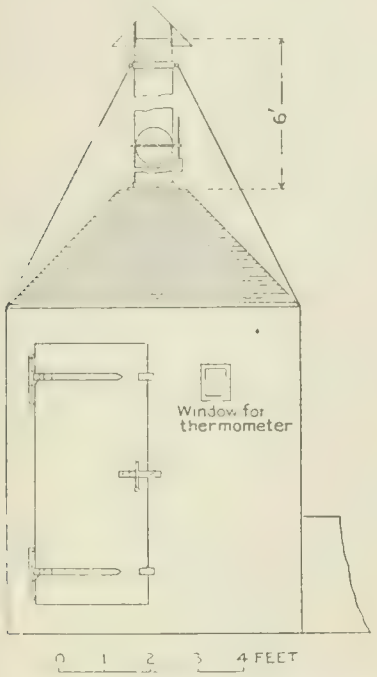

Fig. 1—Elevation of Thaw House for Frozen Explosives.

high temperature renders them more sensitive to explosion and some decompose at high temperatures, so it is best that the temperature in magazines in which they are stored should never rise above 90° F.

Explosives should not be exposed for any length of time to direct sunlight, because this may lead to decomposition in those containing nitroglycerine, nitrocellulose, nitrostarch, or substances of that kind. Explosives should be stored in a dry place, for many of them contain considerable quantities of ammonium nitrate or of sodium nitrate and so will take up moisture from damp air and become damp. Too great dampness makes the explosive not only harder to fire but weaker when fired. Besides, if the explosive is damp the nature of the gases produced will be different. Moreover as bodies like dynamite become moist, the nitroglycerine contained in them tends to run out; that is, what is called exudation takes place, and all the dangers follow that belong to liquid nitroglycerine.

On the other hand, explosives should not be kept in an extremely dry place, for all of them as made contain some moisture and if the place of storage is very dry the explosive may lose this moisture. Such a change in composition will affect the explosive so as to change the speed with which the explosive reaction takes place within it, and therefore the character of the work which it does when exploded. Naturally the longer an explosive is kept in storage the greater are the chances that change will take place in it, and therefore the explosive should be obtained in as fresh a condition as possible and should be used as soon as possible after it is received. Also it should be kept stored in its original packages in the magazine until wanted for immediate use, and then used promptly.

The paraffine wrapper used in making the dynamite up in sticks is to keep the moisture from the contents of the cartridges. As rough handling readily breaks the folded edges, cartridges should be handled with great care. The necessity for handling cartridges with care to prevent an explosion is pretty well understood, but it is also necessary to handle them carefuly to prevent them being spoiled by moisture. They are best carried to the place where they are to be used in the cartons in which they are bought.

Dynamite sticks should never be thrown or dropped and portions of powder falling from the cartridges must be carefully guarded against friction, blows or fire. It is best that only one kind of explosive be kept in any one magazine. If more than one kind of explosive should be kept in the same magazine, it should be divided into rooms and the different explosives kept in the different rooms. All firing devices should be kept in a dry place by themselves.

The greatest care must be taken to prevent packages of explosives from falling or getting shocks. They must not be thrown, dropped, nor rolled. Wooden boxes containing explosives should be opened with extreme care, so as to avoid friction and blows as much as possible. They should never be opened within the magazine, but in a properly sheltered place outside of the magazine and at a distance from it. They should be opened only by the use of a wooden mallet and a hardwood wedge.

The thawing of frozen explosives requires extreme care, and doing it improperly has frequently led to most serious accidents. No attempt should ever be made to thaw a frozen explosive by placing the cartridge before a fire, or near a boiler, or on steam pipes, or putting it in hot water, or by placing it in the sun. While thawing, nitroglycerine explosives are extremely sensitive and should be handled with great care. During the thawing the nitroglycerine tends to separate from the dope and run out from the cartridge and this is a source of danger.

When but a small amount of the explosive is required, it may be thawed in the thawers that are furnished by all the manufacturers of explosives and have been found safe for use as directed. The thawer consists of a water-jacketed tin vessel, in which the cartridges are placed and which is closed with a tin cover. Before the water is placed in the vessel it is warmed up to a temperature not uncomfortable to the hand put into it, and the cartridges are allowed to remain in the thawer until it is found, by gently pressing them, that they are completely thawed throughout. When thawed, the material will feel plastic between the fingers. When frozen or partly frozen the stick will feel more or less rigid and hard. It is necessary that the stick should be thawed completely, because dynamite when frozen can be detonated only with great difficulty and any part that is frozen will be but imperfectly detonated in the hole; hence not only may such partly frozen powder fail to give its full effect as an explosive, but there is danger of a serious accident where such powder is used.

Where large quantities of explosives are used daily, a small thaw house should be provided. Figures 1 and 2 illustrate a satisfactory thaw house and the Chicago specifications for a contractor's thaw house are given in ENGINEERING-CONTRACTING for Dec. 29, 1909. All powder manufacturers will furnish on application plans and specifications, together with a bill of material, for a thaw house which should be large enough to hold all the explosives used in one day's work. It should be heated by a small hot water heater, placed at least 4 yards from the house, the hot water being passed into the house through iron pipes at such a rate that the temperature in the house will not at any time be above 90° F.

Thaw houses are intended only for the treatment of explosives for immediate use and not for the storage of explosives, for if powders or dynamites are left in this high temperature and dry air for a considerable time the moisture that is a proper part of them will be driven off and, as stated before, this will markedly alter the character of the powder or dynamite and may lead to accidents in its use.

By the use of electric detonators (also

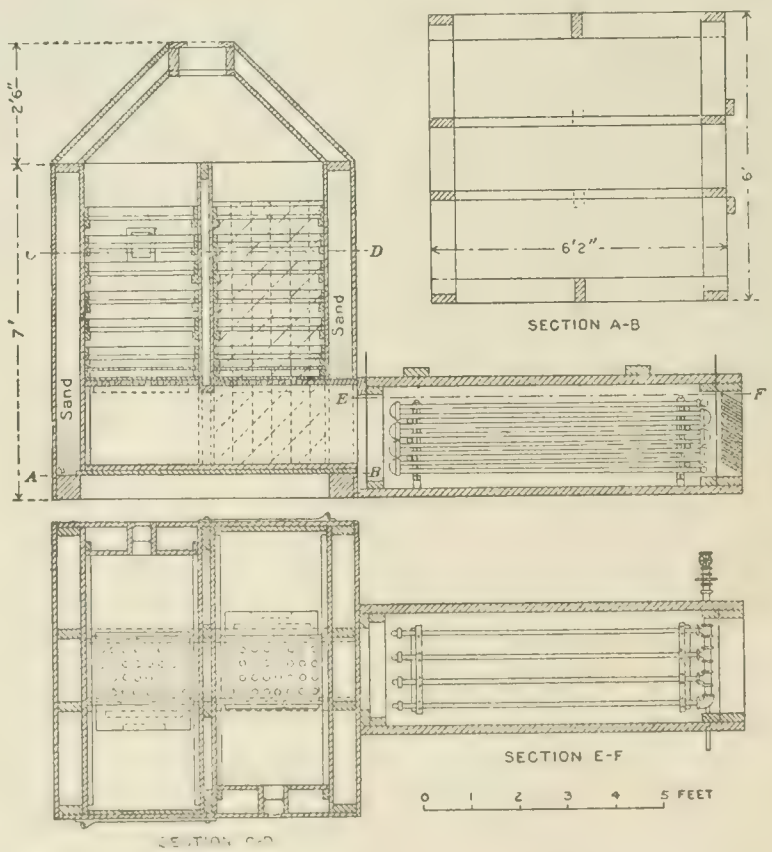

Fig. 2—Section of Thaw House for Frozen Explosives.

*Abstracts from "A Primer on Explosives," by Charles E. Munroe and Clarence Hall; being Bulletin 423, U. S. Geol. Survey.

called electric fuses) the dangers that are common in the use of squibs or fuse in gaseous coal mines are avoided. These electric detonators (see Fig. 3) are simply ordinary detonators that have been fitted with a means of firing them by the electric current. This is done by inserting within them two copper wires, joined at the inner ends by an extremely fine platinum or other high resistance wire, which, like the carbon filament in the ordinary incandescent lamp, becomes heated till it glows when an electric current is passed through it. This wire, known as the bridge, is placed above the detonating compo-

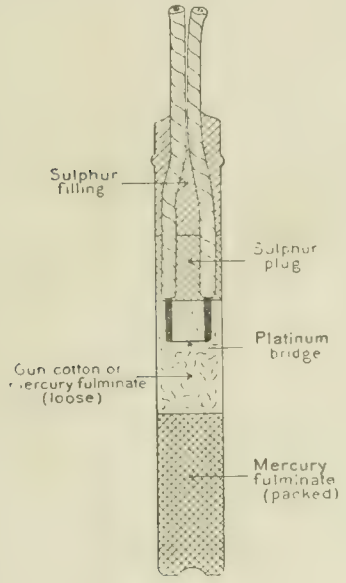

Fig. 3—Electric Detonator.

sition and is surrounded by gun cotton or loose fulminate. The space above it and the mouth of the capsule are then filled and closed by means of a plug of sulphur or other water proof composition, which is poured in while soft. The copper wires pass through the plug and are long enough to extend outside the capsule. These outer ends are called the legs or wires of the electric detonator. Although the copper wires are bare within the electric detonator, the legs outside are covered with an insulating wrapping. These legs are made of different lengths in order to suit different depths of bore holes. The charge of detonating composition differs in the different grades of electric detonators so as to give different strengths.

The following table gives the grade and weight of charge for the more common electric detonators:

Testing-station grades	Commercial grades.	Wght. of charge in grams.	Wght. of charge in grains
No. 5.....	Single strength.. .	0.80	12.3
No. 6.....	Double strength...	1.00	15.4
No. 7.....	Triple strength....	1.50	23.1
No. 8.....	Quadruple strength	2.00	30.9

In loading bore holes electric detonators are placed in the charge just as detonators

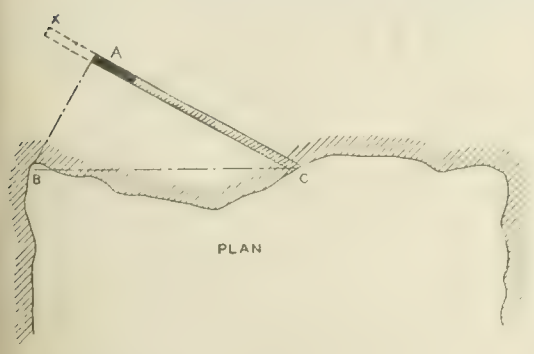

Fig. 4—Shooting Off the Solid.

with fuse are, and the bore holes are tamped in a similar manner. To fire the charge, the legs of the detonator are connected by leading wires to an electric device at a safe distance, and from it the current is sent to fire the blast. No flame can escape from the bore hole during the firing, for the tamping fills the hole completely, and hence blasting in gaseous mines is made much safer.

Only electric detonators are used at the Pittsburg testing station in the tests of explosives for use in mines.

What are called delay action electric "exploders" or detonators are now being offered for use where a number of holes are to be fired at once, but so that the charges may explode one after another. This is done by placing a piece of fuse or other device in the electric detonator between the detonating composition and the bridge and inclosing the whole so that the flame may not escape from the blast hole. In the present state of knowledge this practice is not commended for use in coal mines.

Fulminate of mercury is extremely sensitive to heat, friction or blows and to the extreme violence of the explosion which it undergoes. All these properties therefore belong to detonators and electric detonators, and these little devices should be treated with the utmost respect. Never attempt to pick out any of the composition. Do not drop them or strike them violently against any hard body. Do not lay them on the ground where they may be stepped on. Do not step on them. Use the utmost care when crimping and never crimp with the teeth. They should be stored in a dry place in buildings apart from explosives. They should never be carried with other explosives nor placed near other explosives except in bore holes. When carried or shipped they should be packed with a quantity of elastic material.

Figure 4 illustrates a method of blasting in coal mines termed "shooting off the solid."

A hole is bored or drilled in the face at or near the middle of the seam, at such a slant as to make a small angle with the face. If an imaginary line (*AB* in Fig. 4) drawn from the back of the drill hole at right angles to the hole passes out of the open face, and if that distance is not too great, the hole is rated as "safe" by those who use the method. If, however, the hole extends beyond *A* to *X* (Fig. 4), the extended part is said to be "dead" and the hole is considered "unsafe." A hole is also considered "unsafe" if the angle *ACB* is greater than 35°. In the softer coals and where the joints or cleavage planes (cleat) are favorable a greater angle is used, but no drill hole, even under such favorable conditions, is bored at an angle greater than 45°.

In shooting off the solid only one face of the coal to be thrown off is exposed. It must be torn off along the line *AB* and *AC* and in addition must be forced out along the bedding planes at top and bottom. Where such bedding planes are smooth this is not difficult, but generally they are irregular, and a strong shearing force must be exerted parallel to the bedding planes, both at the top and bottom. This method to be effective requires a slow-acting explosive, and black blasting powder has been much used in the work.

A second hole and even a third one are sometimes drilled and charged before the first one is fired, and these are called "dependent" shots. The fuses are sometimes made of different lengths and lighted at the same time, with the expectation that the shots will go off in the proper order. Such practice is now generally held to be very wrong even in "solid shooting" districts. The second and third holes should not be drilled until after the first shot has been made, so that the location of each shot can be properly judged.

The size or weight of the charge in shooting off the solid varies much in different coals. In fact it is extremely difficult, even in the same coal, to judge the amount correctly

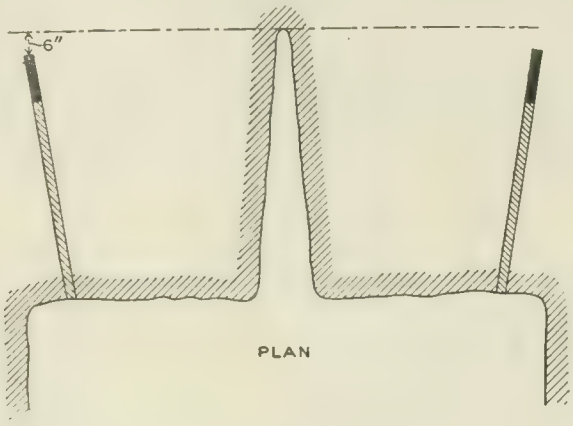

Fig. 5—Shearing.

each time. If undercharged, the hole is likely to "blow out"; hence it follows that holes are almost invariably overcharged, and in some districts all sense of right proportion has been lost by the miners.

Aside from the dangers in the use of black powder, the uncertainties in proportioning the charge to the work are such that the method of shooting off the solid can not be approved as either precise or safe. Many of the great mine disasters of this country have undoubtedly started from misjudged or overcharged shots off the solid.

The other method of bringing down the coal, in which the explosive is assisted by undercutting or shearing beforehand and which was early used in this country, is now being

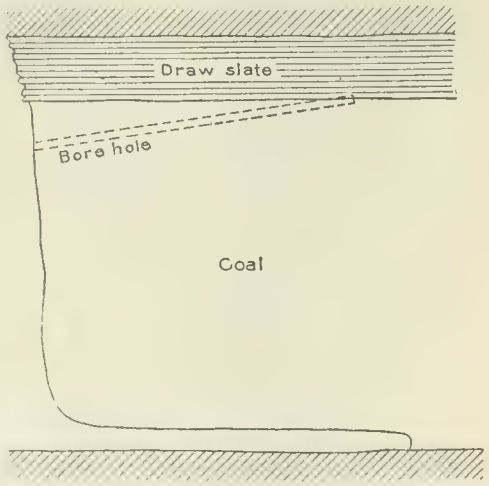

Fig. 6—Bore Hole for Permissible Explosives.

readopted in most parts of the country. The object of undercutting or shearing is to expose two faces of the mass of the coal to be brought down, and as coal generally tends to break along vertical planes, to permit the explosive to exert a wedging effect, rather than to shear or tear off the mass as it must in shooting off the solid.

There are two ways of applying this method—shearing and undercutting. Occasionally where the coal is hard to shoot down, both shearing and undercutting are done so that a less amount of explosive is needed; in fact, in some places none is required, as the coal can be wedged down.

Where the cutting is by hand and the top

and bottom part "freely," shearing is the easier, and is usually employed in entry or narrow work. In some cases the shear or vertical cut is made on but one rib, but generally it is made in the center of the narrow face and the shot is so placed as to throw the coal toward the shear.

Where the coal is all alike in character and parts equally well at top and bottom the hole is started at or near the middle of the seam and drilled nearly parallel with the shearing, slanting a little upward to cross the bedding planes, and also to clear itself of dust as it is being drilled. The hole should never go

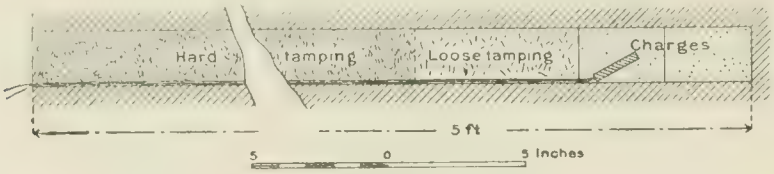

Fig. 7—Bore Hole Ready for Firing.

deeper than the cutting, and it is better for it not to go as deep by at least 6 inches as the cutting. In Fig. 5 the back of the bore hole is shown as reaching the projected line of the rib, but in softer coals the backs of the bore holes are usually at least 6 inches from the projected line of the rib.

With permissible explosives the mouth and back of the drill hole should be nearer the roof and the hole should slant upward in order that the back of the drill hole may reach the top bedding plane (Fig. 6). The break will then be clean and a wedging action will be exerted along the top bedding plane.

In the use of permissible explosives, special care should be taken that each bore hole has the same width throughout and is wide enough to permit the cartridges to pass through it without too hard ramming. Too small a hole may cause the cartridge to stick, and nitroglycerine explosives or even black powder may be exploded by the friction of the tamping bar against the sides of the hole. Daily attention should be given to the drills that are used in drilling the bore holes, and the points of the bits when being sharpened should be made to a standard size.

In blasting, any explosive gives the greatest disruptive effect when the charge most completely fills the bore hole from side to side. If the explosives are supplied in cartridge form this condition can often be obtained in the bore hole by splitting the wrapper, gently pushing a cartridge down into place in the bore hole with a tamping stick, gently squeezing it so that it spreads out to fill the entire width of the hole, and repeating this with each cartridge until the charge has all been put in. Finally the detonator is placed in the last cartridge put in, and this cartridge is known as the primer. The primer is gently pushed down into place in firm contact with the remainder of the charge, and the hole is tamped (Fig. 9).

If the same weights of different explosives are of equal strength, the one that takes up least space—that is, the densest—will have the greatest effect in breaking coal or rock. Of two cartridges of equal size containing different explosives the heavier cartridge is said to have the greater density.

With certain explosives, which are somewhat largely used, the cartridge case may be split and the charge rammed firmly into place. This is not the universal practice and should not be done with all the ammonium-nitrate class of explosives nor with some of the nitro-substitution explosives, for if they are tightly rammed in the bore hole, it is difficult or even almost impossible to explode them.

After the priming charge with its fuse and detonator or its electric detonator has been inserted in the bore hole, the hole should be tamped with clay or with other material that can not burn. It should never be tamped with coal dust (either wet or dry) or with machine cuttings, known as "bug dust." The tamping should be done by means of a wooden tamping stick. The pressure in tamping should be very gentle on the first tamping material put in, particularly if detonators are used in the primers, and great care should be taken at this time not to disturb the position of the detonator in the primer. Special care should be taken not to draw the detonator out from the primer or the fuse out from the detonator. When fuse is used, care should also be taken not to rub the surface off of it.

After the first 6 inches of the tamping material has been pressed down, greater force may be used in ramming the rest, because the firmer the tamping is the better is the work of the explosive and the less is the chance of a blown-out shot. The tamping should be continued quite up to the mouth of the bore hole. If fuse has been used, the upper side of it near the end may now be cut into on a slant, with a sharp knife, and the outer part bent way so as to form a notch in which the powder from the core gathers and to which the igniter is applied. This cutting prevents the loss of powder from the fuse and makes it easier to light.

The shattering effect of high explosives may be lessened in loading simply by pushing the cartridges into place without splitting or afterward squeezing them, so that an air space will be left about the cartridges in the bore hole, and then proceeding with the priming and tamping. This air space notably lessens the shattering effect of the explosive (Fig. 8).

Where it is desired to use black blasting powder, electric black powder igniters, sometimes called electric safety fuses or squibs, are recommended for setting off shots. They are made in a general way like electric detonators, but gun powder or other slow-burning composition is used in them instead of detonating composition. They are much safer for use in coal mines than ordinary squibs or fuse, both because they do not throw fire into the mine air and because they permit better tamping of the bore holes. It sometimes happens that it is desired to fire a number of charges at the same instant. This is readily done with electric detonators by coupling them up in series from hole to hole and firing by one discharge from the machine.

Premature explosions, misfires, and hang fires are most likely to happen when squibs and fuses are used to set off charges, owing to defects that may be in them from the first, or may be caused in the handling, carrying, or loading of them. Miners are especially warned in case of a hang fire to avoid returning to the breast until half an hour has passed. Hang fires rarely happen with electric detonators, but it is possible that they may happen more often with delay-action detonators.

Incomplete explosions may result from several causes. They may be due to failure to push in all the cartridges of a charge till they touch one another, thus leaving an air space between them, or else a mass of coal dust or dirt, which breaks the path of the detonation from cartridge to cartridge. They may be due to the pulling out, even but a little way, of the detonator from the primer or of the fuse from the detonator. In the use of nitrate of ammonia or nitro-substitution powders, incomplete explosions may be due to too tight packing and compressing in the bore hole. In any case, a partial explosion is a marked source of danger, first, because it may have the effects of an underloaded charge; second because the unexploded part of the charge may burn and throw out flame and sparks into the mine, and also give out poisonous gases and fumes; third, because the unexploded part of the charge, if it is not burned up, may be brought down with the coal and give rise to an accident in the breaker, or, if it passes the breaker, to an accident in the transportation or the use of the coal. Whenever there is a partial explosion, if coal has been brought down, careful search should be made in the coal for the remainder of the charge.

In case of a misfire no attempt should be made to draw the charge, but a new bore hole should be placed at least 2 feet away from the first one and fired, and after the coal has been brought down it should be carefully looked over to find any unexploded material that may have come from the hole that misfired. When a hole charged with black blasting powder has misfired the tamping and charge may be withdrawn, drenching them with water while withdrawing them. After the hole has been dried out it may be reloaded.

An electric igniter or an electric detonator should be so loaded into a bore hole that while it is in perfect contact with the charge the legs of it reach at least 6 inches out of the completely tamped hole. Both legs should be bared of their insulation for about 2 inches from their ends, and the wires scraped bright so that a good electrical contact can be made with them. Each leg is then firmly connected with one of the leading wires by about five turns. It is bad practice to have the two splices directly opposite each other, because when the leading wires are pulled the splices may touch one another and thus make a short circuit, which will prevent the electric igniter or electric detonator from being exploded. A better plan is to wrap the bare wire splices with tape made for the purpose, which will completely insulate them.

After the legs are spliced to the leading wires (and only after), the wires are connected to the firing machine from which the electric current is to be obtained. This last connection should never be made until all the men are at a safe distance from the place where the blast is to be fired. The rule should be made and never broken that when bore holes are charged the connecting up shall move from the bore hole back to the firing machine. The work in the face should be so organized that it can never be possible for the leading wires to be coupled up to the firing machine while any one is about the place where the holes are being charged and where the blast is to be fired. In heavy blasts in development work, two or more electric detonators may be used to good advantage in the same bore hole. For this purpose they are connected up in series, which means, for two detonators, that a leg of each is bared and the two legs twisted together and wrapped with insulating tape, and that then the two free legs are attached to the leading wires just as where but a single detonator is used. In coal mining the charge used should never be so large as to require the use of more than one detonator in the same hole.

When it is desired to fire two or more holes at the same time the detonators for these holes should also be connected up in series, and to bridge the space between the holes a cheap insulated wire, known as connecting

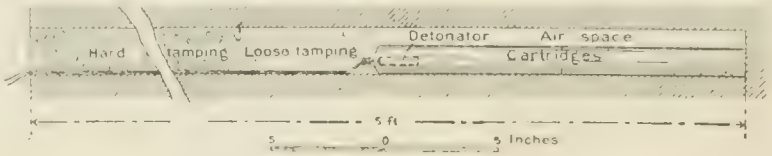

Fig. 8—Loaded Bore Hole Showing Air Space About the Charge.

wire, which is not as heavy as the leading wires, may be used. In coupling up a series of holes for this purpose, one leg of a detonator is connected to one leg of the detonator in the next hole, and so on to the last hole. There is then left one free leg in the first hole and one free leg in the last hole, and these are spliced to the leading wires. The usual precautions should be taken to wrap all the splices with insulating tape, so as to completely insulate them, and thereby insure a good circuit through which the current may pass. It should be borne in mind that the greater the number of holes to be fired in a single blast the greater is the necessity for making sure that the circuit is complete throughout, because if there is a break or a short circuit at any point, the blast will probably fail to fire. The delay, expense, and danger caused by such a failure can be prevented by giving careful attention in the first place to the charging and the wiring.

The electric current for use in firing electric igniters or electric detonators may be obtained either from primary batteries, such as dry cell batteries, or from secondary batteries, such as storage batteries, or from electric lighting circuits, or from generators known as electric firing machines.

Firing charges of explosives by means of ordinary dry cells has been prohibited in foreign countries, because premature firing of detonators, and sometimes of the charge, has been caused by the wires coming into contact with the poles of the batteries. Safety contact dry cell batteries have lately been introduced abroad and in this country. These are made with a spring key contact, or with two safety spring contact buttons, which are the poles of the battery. The two leading wires are laid on the buttons, which are at the same time pushed downward. When the pressure of the thumbs is released the contact is broken. If the wires of a detonator accidentally come into contact with the poles of the battery, the current can not be discharged unless both poles are pushed downward.

Dry cells, small batteries, and some firing machines can be carried about by the miner who is to act as shot firer, and this is an advantage that insures him against premature firing by any other person. Such small devices can at best be used with only a few shots in one circuit. The number of shots to be fired and the length of leading wires and other conductors through which the firing is to be done must be known beforehand, so that a battery of sufficient capacity can be selected. Batteries often fail to fire blasts because they can not send such a current as will fire through the great length of leading wires, connectors, and detonator legs that is used for the blast. A simple way to test the strength of the batteries is to pass the current through a small electric lamp of known capacity and note the brightness of the light given by the lamp. Another way is to pass the current from the battery through a testing circuit whose resistance is equal to that of the circuit of a blast and which has in it one electric detonator. If the battery fires this detonator (which should be put in a safe place) it is strong enough and in good condition.

When the electric current for firing is obtained from an electric lighting circuit the connections are usually made in parallel; that is, one leg of every detonator is connected to one of the leading wires and all the other legs to the other leading wire. Care must be taken, by the use of insulating tape, that there shall be no short circuiting in these connections. This method has the advantage that if there is a defective electric igniter or electric detonator in the circuit its failure will not prevent the rest of the blast from being fired; but, on the other hand, this method is objectionable because at any time after the explosion of the good igniters or detonators the unexploded charge with the defective igniter or detonator may be blown out and scattered in the coal, or it may even be set afire or perhaps exploded in the air of the mine by shock or friction. Furthermore, in this and other methods of electric firing an accidental premature blast may possibly be caused by leakage from the electric main to the earth and through the leading wires or connections, which may have become bared by rough handling or may not have been properly covered by the insulating tape. Premature explosions have been known to occur that were caused by leakage due to defective insulation.

Firing machines, sometimes called blasting machines, generate the electric current to be used in firing by mechanical means. A variety of such machines has been invented, but the two best known classes are the dynamo-electric machines and the magnetos. The dynamo-electric machines are made like ordinary dynamos used for generating electric currents, differing only in that they are worked by hand. They contain a coil-wound armature which is rotated between the poles of an electromagnet. This armature can be made to revolve by means of a crank or a vertical ratchet geared direct to the spindle of the armature. The machines with ratchet bars are made so as to take up the current during a stroke, until just as the stroke is ended the entire current that has gathered is discharged through the leading wires.

These machines are built in different sizes and are rated according to the number of electric detonators they can fire. Thus a "50-hole" machine will, when properly worked, fire 50 detonators at one discharge. The machines usually built for use in coal mines are rated as "4-hole" machines; and such a machine can be conveniently carried about by the miner or shot firer.

The magneto machines consist mainly of an armature revolving between the poles of a set of permanent magnets. They look much like the dynamo-electric machines that are worked by cranks, and they are used in much the same way. These magneto machines are used to a considerable extent in foreign countries, but the "push down" dynamo-electric machine is the one most commonly used in the United States.

The leading wires that carry the current from the blasting machine to the blast hole are of insulated copper wire, copper being used because it is one of the best conductors of electricity known and has the further advantage of being but little corroded in damp mines. These leading wires or firing lines are insulated with a braided covering, which is better if made water proof. In some instances the two wires are twisted together and wrapped with an additional coating of braid, making them into one cable, which has the advantage of being more easily handled than two separate leading wires, and has also

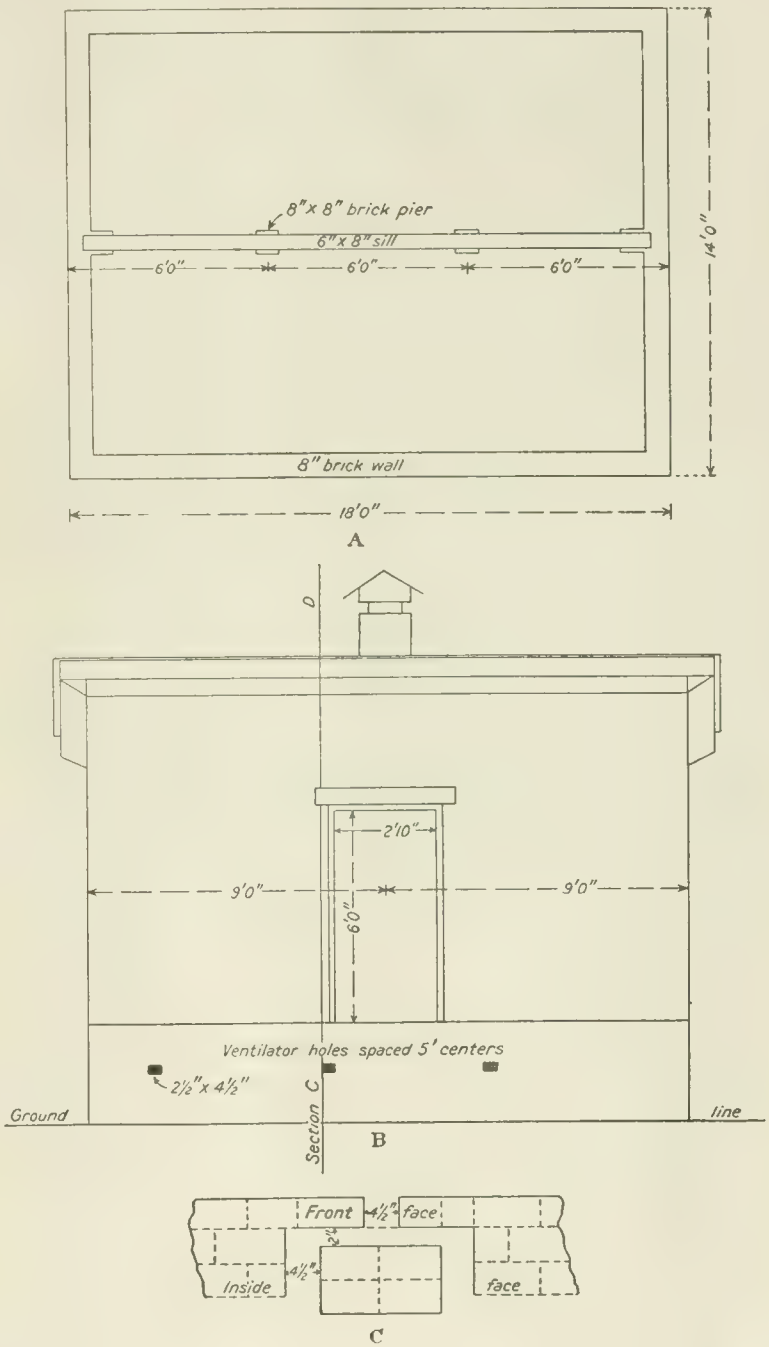

Fig. 9—Foundation Plan, Front Elevation and Plan of Ventilation of Brick Magazine.

the advantage of the added protection given by the additional braiding.

After the blast has been fired, the ends of the leading wires should be immediately disconnected from the posts of the firing machine, and the lines should be examined for their whole length in order to see that the insulation has not been broken by coal or rock thrown against it, nor been stripped by the force of the blast. Where such defects or injuries are found, they should at once be repaired with insulating tape, and then the leading wires should be placed where they are not liable to injury until they are again needed.

For testing the line after it is connected up and before the firing, in order to show that the circuit is complete and that there is no leakage in the wires, a special galvanometer may be used, together with a battery such as many of the manufacturers of explosives now sell. This galvanometer, like others, bears upon its face a needle, which is turned or deflected if an electric current is present. By noting whether this needle is deflected or not one can tell whether the circuit is closed or open, and the extent of the deflection shows just how little resistance there is in the circuit. To use the galvanometer, the wires leading from it are connected to the two binding posts of the firing machine, to which the wires leading to the charge have already been connected. The deflection may then be noted. The current generated by the very weak battery cell attached to the galvanometer should not be strong enough to fire the electric detonators used in the bore holes, but is enough to deflect the galvanometer needle. This testing galvanometer, with its attached battery, should never be applied directly to the fuse to be blasted, even when it is being used to find out, when the test has shown no current, which of the electric igniters or electric detonators are defective. The tests for the separate detonators or igniters should always be made through leading wires long enough to let the person making the test stand where he would be perfectly safe if the blast should be fired; and on no account should this testing of the igniters or detonators be made while any person is so near that he may be in danger from the blast.

In the sinking of shafts or in the removal of rock or dirt by means of explosives, the methods to be followed in loading, tamping, and firing the charges of explosives are similar to those described for use in blasting coal.

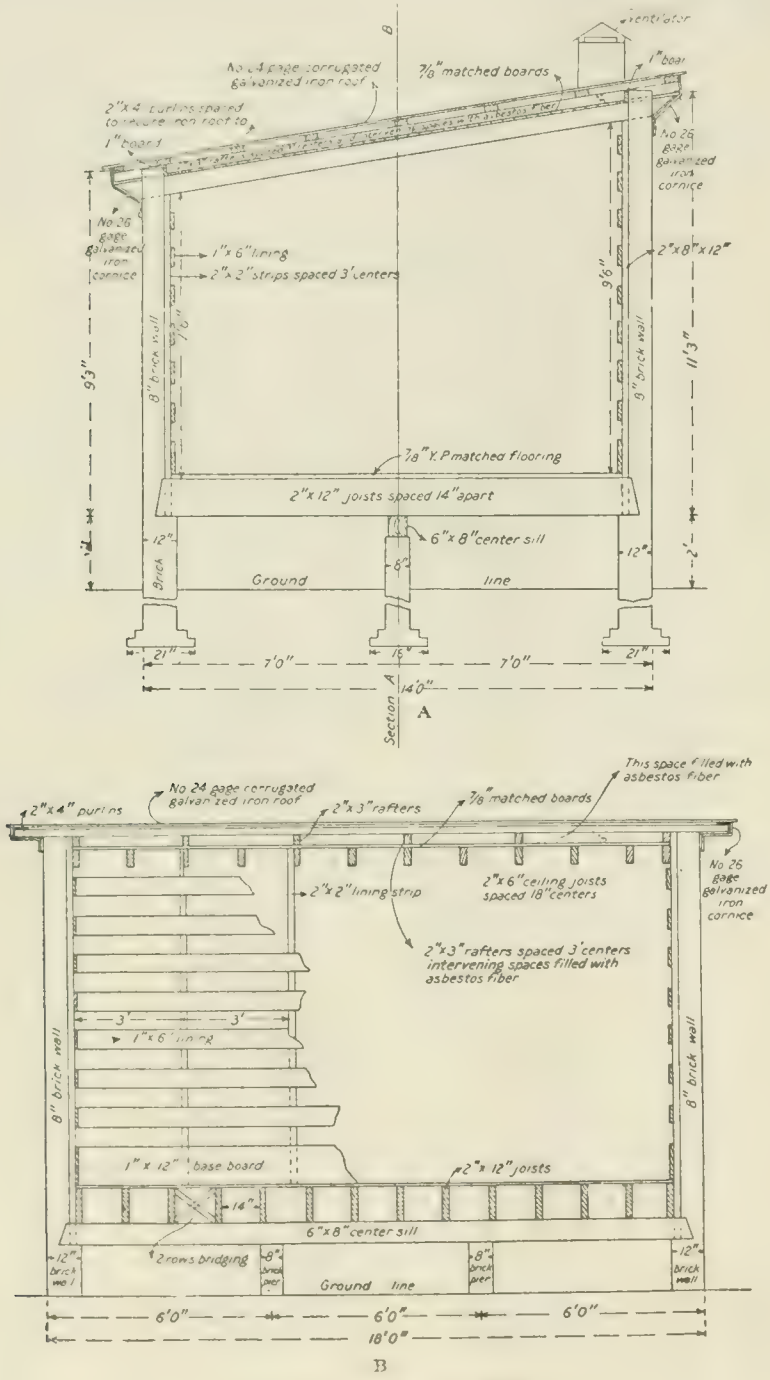

Fig. 10—Sections of Magazine.

In this as in other work electric firing will be found to be the safest means of shot firing, and in the long run the cheapest.

It is not uncommon to hear the statement that high explosives, because they are quicker in action than low explosives, need not be tamped. This is a serious error. The fallacy of it has been repeatedly proved in the tests of many different explosives made at the Pittsburg testing station. It has there been clearly shown that the highest pressure an explosive can give, and therefore the greatest amount of energy it can set free, will be developed only when the explosive is confined in the smallest possible space. Hence after the charges have been loaded into the bore holes they should be tamped with such materials (the best being damp clay) as confine the charges most closely, and this material should be rammed in firmly, with the precautions already set forth, quite to the mouth of the bore hole.

Electric or other detonators containing not less than 1 gram of the fulminating composition should be used in firing the charges. For use with high explosives in rock blasting, detonators of that strength are also best. Under no circumstances should an electric or other detonator be used of less strength than No. 5, containing 0.8 gram of the fulminating composition. The greater efficiency and certainty of the stronger detonator more than make up for its slightly greater cost.

In the sinking of shafts, after the soil has been removed and the overlying layers of shale and rock are uncovered, it becomes necessary to use explosives; and because in such a place the ventilation is always poor and the miner must wait for the fumes and smoke to clear away after each blast before he can safely return to his work, time can usually be saved by firing shots in groups instead of singly. Dynamite, or, when the shaft is wet, gelatine dynamite, may be used for these shots, which should always be fired after the men are out of the shaft. The most economical and safest way of firing a number of shots at one time is by means of the electric current, with electric detonators. The older method of firing by fuse is dangerous and wasteful. Where fuse is used, there is always danger that a seeming misfire may prove to be a hang fire—that is, the smoldering fuse may cause the charge to explode unexpectedly; also, if by any chance there is any irregularity in the burning of the fuse, the miner can not properly judge the time necessary to get out of the shaft and out of danger after having lighted the fuse.

In shafts that run through rock, as most shafts do, there is no objection to the shattering effect of firing several shots at the same instant, and this method is recommended; but when it happens that in shaft sinking the shattering effect would be harmful, and successive shots are therefore used, it is still advised that they be fired by electricity. For such shots, however, a less violent explosive may be employed, and the delay-action electric detonator may be used to good advantage.

The following explosives may be recommended, in a general way, for use when the size and condition of the material resulting from the blast is not important, for example, in the sinking of shafts or the driving of entries through rock:

For use where the texture of the material is very tough and hard, as in tough granite, hard boulders, and the like, 60 per cent straight nitroglycerine dynamite is recommended. Where the material is of moderate toughness and somewhat brittle, 50 per cent straight nitroglycerine dynamite is recommended. In material such as limestone and sandstone, 40 per cent straight nitroglycerine dynamite is recommended. In hard earth or compact sand, a 30 to 20 per cent straight nitroglycerine dynamite is recommended. In material such as a soft crumbly or seamy rock that requires a stronger explosive than black blasting powder, but a slower explosive than dynamite, a granulated powder containing 5 per cent of nitroglycerine is recommended. This should always be fired with a priming stick of dynamite. With this exception, dif-

ferent kinds of explosives should never be used in the same bore hole.

For very soft work in cuts and fills, or for quarry work when dimension stone is sought, black blasting powder is recommended. In grading work the blast hole may be bottomed out with dynamite before charging with granulated powder or with black blasting powder, but before it is charged care should be taken to see that the dynamite charge has not left any fire in the hole. In plastering or adobe work on boulders and spawls, or in block holing, a strong dynamite should be used. Block holing is the more effective and economical method for use with boulders.

If the straight nitroglycerine dynamites, as recommended above, are found to be too quick or too violent for use, and the results obtained are not as desired under the given circumstances, ammonia dynamites, which give a more heaving and rending action, are recommended. They are made in several grades and are rated as of a certain percentage of strength, but this rating is not always made in a scientific way. The following composition is an example of that which is generally offered in this country as a 40 per cent strength ammonia dynamite:

	Per cent.
Nitroglycerine	[illegible]
Ammonium nitrate	[illegible]
Dope	[illegible]

This composition does not contain so large a percentage of nitroglycerine as the straight 40 per cent dynamite, and as tested at the Pittsburg testing station it is not found to produce the same results as the latter. Nevertheless the ammonia dynamites are often found to be more economical and more efficient for certain classes of work than the straight dynamites of the same commercial rating. The ammonia dynamites are less readily set off and are safer to handle, transport, and store than the straight dynamites are, but they all require stronger detonators than the straight dynamites to insure a complete and rapid detonation. They have the disadvantage, compared with the straight dynamites, of taking up moisture very readily, and great care should be used in storing them or in using them in wet holes.

For use in very wet blasting and in places where there is poor ventilation the gelatine dynamites are recommended. Water has but little effect on them, and on complete explosion they yield only a small quantity of fumes and bad gases. Like ammonia dynamites, gelatine dynamites are less sensitive than straight nitroglycerine dynamites, and they therefore require stronger detonators to cause their complete explosion. They become less sensitive during long storage and they have been known after long storage in tropical countries to become so insensitive that they could not be detonated by means of the devices ordinarily used in firing them. Gelatine dynamite is likely to decompose during storage in very hot places.

Like the ammonia dynamites, the gelatine dynamites are sold in several grades and are given a somewhat unscientific rating in commerce. The grade known as 40 per cent strength gelatine dynamite, as generally offered in this country, has the following composition:

	Per cent.
Nitroglycerine	32
Soluble nitrocellulose	1
Dope	67

As tested at the Pittsburg testing station, gelatine dynamites have not been found to be equivalent in every respect to straight nitroglycerine dynamites of the same commercial rating, and as regards economy they should seldom be used as equivalent; but they are superior for some uses, as mentioned above.

There is no standard type of storage magazine in use in this country, and the laws and regulations in foreign countries applicable to the construction of magazines differ materially. In Austria, for example, they are required to be of light construction, while in England they must have walls at least 18 inches thick. In Chicago they are made of wooden studding frame work covered on both sides with wood and the space filled with dry sand. This applies as well to the roof as to the sides. The exterior of the building must be covered with No. 26 or No. 28 sheet iron. Proper ventilation must be supplied in the roof. No lights permitted.

Explosives should be protected as far as practicable during storage against heat, moisture, fire, lightning, projectiles, and theft. The buildings should therefore be weatherproof, covered by fire-proof and bullet-proof material, well ventilated, in secluded locations, and not beside grass or underbrush subject to fire risk. Lightning protection is best placed on a line of supports encircling the building and 20 to 30 feet distant from it. Figures 9 and 10 shows plans of an approved type of magazine.

It is difficult to state definitely safe distances to separate magazines from dwellings, highways, railroads, etc. The proper distance must vary evidently with the amount of explosives stored and the degree of natural protection afforded by the slope of the ground and of artificial protection, such as barricades or mounds of earth.

The distances prescribed by the English law have been adopted by the state of Massachusetts. They are materially greater for large quantities of explosives than those prescribed in other countries. For example, the distances from a railway or public highway prescribed for a magazine containing explosives without natural or artificial protection are: For 1,000 pounds—England, 630 feet; Prussia, 984; Austria, 984; Italy, 244; for 10,000 pounds—England, 795 feet; Prussia, 1,968; Austria, 1,640; Italy, 328; for 80,000 pounds—England, 2,160 feet; Prussia, 1,968; Austria, 984; Italy, 574.

These distances may be materially reduced, in some places to one-half or even to one-quarter, where there is good natural or artificial protection.

Magazines should be kept clean and in thorough repair. Grounds around them should be kept clear of leaves, grass, or other materials that might feed a fire. These words should be conspicuously posted on them: "Explosives dangerous. No shooting allowed." The floors must be swept regularly and kept clean. The sweepings should be thrown in water or taken to a safe distance and destroyed.

In case floors become stained with nitroglycerine, cover the stains with dry sawdust, sweep up, and remove the sawdust. Then scrub the stains thoroughly with a hard brush and a solution of one-half pound of sulphide of sodium or sulphide of potassium in one-half gallon of wood alcohol.

Do not allow in the magazine any tools other than a wooden mallet and wooden wedge, or a phosphor-bronze chisel, and a screw driver to be used only for removing screws.

Do not open dynamite boxes with a nail puller or powder cans with pickaxes.

Remove all explosives before repairing a magazine.

Do not store detonators with explosives, especially high explosives.

Do not open packages of explosives in a magazine.

Issue first the oldest explosives on hand.

Do not store dynamite boxes on end, as this increases the danger of nitroglycerine leaking from the cartridges.

Pocket Edition of Geologic Folios.—The U. S. Geological Survey has just adopted an octavo field or "pocket" edition for its geologic folio publications. The results of the detailed geologic surveys necessary to the preparation of the geologic map of the United States have heretofore been published by the Survey in folio form, 168 such folios having been already printed. Each folio contains the topographic base map of the quadrangle under consideration and maps showing the areal and structural geology, while in some folios are maps showing the economic geology and in others the underground water resources of the region. The map sheets are of the standard size—about 18 by 21 ins.—and are accompanied by brief descriptive texts printed on sheets of corresponding size, making the folios extremely cumbersome for field use.

While the folio form has given general satisfaction for office and library use, it has been recognized for some time that a more convenient and if possible a "pocket" edition would add greatly to the value of the publication for field work. The Survey therefore sent a circular request to the principal geologists, civil and mining engineers, teachers and librarians requesting their opinion as to the desirability of a change in form and inviting suggestions. The consensus of opinion was that there ought to be two styles, some copies to be in folio form as heretofore and some in octavo. Many librarians and most instructors prefer the unfolded maps, while on the other hand most mining men desire a pocket edition with loose folded maps for field work, but wish also the unfolded map for office and wall use.

It has therefore been determined to continue the folio form of this publication and also to print a field edition of these folios in octavo size—about 6 by 9 ins.—in which the maps are folded and inclosed in a pocket.

Although the folios of the geologic atlas are prepared primarily for educational and technical purposes, they have also been of interest to many non-technical people who have desired to obtain some knowledge of the geology of the areas in which they live, but the large size of the folios has served to keep them out of the book case. The folios in the new form can easily be preserved on ordinary shelves with other books.

Five folios in this form have been printed by the Survey and are now ready for distribution—namely: the Belle Fourche (South Dakota), the Aberdeen-Redfield (South Dakota), the El Paso (Texas), the Trenton (New Jersey), and the Jamestown Tower (North Dakota), numbered respectively 164, 165, 166, 167 and 168. They are bound in substantial covers provided with pockets that hold securely the accompanying maps. The maps are printed on a special paper that will bear refolding and handling and the books will slip into a good sized coat pocket.

Another slight departure in connection with the publication of the geologic atlas, beginning with the above four numbers, is the printing of separate maps (unfolded) showing the areal geology of the quadrangle.

Care of Gasoline Engines in Freezing Weather by Use of Anti-Freezing Mixtures.—The following are rules for avoiding freezing of water in the cylinders, pipes, radiators, etc., of the cooling system of water-cooled automobile engines and stationary explosive engines. As soon as freezing weather approaches or when the temperature drops as low as 40 degrees F. all water should be drained from the radiator, cylinders and pump, says Gas Review, and the radiator filled with one of the solutions given.

1. A mixture of glycerine and water in the proportion, by weight of 25 per cent of the former and 70 per cent of the latter, to which is added 2 per cent of sodium carbonate.

2. Chemically pure calcium chloride dissolved in hot water in the proportion of 4 pounds to one gallon of water.

3. Sodium chloride (common salt) or magnesium chloride dissolved in water in the proportion of 1½ to 2 pounds to the gallon.

4. Wood alcohol in the proportion of 20 per cent alcohol to 80 per cent of water. This solution has the advantage of being sufficient for average winter weather, and it has no ill effect of any kind on metals nor does it leave any sediment.

Should the thermometer reach as low as 15 degrees F., a solution of about 25 per cent alcohol and 75 per cent water should be used. For temperatures below zero, use 30 per cent alcohol and 70 per cent water.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

The Possibilities of Portland Cement as a Road Material.*

BY LOGAN WALLER PAGE.†

Lime-cement concrete is the oldest road material of which we have any record. The Roman roads, which were of this type of construction, are the only ones which have endured for any great length of time. The Appian Way, which is undoubtedly the best type of Roman road, was begun by Appius Claudius 312 years B. C. and parts of it are in a remarkably good state of preservation to-day. We know perfectly well that any of our modern Portland cements are far superior in strength and durability to the lime mortar used by the Romans, and yet I have never seen a road built of Portland cement concrete that I considered altogether a success. There are two characteristics of Portland cement concrete which, in my opinion, bring about the failure of roads constructed of it. They are, first, the tendency of concrete, where exposed as in a road surface, to develop shrinkage cracks. These cracks are generally parallel to the road and increase in size as time goes on. The second characteristic which brings about failure is the ease which concrete spalls along the margins of cracks. I have never seen a concrete road fail through what I thought was expansion, but it is the general practice to place expansion joints at right angles to the line of concrete roads at frequent intervals, and the road suffers much from spalling at these joints.

It is perfectly apparent to any one who has made a study of the subject, that there could be no better form of road construction, at so low a cost, to meet only automobile traffic conditions than a cement macadam road. The most durable types of rock could be used as an aggregate, which would give maximum life to the road, and it would be practically dustless. So apparent is this, that in the endeavor to use Portland cement in road construction much ingenuity and refinement has been resorted to, but with the exception of a few isolated cases, real success has not been attained.

It might be appropriately asked, Why have the Roman roads stood varying conditions for so many centuries? I believe that a consideration of this point might be helpful in meeting our present conditions.

In the construction of Roman roads of the best type, a trench about 3 ft. deep was excavated the entire width of the road, and wherever poor material was present it was removed and replaced by suitable material, and the whole subgrade was thoroughly compacted by ramming. Generally four distinct layers were placed in these roads. The bottom course, or *statumen,* was composed of two courses of stones placed in lime mortar. On top of this was placed the *rudus,* or rubble, which consisted either of broken stone, or when available, broken bricks, potsherds, etc. When the latter composed the aggregate, more lime was used in the proportion of 2 to 5. This course was very thoroughly rammed, and was usually about 9 ins. thick. The third course, or *nucleus,* was composed of old building material such as brickbats, broken tiles, etc., mixed with lime in proportion of 1 to 3. This course was not rammed and the lime was mixed hot. Above this course came the top or wearing surface called the *summam crustam,* which was made of blocks of flat stone set in mortar and fitted together with great refinement. It can be seen that the third layer, or *nucleus,* was much soften than any of the others, and was placed purposely below the top layer which was designed to take the wear of traffic.

This type of road was undoubtedly the result of much experience. There are four distinct features which I consider worthy of the fullest consideration. First, an absolutely secure foundation was always obtained; second, a resilient or cushion layer was placed just beneath the wearing surface; third, the four layers composing the road had different coefficients of expansion which would probably preclude the development of definite lines of stress brought about by contraction; fourth, the exposed or wearing surface was composed of a material which would not only withstand the wear of traffic, but atmospheric conditions as well.

We frequently hear the statement that the Roman method of road building is a lost art, and that we cannot build roads to-day of a similar character. This is altogether a mistake. We could not only build similar roads, but roads which under the same conditions would be more durable. A road of the Roman type under modern city traffic conditions would last only a few years, and would probably cost $250,000 a mile to build. The traffic they were subjected to consisted of light vehicles and unshod horses, and the fact that unshod horses were used leads one to believe that an earth cushion was probably maintained on the surface of these roads as otherwise a horse would go lame after 50 or 60 miles of travel. The portions of Roman roads that we find intact to-day are those which have either been subjected to very light traffic or have been completely covered up with earth for long periods of time. In most cases we find only portions of the foundations.

The nearest approach we have to the Roman road to-day is the best type of paving brick, laid on a concrete foundation with a 2-in. sand cushion, and this type of road suits automobile traffic admirably, but is very hard on the feet of horses. As far as I have observed the concrete foundations both for brick pavements and asphalt streets rarely crack except from faulty foundations. The contraction cracks, therefore, I believe are due to no fault in the cement, but to the great range of temperature to which the road surface is subjected, and the fact that it is generally laid during the warmest season of the year, when expansion is greatest. This view is further upheld when one considers that concrete floors and pavements laid on earth foundations inside of buildings rarely crack.

Whether this view of the matter is correct or not, we know that concrete roads at present are not satisfactory, and our next consideration is whether they can be made so. Concrete has been almost universally adopted as a foundation for almost all types of heavy traffic pavements. It gives perfect satisfaction when protected from direct exposure, and whether methods of construction, or treatment, can be devised by which concrete can be used as a wearing surface for roads is a matter for investigation.

It is my belief that in most concrete roads the concrete is too uniformly mixed and too homogeneous in composition. This may account, in a measure, for the development of shrinkage cracks, where the surface is exposed to a great range of temperature. Concrete is also too unyielding to the blows of traffic and too brittle, both of which characteristics facilitate spalling. It seems to me that a pavement can be made which, to some extent, will obviate these undesirable characteristics, and I would suggest the following general specifications:

About 6 ins. of number one broken stone mixed with the screenings below ½-in., thoroughly rolled with a steam roller as a foundation course. On top of this, spread a uniform layer about 1 in. in thickness of rather dry cement sand mortar. Over this course of mortar at once spread about 3 ins. of No. 2 stone, which should immediately be rolled with a steam roller until the cement sand mortar rises flush with the surface. Such a road as this, I believe, would have many advantages. It could be opened to traffic within a short time after completion; it would not be as rigid as an ordinarily mixed concrete road. I do not believe it would be as likely to crack as ordinary concrete, as the stones forming the aggregate would rest firmly upon each other, receiving the blows of traffic, and the cement mortar only acting as a binding matrix. Further than this, there would be a minimum amount of cement used, and no two horizontal sections of such a road would have the same coefficient of expansion. Rock of the very highest resistance to wear could be used without any consideration of its natural binding power, which is so important in the ordinary macadam road. Another most important feature of this type of construction would be the absence of dust on the surface, which is so much sought after by highway engineers at the present time It would also give an excellent surface, not too slippery nor too noisy. Most important of all, however, such a road would not cost more than 10 or 15 cts. per sq. yd. more than ordinary macadam, which extra amount is about the annual cost of spreading bituminous dust preventives.

I have mentioned this type of construction as a possible cheap method of using concrete in road building. Another way of approaching the problem is to treat Portland cement so that its brittleness will be reduced and its resilience increased. This I believe, would be of great advantage, even if in so doing the tensile strength was greatly lessened. It can be seen that a material like asphalt, which meets so successfully the wear of traffic, is of a semi-plastic nature, with very low tensile strength and no elastic limit. Alone, a slight blow will permanently deform it. Its adhesiveness to mineral matter, however, permits its being tempered by a mineral aggregate to the desired consistency. It is also known that the addition of Portland cement to asphalt surface mixtures is very desirable With these points in view, the Office of Public Roads has begun an investigation to ascertain the practicability of mixing semi-asphaltic base oils with Portland cement concrete, with the object of obtaining the desirable properties of both the cement and asphalt. Up to the present time, our results have been somewhat encouraging. We have succeeded in making mixtures of as high as 20 per cent of oil, and both the 7 and 28-day tests for toughness and tensile strength showed a regular increase. Briquettes with 5 per cent additions of oil broke in tension at 230 lbs. after 7 days in soak, and 296 lbs. after 28 days; with 10 per cent oil, 228 lbs.; with 15 per cent, 246 lbs.; and with 20 per cent, 203 lbs., all after 28 days. The results obtained under impact were practically parallel with those under tension. Increased proportions of oil retarded both the initial and final set in increasing amounts; the tensile strength and toughness were also reduced, but not in like proportions. It has been shown that concrete immersed or mixed with animal and vegetable oils disintegrates and, of course, this may be the case with petroleum. It is my intention to continue this investigation until the several points under consideration have definitely been settled. I might mention further that parallel tests were made with tar and cement, but the results were practically all negative.

If it is found that cement can be mixed with asphaltic base oils, and increased toughness obtained, I believe that the value of cement as a road building material will be very much increased. The matter of mixing the oil is very simple, and can be conducted

*A paper read before the Association of American Portland Cement Manufacturers Dec. 15, 1909.

†Director U. S. Office of Public Roads.

in an ordinary concrete mixer. All that is necessary is that the cement be thoroughly wet before the oil is added. On account of the lime present the oil quickly emulsifies and is evenly distributed. Mr. Moyer has suggested that the addition of hydrated lime would permit of larger proportions of oil, which I believe will prove to be the case. I further believe that concrete mixed in this way will be impervious to water.

While a laboratory investigation of this nature is very interesting and instructive, yet no final results can be obtained until an actual service test is made, and it is my earnest hope that in the near future I may be able to make satisfactory arrangements for one or more cooperative service tests, as the appropriation for the Office of Public Roads cannot be used for the purchase of material and labor for road building.

Notes on Road and Street Work.

Effect of Automobile Traffic on Road Surfaces.—As the result of some tests on the effect of automobiles on road surfaces, conducted last fall by Mr. James Owen, Engineer of Essex County, New Jersey, the following conclusions were reached: automobile travel at low speeds is not detrimental to the macadam surface, the tires of the wheels acting merely compressively. The limit of this low speed is somewhere between 20 and 25 miles. At higher speeds stripping action begins and with the continual stripping, the loosening tendency is inevitable and dust raising follows. The stripping effect is reduced if a clay-packing surface is used, but the dust raised is still objectionable. A surface oil treatment practically eliminates dust and a continually good surface is maintained. The extra wear and shattering of a macadam road surface is due to a combination of self propelled and horse-drawn traffic. The tests from which the above deductions were drawn were conducted on a mile stretch of county road at Glen Ellen, N. J. The road as originally built was of the telford macadam type, the telford foundation being 8 ins. thick and the surface coat 3 ins. thick. For the past three or four years, during which time no attempt had been made to repair the road or prevent dust on it, the road had been used almost exclusively by high speed motor cars. As a result the surface coat of the road was reduced to about 2 ins., and the center of the road was completely bare of dust covering. The smaller stones in the surface had become loosened, but few of the larger ones appeared to have been displaced. In fact the road showed only slight abrasion. For the purpose of the test one portion of the road was left in its original condition, another portion was given a light coating of oil, and a third portion, about two months prior to the test, was covered with a surface coating of clay. Before the tests were started the conditions of the different test sections were carefully noted. The section having the surface coating of clay was found to be in far better condition than the untreated road for it showed only slight abrasions exposing small stones. The surface coated with oil was in an entirely satisfactory condition the only roughness being caused by projecting knobs of the bedded stone. For the tests automobiles, weighing from 2,000 lbs. to 3,800 lbs. were driven at speeds ranging from 10 miles to 60 miles an hour, in the center of the road and on the sides of the road. The effects of the various speeds on the different road surfaces were as follows:

BARE STONE SURFACE.

10 miles per hour: No trace in center, compression of dust at side.

20 miles per hour: Surface dust spread sideways, but no stripping.

30 miles per hour: Surface dust begins to strip.

40 miles per hour: Surface under tire swept bare.

45 miles per hour: Dust lifted, surface stripped, but no breaking.

55 miles per hour: Road stripped bare, but no breaking.

60 miles per hour: Road stripped bare, but no breaking.

OILED ROAD.

30 miles per hour: Heavy oiled dust raised 1 ft.

40 miles per hour: Same as for 30 miles per hour.

60 miles per hour: Strips dust.

High speed on the oiled road had no effect on the surface, other than loosening it or scattering the particles sideways.

ROAD SURFACED WITH CLAY.

15 miles per hour: Compression only.

20 miles per hour: Dust raised.

35 miles per hour: Heavy dust raised: no breaking.

44 miles per hour: Heavy dust raised; no breaking.

52 miles per hour: Heavy dust raised; no breaking.

There was no tendency for the clay packed surface to break up under high speed, but merely to raise dust and scatter it according to the wind.

Supplemented experiments were made by driving five heavy coal wagons over the road. The results, showed that with the hammering of the caulked shoes of the heavy horses, followed by the wide iron tired wheels, a tendency toward complete breaking up began. It was stated that large stones which were undisturbed by the automobiles were moved by the coal wagons and horses.

A Card for Recording Street Maintenance Work.—In our last issue we gave a system for recording and accounting for supplies and labor in the paving division of a street department. This system was given by Mr. Samuel Whinery, consulting engineer, New York city, in his report to the Finance Commission of Boston. Mr. Whinery also suggested the accompanying card for use in recording street maintenance work. Its details may of course be varied to suit special conditions.

Catch Basins in Sewer Systems.

I am opposed to the ordinary construction prevalent in the city of catch basins, which are simply a series of cess pools, waiting to be cleaned by rain storms. The refuse of the street goes into them. It dissolves and it remains there. It is not a septic tank because it does not get time to form a scum on top and create septic action, so it is nothing more or less than a cess pool on every corner of the street. Created for what? It may be excusable to have something of that kind in an extremely flat section of country where a large amount of sand is continuously finding its way to the street, and to allow that sand and that kind of material to get into the sewer would cause decomposition and ultimate destruction of the pipes of which the sewer is built. In a great majority of towns where they have good grades, such, for instance, as we have here and in Kansas City, there is no excuse for a basin.

Omaha is perhaps the only city of over one hundred thousand population which has had in successful operation for many years a system of untrapped connections from the roof to the sewer and from the sewer inlets at the street corner to the sewer, upon the broad theory that thorough aeration of the sewer through the constant unbroken air currents will give more satisfactory results from a sanitary standpoint.

Now around here in this city, if the weather permits, you can walk along our numerous inlets at every corner. You may find evaporation and vapor coming up because of high winds and extreme difference of temperature, but you will not experience any odors. But you can go to Kansas City and that is the universal complaint there, that there are strong odors at every street corner. They can be avoided provided they just stop these catch basins and convert them into inlets. In other words, slope the bottom of the catch basin towards the pipe connection leading to the sewer, so that when the sewer is free there is nothing left to decompose and give off odors. Where sewers are thoroughly ventilated from the man holes you will not find any offensive odor in going through them. I have walked through many miles of our sewers wearing a pair of rubber boots and could scarcely notice the odor because of the aeration, and if any foul matter stuck to the side of the sewer and decomposed to any extent, the enormous amount of aeration that took place so diluted the atmosphere of gases as to render it harmless and innocuous, with an odor hardly noticeable.—From an address of Andrew Rosewater, city engineer of Omaha, Neb., at the fourth annual convention of the American Society of Inspectors of Plumbing and Sanitary Engineers, February, 1909, a few weeks before his death.

Our water system was installed 22 years ago with two pumps, having a capacity of 1,250,000 gallons each per day. With a population of 7,500 we had 120 meters installed and the use of water was decreased to 1,125,000 gallons for each pump. In 1905, with a population of not less than 45,000, we had 3,200 meters in use and the system was operated with the same pumps delivering 1,250,000 gallons each. This is about 35 gallons per capital. The patrons are satisfied with the operation of the system, which we would have been compelled to enlarge several years ago only for the meters.—Report of Superintendent of Water Works of Sioux City, Ia.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Standards for Sewage Effluents.

Dr. John C. Thresh, the eminent authority on sewage disposal, read a paper with the above title at the annual meeting, Dec. 9, 1909, of the Association of Managers of Sewage Disposal Works (England) from which the following abstracts have been made.

Dr. Thresh stated that the manager is responsible for the proper treatment of the sewage in the works entrusted to his care and whether he is successfully treating the sewage or not can only be determined by the examination of the effluents produced. It is necessary therefore for the effluents to be examined at frequent intervals, and it is imperative that some standard should be fixed which he can reasonably be expected to attain. If this standard is one which can be ascertained approximately by the manager, so much the better, since where, as in the majority of cases, a chemist is not employed, the manager himself can determine whether his effluent is satisfactory, and can examine the effluents from different beds or different parts of his works, and ascertain whether they are giving satisfactory results. From time to time only will it be necessary to have his results independently checked by a more complete examination.

Standards whether necessary or not, are desirable. Experience has proven this and everyone who expresses an opinion on an effluent has a standard in mind. The same standard may not be desirable in every district, but in the great majority of districts the sewage to be treated is practically domestic in character, and contains so little manufacturing refuse that its character is not appreciably affected. The great majority of works have to discharge their effluent into non-tidal streams, so that the standard for any one of these may be accepted as the standard for all.

After a few remarks on attempts to settle upon standards he states that all authorities regard non-putrescibility as necessary in any standard, though they differ in their views as to how the putrescibility is to be determined. Many are in favor of a standard based upon the oxygen which the effluent will destroy or combine within a given time, but opinions differ widely as to how this oxygen destroying power is to be determined. The standard of the Mersey and Irwell Joint Committee quoted by a number of authorities is as follows:

The oxygen absorbed from an acid solution of permanganate of potash in three minutes should not exceed [illegible] grain per gallon.

The oxygen absorbed from the same solution in four hours at 80° F. should not exceed 1.00 grain per gallon.

The ammonia yielded by the albuminoid matter [illegible]

The chief difference between a good and bad effluent is in the amount of oxygen which it would require to oxidize the constituents of the effluent, the oxygen being obtained from the air. A good effluent absorbs or destroys very little oxygen, a bad effluent absorbs or destroys a relatively large amount of oxygen. The amount absorbed, however, varies much with the amount of suspended matter present; consequently the Royal Commission put their conclusions in the following way:

(1) That it should not contain more than 3 parts per 100,000 of suspended matter.

(2) That after being filtered through filter [illegible] should not absorb more than—

(a) 0.5 part by water per 100,000 of dissolved or atmospheric oxygen in 24 hours;

(b) 1.0 part by weight per 100,000 of dissolved or atmospheric oxygen in 48 hours; or

(c) 1.5 parts by weight per 100,000 of dissolved or atmospheric oxygen in 5 days.

The foregoing is a fairly definite standard but no hint is given as to methods of determination. There are two tests to make, one for turbidity, the other for oxygen absorption. An unfiltered effluent may be non-putrescible and yet absorb more than the amount of oxygen mentioned. When this is the case it is almost invariably due to its containing more than 3 parts of suspended matter per 100,000.

If a sample of unfiltered effluent does not absorb more than 0.5 parts of oxygen per 100,000 it will be very satisfactory, and if it does not absorb more than 0.55 it will be passable. In such cases the one test might be made to suffice, but it could be supplemented by a simple turbidity test which would enable the experimenter to decide, in a case where the oxygen absorbed was too high, whether this was due to an excess of organic matter in suspension or in solution.

A fully oxygenated sewage effluent will contain about 1 part of oxygen in solution in 100,000, and if it does contain nearly this amount, then, the sewage will prove to be non-putrescible, so that it is probable that the mere examination of an effluent to determine its turbidity and to ascertain that it is well oxygenated would answer every purpose. Tests of this kind are easily applied, and give in two or three minutes a very good idea of the quality of the effluent.

In the United States great stress is being laid upon the ratio of available oxygen in the effluent to the total amount of oxygen which the effluent is capable of absorbing, and in a paper just published, a simple test has been given whereby the sewage works manager can determine this ratio, but unfortunately, although it requires no skill, it takes four days to obtain decisive results if the effluent is good.

The paper mentioned is by Prof. Phelps, and is contained in a report entitled "Contributions from the Sanitary Research Laboratory and Sewage Experiment Station, Massachusetts Institute of Technology." The paper itself is entitled "Putrescibility and Stability of Sewage Effluents."

Referring to modern methods of sewage purification he says: "Suspended solids, available oxygen, and the character of the effluent in reference to its stability now demands first consideration"; and "As the production of a stable effluent is the primary function of such filters, the determination of such stability becomes the most important method of filter control." Later he describes a method of determining this stability which he has used for three years, and which enables him to express his results numerically.

We may take it that by a stable effluent is meant an effluent in which the dissolved oxygen and the nitrates present in it are sufficient to oxidize all the organic matter, and thus prevent putrefaction. In other words, a stable effluent is one which, if kept for a lengthened period in a closed air-free vessel, will not give rise to an offensive odor. Such an effluent is said to have a relative stability of 100. If the available oxygen is not sufficient then the relative stability is below 100. When the available oxygen in an effluent is not sufficient to secure proper stability, it is only a question of time for putrefaction to occur if the effluent is kept out of contact with air. The time, however, will vary with the temperature, the putrefactive bacteria developing more rapidly at a temperature approaching blood heat than at a lower temperature. The exact estimation of the time occupied by the organic matter to take up all the available oxygen in a filter-bed effluent is a tedious matter, requiring up to twenty-one days or more at room temperature and ten days or over at blood heat.

However, Prof. Phelps finds that in actual practice he can determine the relative stability with sufficient exactness for practical sewage work purposes in four days. His method is very simple. He completely fills small stoppered bottles of about ¼-pint capacity with the effluents, then tints each of them with a solution of methylene blue and places them in a cupboard kept approximately at a temperature of 68° F., and examines them daily for four days. So long as there is any available oxygen in the effluent the blue color is maintained, but as soon as it is all used the blue color disappears. The relative stability of each sample is then taken from the following table, which has been calculated from the results of numerous experiments.

RELATION BETWEEN RELATIVE STABILITY AND TIME REQUIRED AT 20 DEG. C. TO DECOLORIZE THE METHYLENE BLUE

Time.	Relative Stability.	Time.	Relative Stability.
12 hours	11	8 days	84
24 hours	21	9 days	87
36 hours	30	10 days	90
48 hours	37	11 days	92
60 hours	44	12 days	94
3 days	50	13 days	95
4 days	60	14 days	96
5 days	68	16 days	97
6 days	75	18 days	98
7 days	80	20 days	99

As a result also of the experiments made with filter-bed effluents at the works he finds that the average "relative stability" of an effluent which does not decolorize the blue in four days is 95. This figure may not be correct for any single effluent, but it will be very nearly correct on the average for a number of samples, and therefore a works which uniformly produces an effluent which does not decolorize methylene blue may be regarded as giving satisfactory results. A relative stability figure as high as 95 is never required under ordinary conditions to prevent putrescence, since the effluent must be discharged into some stream where it becomes diluted with water containing available oxygen, and as it is in contact with air it is continuously taking up oxygen. For these reasons an effluent which is putrescent when kept in an air-free sealed vessel may not putrefy or cause putrefaction when discharged into a stream.

This simple test is probably the best yet devised for the use of the sewage works manager, as it enables him with the minimum of trouble to test the effluent of individual beds. It merely requires a stock of stoppered bottles (size immaterial), a little solution of methylene blue, and a cupboard or incubator which can be maintained at a temperature of about 68° F.

If an effluent contains an excess of organic matter or a deficiency of dissolved oxygen and of nitrates, it will have a low relative stability, but it is almost invariably found that when there is little available oxygen there is an excess of organic matter in solution, or in suspension, or in both.

The standard suggested by the Royal Commission is more scientific than that of Prof. Phelps, but the former is intended for the use of skilled chemists and the latter for use by works foremen or others only desiring approximate results. An objection to Prof. Phelps' test is that it takes four days to discover whether an effluent comes up to the desired standard or not; meanwhile a bed or beds may be continuously discharging an unsatisfactory effluent. Dr. Thresh is inclined to prefer his own method, which he should like some of the members of the association to give a systematic trial, keeping records of the results.

It consists in determining the relative turbidity of each sample and the relative oxygenation. The relative turbidity is estimated in a graduated cylinder standing on a white disc bearing black squares. The effluent is shaken and then poured carefully into the cylinder until the individual black squares can no longer be identified. The length of the column should not exceed 100 mm. (4 ins.). The number of millimetres divided into 1,000 gives the relative turbidity figure. Thus if the col-

umn of effluent is 125 mm. long, the relative turbidity is 8; if it is 80 mm. long, the relative turbidity is 12½. The scale, however, can be made to give the relative turbidity without calculation.

To determine the relative oxygenation one portion of the effluent has to be saturated with air by thorough agitation; this gives the standard oxygenation, which he takes as 10.

With this a small stoppered bottle of about 150 c. c. capacity is filled, while a second and exactly similar bottle is filled with the effluent to be examined. Into each is dropped a pellet or soloid of caustic soda, or a few drops of solution of caustic soda and one of pyrogallic acid, or about ½ grain of the crystals. The stoppers are inserted so as to exclude any bubble of air, and the bottles are well shaken until the soloids or crystals have dissolved. A red brown color will develop, the depth of tint depending upon the amount of oxygen in the solution. By comparing the two it will be seen at a glance whether the effluent is well oxygenated or not. With a little practice one can give a relative figure which is sufficiently near for the purpose. A dilute solution of burnt sugar gives a very similar tint, and a set of solutions varying in tint from 1 to 10 may be kept for reference. For all practical purposes it is sufficient to find that the effluent is well oxygenated—i. e., that its relative oxygenation is above 7. If below 5 the effluent would not be regarded as satisfactory. This refers to effluents freshly taken. If they have been kept more than a few hours much of the oxygen may have disappeared. This fact suggests a variation of the test. A good effluent will retain some free oxygen after being kept in a full well stoppered bottle for twenty-four hours. If thoroughly saturated with air, it ought at the end of twenty-four hours, if kept at about 68 deg. Fahr., to still have a relative oxygenation figure of 5. To translate this into the words of the Royal Commission, the effluent would not have absorbed more than 5 parts of oxygen in twenty-four hours.

Dr. Thresh said he only recommends these tests as rough and ready tests for guidance of the sewage works manager and not as substitute for more scientific tests which can only be employed by an analyst. He does not wish to deprive any analyst of fees, and while recommending that the sewage works manager should make frequent and approximate tests, he also recommends that he should, as frequently as his authority will permit, have his results checked by complete analyses of typical samples. Without some tests for his guidance the sewage works manager is working more or less in the dark, and it is quite certain that if he can be persuaded to test his results daily or at frequent intervals it will be of advantage to himself and to the authority he serves.

In the discussion it developed that the possibility of a bacteriological standard being some day adopted was not pleasing. It would bring up the question of the condition of the stream above and below the discharge and complicate the manager's responsibilities. The problem of the manager now is to produce a non-putrescible effluent and the tests here given will enable him to judge his work. It was agreed that the sterilization of sewage does not remove the necessity for filtering before passing it to the stream. We are indebted to the Surveyor, London, for the opportunity to give the foregoing abstracts of the paper and discussion.

It is stated that the Department of Public Works in the Province of New Brunswick, Canada, has gone back to wooden bridges for spans between 50 and 180 ft. on highways. These wooden bridges are not painted and hot tar and lime are placed in all joints. After construction the bridges are completely housed in and roofed over. Some engineers place the life of a well designed and well built, housed in wooden bridge at 100 years. Protected by a tight roof it is believed the floors will wear out whereas now wooden floors generally fail by rotting.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Comparative Methods and Costs of Underground Conduit Construction.

BY CLARENCE MAYER*

As the purpose of this article is to compare methods and cost of constructing underground conduits for electric transmission lines and railway signal lines, the construction of manholes, while strictly a part of underground conduit work, will not be treated on account of the great variety of design, materials, and methods requiring a separate article for their description. Besides no true comparison of manhole construction methods and cost could be made, as manholes of different designs and sizes are required for street railway, electric light and power, telephone, telegraph, and railway signal conduits. This does not hold true of conduit itself, for a conduit which is free from deterioration, electrolysis proof, fire proof, has a smooth bore, and is quickly and cheaply laid, is practical for all classes of underground transmission.

Fig. 1 — Use of Iron Pipe Conduit on a Bridge.

In the brief scope of this article the writer gives in a few words the result of his experience in the actual construction of several million duct feet of underground conduit. In this work careful cost data were collected on the installation of more than 600,000 trench feet of city and country conduit work, large and small jobs, and on many kinds of conduit construction.

For the information of those who have never given underground conduit work much thought, a brief description of the most prominent kinds of duct now installed may be pertinent. These may be roughly divided into three classes: (1) Conduits of metal material; (2) conduits of vegetable material; (3) conduits of silicious material.

In the first class are: Wrought-iron pipe and cement line wrought-iron pipe.

In the second class are: Paper or fibre conduit and creosoted pump log.

In the third class are: Cement or stone conduit; single and multiple vitrified clay conduit, and monolithic concrete or cement conduit.

Conduit of metal material is rarely used except for continuing conduit over a bridge or trestle, or for terminating a lateral or for a short subsidiary conduit. Its cost and corrosiveness makes its use almost prohibitive. (Fig. 1.)

Although several types of monolithic conduit have been installed in recent years, mostly in St. Louis, this kind of conduit is not very practical on account of the length of time required for its installation, the difficulty of breaking into it without injuring cable where repairs are to be made due to a bad burnout, or an additional manhole or service box is required, the difficulty in securing the experienced labor required in monolithic construction, the expense of such labor and the liability of heterogeneous and defective construction incident to all molded concrete and cement work which must be done quickly and underground.

The length of time required to install conduit is important not only from a standpoint of cost and utility, but also because work in city streets must be quickly completed to avoid interruption of traffic and complaint of property owners.

In practical conduit work it rarely happens that the cement or concrete work is without defects, except, perhaps, where the work is very carefully done by experienced and skilled men, which means additional time and cost.

It is the teaching of experience that different batches of concrete are not always uniform in composition or consistency. It is therefore obvious that any conduit which is built entirely of this material is very liable to be defective. Another negative feature of monolithic concrete conduit is that it is by no means electrolysis-proof.

This latter objection is also made against cement or stone conduit and it is a very important objection. For the great demage done to cable by the ravages of electrolysis, annually amounts to a large sum of money, irrespective of the losses through interruption of service incident to such cable injury.

All concrete is porous enough to allow saturation of the mass by the acid and alkali solutions constantly present under streets. And though the mass itself may not be materially weakened by this process, the eroding solutions are allowed to seep quite freely through to attach the cable sheath. The concrete surface lying next to the cable becomes softened, scales off and distributes its debris through the duct so that in time the duct is of no more use for exchange and repulling of cables than the disqualified iron pipe.

Another detrimental feature of cement or stone conduit is its brittleness. It is rarely that a load is hauled from cars or storehouse to the work with a breakage of less than 6 or 7 per cent.

Cement or stone conduit is of circular shape and usually made in 3 or 6-ft. lengths with slip joints on either end. It is usually laid in an envelope of concrete 3 in. in thickness; the lengths are butted together within the aligning collar of iron which fits over the slip joints. In multiple conduit construction the ducts are built up in tiers, the formation being retained in place by clamps or by stakes driven into the bottom of the trench and removed upon completion of the side walls. Cement or concrete is placed and flushed between the layers of ducts so as to make a solid construction. Where two or more ducts are laid side by side all joints are staggered.

Most of the underground conduits installed today are either single or multiple clay duct, fibre, or creosoted wood. The preference is often caused by the market price of conduit materials and freight from factory to point of installation. In too many instances the first cost is the main item of consideration. There are, however, some conditions besides cost of material and installation that should dictate the kind of conduit to be laid.

For example, in localities where much water has to be contended with or where conduit is subject to constant and severe shocks as in the yards of great steel plants and the like, creosoted pump log is most practical. In streets crowded with underground pipes or

*Author of "Telephone Construction: Methods and Cost," Chicago, Ill.

where it is desired that ducts be isolated from each other in order that ground currents may be equally distributed over the greatest possible area of cable sheath, to minimize the local electrolysis, such as in street railway conduits, single duct tile should be laid.

Creosoted pump log, though most practical under certain rare conditions, for general conduit construction cannot be said to compare with either fibre or vitrified clay conduits in durability or insulating qualities, and its cost is greater than either fibre conduit or vitrified clay conduit as the ducts cost more and the creosoted stakes, cleats and protecting plank cost more than concrete and labor in mixing and placing.

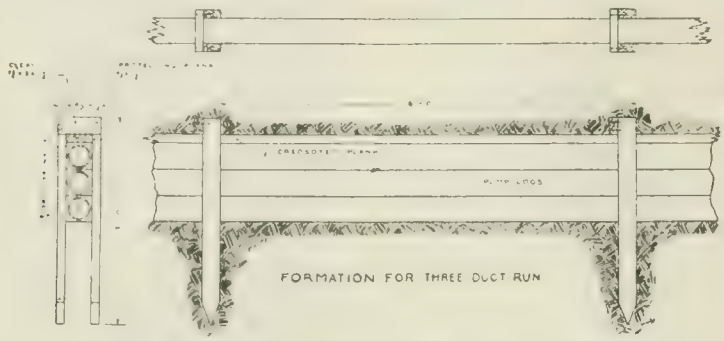

Fig. 2—Sectional Views of Pump Log Construction.

Creosoted pump log is generally laid without any special foundation. Where two or more ducts are required they are laid so as to break joints. Each duct is provided with mortise and tenon which simplifies alinement. When the pump log is laid and settled in position, a creosoted plank usually 1½ ins. thick and of width of the conduit is laid on top of the ducts. Stakes are then driven, one on either side, 3x1½ ins. x 3 ft, of creosoted lumber. These stakes are driven at intervals of 6 ft., are sharpened to a point and are driven with the 3-in. face parallel to the line of conduit. The tops of the stakes are bound together by a cleat, of the same size lumber as the stakes. The method of installing pump log is shown by Fig. 2.

There are other and cheaper methods of installing permanent and solid construction. Were either stakes or creosoted plank to be omitted, the formation would have no protection from foreign excavations which experience has shown to be imperative.

In a comparison of the cost of installing the two kinds of conduit which this article has narrowed to—fibre conduit and vitrified clay conduit—only the most economical and serviceable methods of construction are described. These methods have been standardized by the great public utility companies on the basis of their experience and the investigation of their engineers and the methods have stood the test of time.

Fibre conduit is usually laid in a 3-in. envelope of concrete. Where two or more ducts are required the ducts are laid so as to leave an interstice between the ducts of 1 in. Ducts are alined by means of male and female slip joints with which each length is provided and in laying the joints of each length are dipped in a liquid compound which seals the joint. Where the conduit cross section is large it is built up in tiers and the formation is held in place by stakes driven into the bottom of the trench or by removable guide racks at intervals of 6 ft. As each tier is laid concrete is flushed into the interstices between ducts and to a thickness of 1 in. on top of the ducts. The next tier is then laid and similarly concreted (Fig. 3). Where, as in railway signal conduit construction, ducts are laid between rails or tracks, and it is desired to concrete the entire formation in a single operation in order not to impede traffic or in order to cheapen construction cost, 1-in. duct supports or guide racks are placed at intervals betweens tiers of ducts both horizontally and vertically and the whole formation is held in place by stakes driven into the bottom of the trench on either side of the conduit formation. With this method the concrete although mixed in a semi-fluid condition will not always fill the interstices between ducts, especially in the lower tiers. See Fig. 4 and 5. Other objections to this method are the cost of supports or guides which must be left in the concrete and the weakening of the construction by the presence of these wood supports or guides.

Fibre conduit while generally considered a good insulator, is by no means fire-proof nor has it the durability of vitrified clay conduit. This is well shown by the data computed by a special commission, consisting of Prof. Dugald C. Jackson, Dr. George W. Wilder and William H. Crumb, appointed to investigate matters pertaining to the telephone situation in the city of Chicago. In connection with its report the commission gave the following data as to the life and depreciation of conduit:

	Life in years.	Per cent to depreciation account.	Per cent salvage.	Per cent to reconstruction and insurance
Underground conduit, main, clay in concrete.....	50	.89	0	1½
Underground conduit, main, fibre in concrete....	20	3.72	0	1½

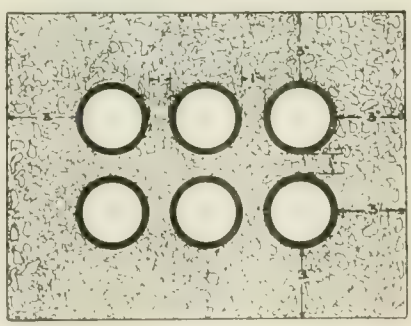

Fig. 3—Fiber Conduit with Concrete Encasement.

A vitrified clay conduit line when composed of a single duct is laid in a matrix of 3 ins. of concrete. Where multiple duct tile is laid, the trench is prepared with a foundation of 3 ins. of concrete. (Figs. 6 and 7). Upon this the tile is laid, and if multiple ducts are used, the ducts are centered by means of dowel pins which preserve alinement. The top and slides of each tile joint are covered with a strip of burlap 6 ins. wide to prevent the entrance of concrete, and all joints are staggered. The formation is then enclosed at the sides and top with a wall of concrete 3 ins. thick. Another and more economical method of installing vitrified clay tile which has been adopted by the Chicago Telephone Co. in most of their work, except in congested districts, and by other large companies, after a series of experiments covering several years, is to lay the tile on a 4-in. concrete foundation which is wide enough to extend 3 ins. beyond the outer walls of the conduit formation. On this foundation the tile is laid as already described, except that the tile joints are protected by strips of muslin or burlap dipped in neat cement paste extending smoothly over the end of each section of conduit at least 3 ins. on each side of the joints. After the joint has been made the entire surface of the muslin or burlap is covered with a ⅜-in. layer of 1:1 mortar. The sides of the trench are then filled with earth to a height level with the top of the ducts and a layer of concrete 3 ins. in thickness is placed over the ducts, extending 3 ins. on each side beyond the outside line of the ducts. This method of construction is shown by Fig. 8.

The cost of underground conduit construction while variable and depending on the location of work, size of job, rates of wages, price of material and competency of foremen, may still be figured with accuracy provided the data used are based on average cost of work done under average conditions.

It is often assumed that cost data to be of any value for comparative purposes must be based on work done under approximately similar conditions. Of course, to secure such data is obviously impracticable, as it does not often occur that two conduit lines are built under similar conditions, of the two kinds of duct which it is desired to compare. However, this is by no means necessary, for where distance of haul, character of soil and pavement, rates of wages and price of material are known and the cost data are carefully and systematically collected they may serve as accurate bases for comparing or estimating.

This is now generally recognized by most statisticians and the writer's personal experience has proven this beyond question. As an instance of this, the writer, when cost statistician for the Chicago Telephone Co., estimated the cost of installing a multiple duct conduit from 48th Ave. in the city of Chicago to LaGrange, Ill.—a distance of approximately 38,000 ft., and he came within less than $100 of the actual cost. This is not an isolated instance. Similarly close estimates have been

Fig. 4—Wooden Racks for Fiber Conduit Line Showing Holding Stakes.

made by the writer and others where based on actual cost records.

COST DATA.

The comparative cost table (Table I) is based on average costs collected by specially trained men using an identical system. They are not averaged from timing a few feet of work but from complete jobs, small and large, done in both city and country districts. On one job alone 824,862 duct feet of conduit were installed. This work was done by the Chicago Telephone Co. in combination with the American Telephone & Telegraph Co. to extend their conduit from Chicago, Ill. to Kenosha, Wis., and is one of the longest underground conduit lines ever built. The writer personally superintended the collection of cost data on this work and daily detail records of cost were kept. (For further details of this work the reader is referred to the author's "Telephone Construction: Methods and Cost." Chapter VI.—Myron C. Clark Publishing Co., Chicago.) These data together with those collected on many other conduit jobs are used as a basis for averaging the costs given in Table I.

Fig. 5—Wooden Racks and Concrete Encasement for Fiber Conduit Line.

Rate of Wages.—The following were the rates of wages paid for a nine-hour day:

Foreman	$3.50 to $4.00
Assistant foremen	2.50 to 3.00
Timekeepers	2.00 to 2.50
Watchmen	2.00
Waterboys	1.00
Laborers	2.00
Teams with drivers	5.00

Concrete.—Concrete is based on cement at $1.65 per bbl., sand and gravel at $1.90 per yard delivered on the ground, mixed in proportion of 1 part cement, 4 parts sand and 8 parts stone. Concrete was mixed by machine where possible. A considerable section of trench was excavated and graded and then the mixer was drawn along the side of the trench and an entire section of trench bottomed. The ducts were then laid and concreted on sides and top in one operation. In the case of fibre conduit, the bottom was placed as described for vitrified clay conduit, and as each tier of ducts was laid, concrete was placed and tamped in order that no interstices might be left between ducts.

Laying Conduit.—Conduit was laid by unskilled labor. Two men were used in the trench and one handing conduit, dowel pins, and preparing burlap or compound for joints as the case might be. The conduit layers were usually picked men and were kept continually on this work.

Resurfacing.—All pavements except in unimproved and macadamized streets and roads were repaired by contractors. In the cost table the resurfacing is not shown because there are many kinds of pavements, varying in cost in different localities, and whether the trench is a few inches wider for one construction than another makes no difference in cost of resurfacing as paving contractors charge the same yardage. This is proven by the experience of everyone who has ever installed a conduit line.

Trenching.—The cost of trenching is based on average clay soil which is the most usual soil encountered in this country. In trenching, any conduit requiring less than a 15-in. trench, costs practically the same to excavate as a 15-in. trench. The reason for this is that a trench less than 15 ins. wide impedes the free working of the men, where a trench is deep enough to permit the top of the conduit formation to be 2 ft. below street level as is generally required. Then, again, experience has shown that it is almost impossible to get men to dig a trench less than this width unless a foreman is placed over each man.

Unloading and Distributing.—Unloading and distributing conduit is based on an average load over overage distances and road conditions being $.0023 per duct foot for vitrified clay conduit and $.0016 per foot for fibre conduit, with 2-horse trucks costing $5 per day with driver, carrying 5 loads per day.

Conclusion.—As will be seen by the Cost Table the cost of installing fibre conduit is considerably more than for vitrified clay conduit and when we take into consideration the fact that vitrified clay will last over two and one-half times as long as fibre conduit, it is obvious that from a standpoint of either first cost or final cost, vitrified clay conduit is much cheaper to install though the vitrified clay conduit itself may be more expensive.

There are many points which lead inexperienced men to believe the cost of laying vitrified clay conduit to be higher than it actually is. For example, it is often thought that a mandrel is required in laying multiple tile and that skilled men are needed to lay the tile. Of course a mandrel may be used as may skilled men, but neither is used by competent conduit men. If vitrified clay tile be laid as described in this article, it would be only necessary to run a cleaner through the ducts when rodding to remove any concrete which may have entered through joints and this operation would add nothing to the cost of rodding.

Vitrified clay tile are superior to any other kind of ducts because they form a solid and permanent conduit, irrespective of the concrete envelope which only adds a secure foundation and protection from foreign excavations. As has already been pointed out concrete on the sides of vitrified clay tile is more or less superfluous. With fibre or any other ducts laid in concrete, the concrete is indispensable and the important part of the construction. This is especially true of fibre conduit, for on account of its composition it is useless unless encased in concrete as the fibre simply acts as a mold forming ducts in the concrete. It is therefore clear that while the concrete may be a very cheap mixture and imperfectly placed without seriously affecting

Fig. 7—Single Duct Clay Conduit Construction with Complete Concrete Encasement.

Disposal of surplus earth	.0336	.0321	.0167	.0392
Supervision 5% of total	.0286	.0279	.0232	.0344
Total cost per trench ft.	[illegible]	$0.5848	[illegible]	$0.7218
Total cost per duct ft.	[illegible]	$0.1462	[illegible]	$0.1805

the permanency or value of a vitrified clay conduit, in the case of fibre conduit, the concrete unless rich, and well placed and tamped will soon deteriorate.

Another serious objection to fibre conduit is that when subjected to heat of a summer day such as is encountered in Southern states, most of the year, it will soften and lose its shape so that in laying the concrete will flatten or partially flatten the ducts. The experience

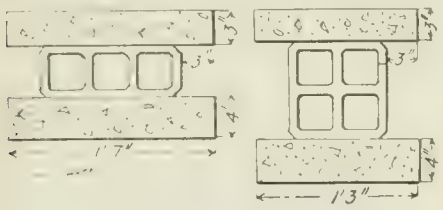

Fig. 8. Multiple Duct Clay Conduit with Partial Concrete Encasement.

of any conduit contractor in the south has proven this.

While it is claimed that fibre conduit is a good insulator, vitrified clay conduit being virtually cheap glass is practically a perfect insulator where as the vegetable nature of fibre conduit would leave some doubt as to its insulating qualities.

In the case of electric light conduit built with fibre ducts, experience has shown that at certain hours of the day where the load is heavy such as at hours when stores, offices, sign and street lights are all in use, overload sometimes occurs, causing the cable to become hot, which in turn heats and softens the fibre conduit. In the course of time this causes the cable to sink into the conduit, making it impossible to remove.

In a discussion before the Transvaal Institute of Mining Engineers Mr. H. Kerseur says: In this connection I have noticed that several mines on the Rand are installing electrically-driven air compressors, and as air compression has a certain fascination for me I tried to investigate the reasons for this method of driving. I think electrically-driven compressors are only adopted because the mines believe that method is more economical I beg to state, however, that electrically-driven compressors are about 25 to 50 per cent less in economical working than steam driven —especially for the larger units. As it would make this contribution too lengthy, I refrain from giving you the reasons and figures hereon, but I intend to come back to this subject in the near future and prove to you my above assertion. In my opinion it is only justifiable to adopt an electrical drive for compressors if there is some surplus electric power which could not be used in some other way.

The Kenefick-Quigley-Russell Construction Co. of Denver, Colo., and Kansas City, Mo., has been awarded an additional contract by the Denver Reservoir Irrigation (Strandley) Co. for the construction of a large canal from Barr lake to a point 18 miles east of Hudson. The canal will be an enlargement and extension of the Neres canal, branching from it at Hudson, and will cost $500,000.

LETTERS TO THE EDITOR.

A Design for a Stadia Rod.

Sirs: A design shown in the issue of Engineering-Contracting for Nov. 17, 1909, prompts me to send a description of a stadia rod which I have designed and given a thorough trial. It is made to be seen. I use rods about 3 ins. wide. As will be seen from the drawing, it is graduated to 0.05 ft., leaving the intermediate points to be estimated with the eye. Having the graduations for alternate feet on alternate

Design for a Stadia Rod.

[illegible] the rod enables one to see them a long [illegible] off and there is also plenty of white background at all points on the rod.

Yours truly,

F. O. NELSON.

Estherville, Ia., Dec. 18, 1909.

Contract Labor Compared with Day Labor and Rate vs. Amount of Wages.

Sirs: A letter from Thomas Flynn in the Dec. 29 issue on the subject of wages was interesting to me. Mr. Flynn [illegible] read more political than economic literature and his epistle is a very pretty plea along the lines of protection to home industry. Now my experience has proven to me that a contractor does not always pay less than the city. My experience and a very careful study, as the result of which a new book on economics may appear, prove that the rate of wages is independent of the amount of wages. The cost of a highway per mile, to choose a familiar example, is about the same in every country of the world under the same specifications, yet the rate of wages may be as low as 2 cents per hour in one country and as high as 30 cents per hour in another As you stated in your reply to Mr. Flynn, "The cheapest labor in the world is the most economic."

In municipalities there are favored employes. Civil War veterans must be employed whether fit or not in a great many places. If the youngest soldier in that war was 20 years old on the day of his discharge he must now be at least 64 years old, yet the writer within the past three years had to employ four veterans under an old ordinance. No one grudged the old men their jobs and no one objected to paying them $2 per day of eight hours. The effect, however, on a gang of men working alongside unfit men, was so bad that the writer finally carried them on the payroll at full pay so long as they kept away and permitted him to drive the other laborers. It happens often that councilmen and politicians have certain friends, relatives or family connections who must be employed. The writer has been a city engineer for years and knows whereof he speaks. In one city the council wanted to adopt the policy of doing all work by day labor and the writer protested. Finally a test was made on two identically similar pieces of street work, the specifications being the same and length and width identical, therefore the estimates of cost being alike. One piece was let by contract and the other was done by day labor under charge of the chairman of the street committee, the man who favored the day labor idea. In his early years he had been a contractor, and it was feared the writer, being opposed to day labor work, would not push things properly, so he was relieved from his duties and another engineer engaged.

The writer preserved a perfectly neutral attitude and watched the work closely. The contractor put in a lump sum bid for his job, which was [illegible] per cent below the estimates of the writer. The organization and carrying out of both pieces of work were excellent and the chairman of the street committee was all right as a boss. The spirit on the two jobs was different and the difference was noticeable. The contractor was free to employ whom he chose and kept only the men who worked. Naturally he paid much higher wages than were paid on the city job, which was considered a snap. He infused spirit into his men and claimed to have made a good profit, which nobody doubted The superintendent on the city job had little choice in the selection of his men. The first men employed were put on the payroll to favor his colleagues on the council and certain friends and interests. This gave him a nucleus with whom good men did not care to work. The men he secured later were those fired by the contractor. His job cost 20 per cent more than the contract job and was no better done.

To answer another part of Mr. Flynn's letter in which reference is made to traits in human nature. A man can be proof against financial bribery when a hard luck story will touch his heart and make him untrue to his employer. If the man in charge of day labor work can steel his heart there are men higher up who can make him less exacting if they are annoyed by the importunities of the friends of the men who believe themselves oppressed. On contract work the contractor is moved entirely by personal interest and so are his men. To hold their jobs they must be guided by him whose sole motive is financial profit. On day labor work all men are swayed by personal interest. To hold their jobs they must be guided by the man above whose interest is personal ambition and seldom financial profit. Votes, not dollars, measure his profit, and each laborer is a voter. The city engineer as a superintendent must not lose votes, precisely as the superintendent for the contractor must not lose dollars.

D. H.

Chicago, Ill., Dec. 28, 1909.

The Use of Oils for Lining Irrigation Canals.

Sirs: Being greatly interested in an important subject relating to the building and main-

tenance of irrigation canals, and having the privilege of being a subscriber to your valuable paper, I have not hesitated to address you, respectfully asking for some information about that matter.

I am now charged with very important works in this district, tending to the improvement of a large and costly irrigation canal. This latter is built through very soft soil and the greater part of it runs on embankment, thus endangering its preservation and causing big losses through seepage. I am now making designs to deepen the canal, the slope of the ground making it possible in long tracts, and studying the means of preventing, as far as it is practicable, the great losses from seepage.

I have read in an American technical paper about some successful experiments made in lining irrigation ditches with crude petroleum, and should like to have more detailed data on this important subject. It would be specially interesting for me to know if that process of lining canals has left the experimental stage and is being practically applied in some parts of the United States, and if so, where and to what extent, as I might take a trip and study such works personally.

Very truly, V. S.

Sacramento, Mexico, Dec. 20, 1909.

(The best information perhaps which our correspondent can easily obtain regarding the use of asphaltic oils for irrigation canal lining is contained in a bulletin published by the Agricultural Experiment Station of the University of California, Berkeley, Cal. This bulletin describes a series of tests made to determine the effectiveness of various linings for irrigation canals and was abstracted in some detail in ENGINEERING-CONTRACTING for Dec. 2, 1908. Oil for lining irrigation ditches has been used only in California, so far as we know, and, according to reports, with varying degrees of success.—Editors.)

Cost of Cleaning Streets with Hand Brooms.

Sirs: We read with much interest the report of Mr. Samuel Whinery, Consulting Engineer, New York City, in regard to street cleaning in Boston, Mass.

Have you any data on file as to the average cost per thousand yards of cleaning with hand brooms in some of the larger cities. If we are not presuming too much, we would appreciate any information you can give us.

Yours truly, C. F. R.

South Bend, Ind., Dec. 22, 1909.

(The editors have at the moment no data on costs of cleaning streets with hand brooms and a search of the literature immediately at hand gives no very satisfactory information. We shall be glad to hear from our readers on this matter.—Editors.)

Roughening the Surface of Old Cement Walks.

Sirs: We have in this city a number of walks on which apparently too much steel trowelling was done at the time they were built and the surface is so smooth and slippery that in wet or frosty weather they are dangerous to pedestrians. I would like to inquire from you, or through the correspondence columns of your paper, whether anyone has tried acid on old walks to produce a rough surface. Any information about any approved method of obtaining this result will be appreciated.

J. S. McCULLOUGH.

Fond-du-Lac, Wis. City Engineer.

(Acid wash was tried on two sidewalks of which the editors know and was successful enough but the work was done in midsummer. The walks were three years old. Muriatic acid 1 part and water 2 parts was the wash used. It was done a number of years ago and the costs are not available. Some of the wash got into expansion joints and caused some trouble. A good way to roughen the walk is by bush hammering. This work costs from 1½ cts. to 2½ cts. per sq. ft. Hand hammers may be used or pneumatic hammers with portable compressor operated by gasoline engine. A small hand hammer operated by electricity has lately been put on the market. We hope our readers can give some data on the acid etching.—Editors.)

A Bag of Cement and One Cubic Foot.

Sirs: In your editorial of Dec. 22 you suggest that a bag of cement weighing 95 lbs. be accepted as a unit and nearly equivalent to 1 cu. ft. Why not make the bags weigh 100 lbs. and therefore more nearly equal to 1 cu. ft.? It would be well if we used 100 lbs. as a unit for nearly everything used by weight.

P. C. KNIGHT.

Pontiac, Ill., Dec. 24, 1909.

Sirs: All practicing engineers will thank you for a move in the right direction of considering a bag of cement as one-quarter barrel. Your move for 95 lbs. as a bag weight is nearly the same as accepting the "sack weight" of cement stipulated or specified Aug. 15, 1908, by Article 7, that is, "net 94 lbs." for Portland cement. (The writer does not say where the Article 7 belongs.—Editors.) This was the correct move at that date to establish uniformity for a barrel weight, the net contents being thus made 376 lbs. The quarter of that is 94 lbs., the "net weight" of a sack.

FRANK P. KELLOGG.

Chicago, Ill., Dec. 24, 1909.

Sirs: Your editorial advocating a "bag" of cement as a unit instead of a barrel is not a satisfactory solution of the problem, as it simply substitutes another indefinite and irrational unit for the one now existing.

A barrel of cement is a unit of measure by custom only and has no definite weight. The usual weight is 380 lbs. for Portland cement and about 265 lbs. for natural. The U. S. Army Engineers' specifications say 375 lbs. of cement is a barrel. Other published information gives other weights as being correct for a barrel of cement.

One of the greatest nuisances engineers have to deal with is the tendency of manufacturers and dealers in nearly all classes of supplies to establish standards and measures peculiar to their products. Cement is in reality all sold and transported by weight and mixed by volume, so why should we not use the ordinary legal measures of weight and volume? That is, buy the cement by the hundred pounds net, and the manufacturers would soon discover that it was convenient to put 100 lbs. of Portland cement into a sack instead of 94 to 96 pounds as at present. In order to simplify the proportioning, specifications should state that 100 lbs. of cement will be considered to be 1 cu. ft., or 1.1 cu. ft., whatever is correct in the judgment of the engineer. Let us drop the use of the term barrel as a measure of cement, but do not adopt another unit which is peculiar to the one industry, but rather adopt a unit which has a definite legal value and is understood by anyone who knows the usual weights and measures.

Yours truly,

O. W. CHILDS.

St. Louis, Mo., Dec. 27, 1909.

(The above letters are given as a sample of the comments received on the editorial about what constitutes 1 cu. ft. of cement. We ask our readers kindly to bear in mind that we made no recommendations as to the weight of 1 cu. ft. of cement. We simply suggested that engineers fall into line with the manufacturers who now have a standard size bag into which is placed as near as may be, 94 lbs. net of cement. We suggested that this bag be assumed as being equal to 1 cu. ft. of cement and as a contractor has no means of emptying and weighing the contents to determine the "net weight," that the specifications call for a "gross weight" of not less than 95 lbs. We are not suggesting anything new. On this point a further discussion will be found in the editorial pages.—Editors.)

Diamond Drilling Records and Costs.

Sirs: I would like to get a line on diamond drill records and costs in different parts of the western country, including Mexico, British Columbia and Alaska; also a system of cost keeping for diamond drill work.

Yours very truly, H. D. S.

Portland, Ore., Dec. 22, 1909.

(Costs of diamond drill borings in Colorado were given in our issue of March 13, 1907; costs of diamond drill borings in Mexico were given in our issue of April 29, 1908, and costs of diamond drill borings in British Columbia were given in our issue of May 6, 1908. Other useful articles on diamond drill costs will be found in ENGINEERING-CONTRACTING for Jan. 9 and March 13, 1907, April 21, July 28 and Sept. 8, 1909. Cost-keeping systems and blanks for diamond drill work will be found described in "Cost Keeping and Management Engineering" by Gillette and Dana.—Editors.)

A Definition of Terms Used to Designate Engineers.

Sirs: Do you know of any book, either legal or engineering, that defines the different qualities of Consulting, Constructing, Contracting, etc., Engineers and their duties? These different prefixes are used extensively and many people are liable to take one for the other.

A. THOMAS.

Detroit, Mich., Dec. 24, 1909.

(We are not acquainted with any book or books, giving the desired information. A consulting engineer should be a man, who, because of study added to wide experience, is qualified to give advice on engineering work to men less well informed. It was formerly a title of high distinction but is now meaningless because every man assumes it who goes into private practice. A consulting engineer in common opinion is an engineer not steadily employed on a salary and when a salaried engineer is consulted on special work he is, for the time being, a consulting engineer. A constructing engineer is a man educated as an engineer—or who assumes the title—and is placed in charge of construction work. He is compensated by a salary, fee or percentage of cost or profits. When such a man contracts to do the work he is a contracting engineer. Contractors in charge of work involving something more than the problems connected with ordinary small building operations are today generally termed engineering-contractors. The engineer himself is "the ingenious man," the name having the same root form as the word "ingenuity." The modern engineer must assist his native ingenuity by adding to it a good education in mathematics, applied science and a knowledge of costs and methods of construction work.—Editors.)

Corrosion of Steel in Concrete Sea Walls.

Sirs: I note with interest the query on page 552 of Engineering-Contracting for Dec. 22, in regard to corrosion of concrete reinforcement by salt water. Am sending you under separate cover a bibliography which may be of interest to you along this line. Concrete protection is treated on page 44.

Very truly yours,

E. H. McClelland,

Technology Librarian Carnegie Library.

Pittsburg, Pa., Dec. 24, 1909.

(The bibliography referred to is entitled "Metal Corrosion and Protection. References to Books and Magazine Articles." Second Edition. Revised and Enlarged, 1909. It contains 64 pp., 6 x 9 ins. and will be mailed for 10 cts. About 4½ pages contain references to articles on metal encased in or protected by concrete. The Society of Scandinavian Portland Cement Manufacturers presented a report on Cement in Sea Water to the International Association for Testing Materials in 1909. The report deals with experiments made in Denmark, Sweden and Norway but no mention is made of reinforced concrete. This

report can be had for $1.25 printed in English. Prof. M. Möller presented a paper at the same convention entitled "The Use of Reinforced Concrete Beside the Sea." This paper has also been printed in English.—Editors.)

Technical Society Meetings.

The list following names those technical societies in which engineers and contractors are most interested, whose meetings are to be held within three months of the date of this issue. There are given for each society listed the date and place of meeting and the name and address of the secretary, to whom all communications and inquiries should be addressed.

American Society of Civil Engineers.
Jan. 19-20, 1910. Annual meeting at New York City. Secy., Chas. Warren Hunt, 220 W. 57th street, New York, N. Y.

Canadian Society of Civil Engineers.
Jan. 25-27, 1910 Annual meeting at Ottawa, Ont. Secy., C. H. McLeod, 413 Dorchester St., West, Montreal, Que.

American Society of Engineering Contractors.
Feb. 24-26, 1910. Annual convention at Chicago, Ill. Secy., Daniel J. Hauer, Park Row Building, New York, N. Y.

American Society of Heating and Ventilating Engineers.
Jan. 18-20, 1910. Annual meeting at New York City. Secy., W. M. Mackay, P. O. Box 1818, New York, N. Y.

American Society of Inspectors of Plumbing and Sanitary Engineers.
Jan. 20-22, 1910. Annual Convention at Trenton, N. J. Secy., C. S. McCosker, Mobile, Ala.

Canadian Society of Civil Engineers.
Jan. 25-27, 1910. Annual meeting at Ottawa, Ont. Secy., C. H. McLeod, 413 Dorchester street west, Montreal, Que.

Connecticut Society of Civil Engineers.
Feb. 8, 1910. Annual meeting at New Haven, Conn. Secy., J. Frederick Jackson, Box 1304, New Haven, Conn.

Illinois Association of Municipal Contractors.
Feb. 24-26. Annual meeting at Chicago, Ill. Secy., Orie T. Dunlap, Edwardsville, Ill.

Illinois Lumber Dealers' Association.
Feb. 16-18. Annual meeting at Chicago, Ill. Secy., Geo. K. Hotchkiss, 315 Dearborn St., Chicago.

Illinois Masons' Supply Association.
Feb. 16-18. Annual meeting at Chicago, Ill. Secy., Geo. K. Hotchkiss, 315 Dearborn street, Chicago.

Illinois Society of Engineers and Surveyors.
Jan. 26-28, 1910. Annual meeting at Cairo, Ill. Secy., E. E. R. Tratman, 1636 Monadnock Block, Chicago, Ill.

Indiana Engineering Society.
Jan. 14-16, 1910. Annual convention at Indianapolis, Ind. Secy., Chas. Brossman, Union Trust Bldg., Indianapolis, Ind.

Interstate Mantle and Tile Dealers' Association.
Feb. 15-19. Annual meeting at Chicago, Ill. Pres., Joseph W. Lantry, Wm. H. Jackson Co., Union Square, New York City.

Iowa Association of Cement Users.
March 9-11, 1910. Annual meeting in Cedar Rapids, Ia. Secy., Ira A. Williams, Iowa State College, Ames, Iowa.

Iowa Engineering Society.
Feb. 16-17, 1910. Annual convention at Cedar Rapids, Ia. Secy., A. H. Ford, Iowa City, Ia.

Michigan Engineering Society.
Jan. 12-14, 1910. Annual meting at Lansing, Mich. Secy., Alba L. Holmes, 574 Wealthy Ave., Grand Rapds, Mich.

Montana Society of Engineers.
Jan. 6-8, 1910. Annual meeting at Butte, Mont. Secy., Clinton H. Moore, Butte, Mont.

National Association of Cement Users.
Feb. 21-25, 1910. Annual meeting at Chicago, Ill. Secy., Geo. C. Wright. Address all communications to Edw. E. Krause, Asst. to the President, Harrison Bldg., Philadelphia, Pa.

National Builders' Supply Association.
Feb. 23-24. Annual meeting at Chicago, Ill. Secy., James W. Wardrop, Frick Building, Pittsburg, Pa.

National Brick Manufacturers' Association.
Feb. 7-12, 1910. Annual Convention at Pittsburg, Pa. Secy., T. A. Randall, Indianapolis, Ind.

Northwestern Cement Products Association.
March 1-5, 1910. Annual meeting in St. Paul, Minn. Secy., A. E. Pfiffner; Pres., Martin T. Roche, Pioneer Press Building, St. Paul, Minn.

Ohio Engineering Society.
Feb. 15-17, 1910. Annual meeting at Columbus, Ohio. Secy., C. J. Knisley, New Philadelphia, Ohio.

Personals.

Mr. Walter Loring Webb, M. Am. Soc. C. E., has become associated with the Roberts & Abbott Co., Consulting, Supervising and Operating Engineers, of Cleveland, O., and will represent that company at Philadelphia, Pa., and vicinity. Mr. Webb's office will be as heretofore at 1026 Real Estate Trust Bldg., Philadelphia, Pa.

Mayor Gaynor of New York City has made the following appointments: Commissioner of Docks, Calvin Tomkins, Assoc. M. Am. Soc. C. E.; Commissioner of Bridges, Kingsley Martin, M. Am. Soc. C. E., heretofore Chief Engineer Department of Bridges; Commissioner of Water, Gas and Electricity, Henry S. Thompson. Prof. Edward Bemis, at present head of the Water Department of Cleveland, O., has been appointed First Deputy Commissioner under Mr. Thompson.

Mr. Harry C. Hill, heretofore Assistant State Engineer of New Hampshire, has been appointed State Engineer, succeeding Mr. Arthur W. Dean, who has become Chief Engineer of the Massachusetts Highway Commission, as noted in our last issue. Mr. Hill was graduated from the Thayer School of Engineering at Dartmouth College in 1903, and served for some time as a transitman and assistant engineer for the New York Central & Hudson River R. R., near Corning, N. Y., and at New York City.

Mr. C. H. West, Chief Engineer of the Mississippi River Levee District, of Greenville, Miss., has been appointed a member of the board of Mississippi River Levee Commissioners. Mr. West was educated in the University of Illinois and first engaged in railroad surveying, which he followed until 1893. In that year he was appointed an engineer of the federal government on the Mississippi River and continued in this capacity until 1898, when he was elected chief engineer of the board of levee commissioners.

Mr. John T. Featherson, of New York City, as the result of the recent civil service examination held by the city of Chicago, will probably be the next superintendent of streets of that city. The results of the examination were posted on Dec. 31, and it was found that Mr. Featherson lead the list with a mark of 92.8 per cent. The list of the 16 men who averaged above the passing grade of 70 is as follows: John T. Fetherston, New Brighton, N. Y., 92.80; John B. Hittle, 832 Leland Ave., 84.15; Cicero D. Hill, 1722 West 101st St., 83.90; John H. Moore, Evanston, 82.63; Parke G. Anderson, Moline, Ill., 81.36; Frank T. Fowler, 915 Lakeside Pl., 80.06; Charles B. Ball, 4347 Hazel Ave., 80.02; Jean B. Balcomb, 5208 Lyon St., 78.23; Michael English, 3951 West Harvard St., 76.27; Abraham M. Milner, 649 East 37th St., 74.40; Michael E. Murray, 120 North Park Ave., 73.49; Walter G. Leininger, 125 South Prairie Ave., 73.10; Thomas F. McGrath, 110 South Hamlin Ave., 72.62; William J. Higgins, 1633 Francisco St., 72.52; Edward D. Very, Brooklyn, N. Y., 71.56; Daniel W. Maher, 5001 Greenwood Ave., 71.16. Mr. Fetherston is 35 years old, and was graduated from the University of New York in 1897, with a degree of civil engineer. At present he is Superintendent of Street Cleaning for the borough of Richmond. He installed the English method of garbage reduction in Brooklyn and under Col. Waring made a thorough study of European methods of street care. The position carries a salary of $5,500 per year

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Steam Specialties.—Cloth, 6x9 ins., 186 pp Albert Schade Co., Philadelphia, Pa.
This is a very complete catalog describing all of the appliances and tools required by steam users, plumbers and stationary engineers.

The Use of Meters. — Pittsburg Meter Co., East Pittsburg, Pa.
This company sends in a number of circulars giving statistics of water consumption and reports from a number of cities where meters have been installed.

Hauling Machinery.—Paper, 8½x11½ ins., 64 pp. The Avery Co., Peoria, Ill.
This is a very complete catalog for the use of contractors and other men using traction engines. Special attachments for the Avery Double Mounted engine consist of steam cranes and rollers, so that the engine may be used as a scraper-excavator, as a hoisting engine and as a road roller, as well as being used for hauling trains of wagons.

Road Machinery Catalog.—Paper, 4x9 ins., 44 pp. Petrolithic Pavement Co., Los Angeles, Cal.
This catalog describes machinery for roughing the surface of roads and also describes the petrolithic rolling tamper and a machine for oiling roads. It also contains specifications for petrolithic macadam roads as constructed in Los Angeles, Cal., with tables giving quantities of oil and broken stone for roads of different widths.

Special Hauling Machinery.—Paper, 9x12 ins., 36 pp. Buffalo Pitts Co., Buffalo, N. Y.
The use of road engines to haul trains of wagons is becoming common. This catalog contains a description of the Buffalo road engine for such purposes and gives dimensions of wagons used in connection with these engines; illustrated with views from many parts of the United States.

Office and Field Instruments.—Cloth, 6x9 ins., 543 pp. Keuffel & Esser Co., 111 E. Madison St., Chicago, Ill.
This is the thirty-third edition of the catalog of this firm now so well known to draftsmen, surveyors and engineers that it hardly requires a special notice. Every tool, instrument or article required in the office or field by the engineering profession is here illustrated and priced Two new slide rules are illustrated.

Boiler Tests.—Heine Safety Boiler Co., New York City.
This firm sends in a number of pamphlets containing records of tests made on boilers of the Heine type.

Water Filters.—The Moore & White Co., Philadelphia, Pa.
This circular describes the Fullner Filter for removing suspended matter from water, used especially in paper mills.

Wood Pipe.—National Wood Pipe Co., San Francisco, Cal.
This circular is an envelope size folder describing the manufacture of continuous woodstave pipe to be used in city water works, irrigation systems, power plants, etc.

Contractors' Machinery.—Paper, 5x8 ins., 56 pp. Cropp Concrete Machinery Co., 84 LaSalle St., Chicago, Ill.
This catalog describes the Cropp concrete mixer and a line of engines, boilers, hoisting engines and rock crushers.

Metal Cutting and Welding.—Paper; 6x9 ins., 24 pp. The American Oxhydric Co., Milwaukee, Wis.
The oxy-hydrogen process of cutting iron and other metals is coming into use generally by contractors and this catalog gives about all the information a contractor needs to enable him to cut and weld metals by this process.

ENGINEERING-CONTRACTING

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

Several large contracts on the New York State Barge Canal were awarded the last of the year. The largest of these contracts called for the construction of a little over seven miles of canal west of Rome, the work being secured by Scott Bros., Baldwinsville, N. Y., at $1,748,679.——The Elmore & Hamilton Contracting Co., Albany, N. Y., was on Dec. 24 awarded the contract for constructing the Grassy Sprain cut and cover, Platt Ave. siphons and portions of the Ardsley cut and cover for the Board of Water Supply of New York city.——One of the largest railroad contracts of the week was secured by the James McGraw Co., Philadelphia, Pa. This contract calls for the construction of the new Pennsylvania line through Bristol, Pa., and involves a considerable amount of grading and concrete masonry. Another large railroad contract was secured by the Miller Construction Co. of Lock Haven, Pa. This contract calls for nine miles of double track, grade and line revision between Newton, Pa., and Mt. Jewett, Pa., for the Buffalo, Rochester & Pittsburg Ry. The work will cost about $800,000. Still another good sized railroad construction contract was received by Willett & Burr, San Francico. This contract calls for the extension of the Northwestern Pacific R. R. from Willitts to Shirley, and the work includes grading, tunnelling and masonry.——One of the largest ditch contracts of the week was secured by G. A. McWilliams, Walnut, Ill. This contract was for the construction of the Knox ditch in Fremont County, Ia., and calls for about 807,600 cu. yds. of dredge work.——A large levee and ditch job is to be let at Carrollton, Ill., on Jan. 20 by the Eldred Drainage and Levee District, the work calling for the construction of a levee containing 1,492,759 cu. yds. and a drainage ditch requiring 192,730 cu. yds. of excavation.——The Kenefick-Quigley-Russell Construction Co. of Denver, Colo., and Kansas City, Mo., has been awarded an additional contract by the Denver Reservoir Irrigation (Standley) Co. for the construction of a large canal from Barr lake to a point 18 miles east of Hudson. The canal will be an enlargement and extension of the Neres canal, branching from it at Hudson, and will cost $500,000.——It is strongly believed in Denver and Salt Lake City that the Denver, Northwestern & Pacific Ry. (Moffatt line) is to be built to Salt Lake City this year. At present the road is completed for several miles beyond Steamboat Springs, Colo.——The El Paso & Southwestern system has announced that there is no work contemplated on an extension of its lines to the A., T. & S. F. Ry. in New Mexico.——The rumored intention of the Baltimore & Ohio to construct a third track between Pittsburg, Pa., and New Castle, Pa., seems also to have originated from shanty house talk, for we are advised that nothing is to be done in that locality.——The Canadian Northern Ry. has taken over the charter and interests of the Victoria & Barclay Sound Ry. Co. of Victoria, B. C., thus greatly expediting preliminary arrangements for the construction of the Vancouver Island portion of the C. N.

Some Early Railroad Records.

The present day methods of railroad construction are a great advance over the methods of the early days. And yet those old time contractors were no slouches in stringing rails across a continent, as witness the records made on the Canadian Pacific Ry. by D. C. Shepherd in the early '80s. Mr. Shepherd, by the way, is still living, and in a few days will be 82 years old. He retired from contracting work in 1894. His history may be said to be the history of railroad building in the northwest for that period, for in the 24 years of his activity as a contractor, the company of which he was a member, built 6,666 miles of railroad in that section of the country. Another distinction of which Mr. Shepherd is rather proud is that of being the builder of the first railroad in Minnesota. He came to St. Paul in 1857, when that city was a village and Minnesota itself a territory, and in that same year made a survey for a railway from Stillwater by way of St. Paul and Minneapolis to Breckenridge and from Minneapolis up to the old Indian trading post of Crow Wing. In the spring of 1858 with two other men he drove out to break the ground for this railroad. The dedication ceremonies were simple, consisting merely of turning over a shovelful of dirt and breaking the top of a bottle of champagne. The ceremonies took place at a point just south of what is now Calvary cemetery, on the Como line, at St. Paul, at a spot where the old kind of wheelbarrow grading could be done. This railroad was not actually completed for many years, part of it never. In 1863 Mr. Shepherd became chief engineer for the Minnesota Central Ry. Co., which was then running lines into southern Minnesota and Iowa. He remained with the company until the spring of 1870, when he became a member of the Northwestern Construction Co., and his active life as a contractor began and continued uninterruptedly until he retired in 1894. In the period from 1870 to 1894 the firm of which Mr. Shepherd was a member built 7,026 miles of railroad. In 1882 his crews working on the Canadian Pacific built 675 miles of line in 15 months; in one day the crew covered 6 miles and 600 ft. Five years later Mr. Shepherd bettered this record, constructing 8 miles and 60 ft. of track in one day during the daylight hours. It is stated that an additional half mile of track would have been laid that day had not the cars used in hauling rails broken down. This record was made on the Great Northern system between Minot and Helena. The trackage between Minot and Helena of 643 miles was constructed in 7½ months. For a distance of 200 miles, from Milk River to Grant Falls, the grading progressed at the rate of seven miles a day. On this work the average force employed was 8,000 men and 6,600 horses on the grading and 650 men and 450 horses on the track laying, surfacing and timber work. The men were housed and boarded in 3-story box cars, built for the purpose, and so high that they had to be guyed with ropes during high winds to prevent their toppling over. How well the work was done is shown by the fact that the first trains over the line made the run at an average speed of 30 miles per hour, and reached a speed of 50 miles per hour part of the way. In April, 1887, Shepherd's firm became the contractor for the extension of the Great Northern system to the Pacific coast, and from that time until the close of 1893 did much work for that railway. In 1894 Mr. Shepherd retired at the age of 66.

A One-Man Railroad.

Hodgeman County, Kas., is to have a one-man railroad if truthful press reports are to be believed. It seems that about two years ago a man named Myers arrived in Jetmore, Kas., with four mules, a wagon and an ordinary scraper. He immediately announced his intention of building a railroad from Jetmore to Garden City, and began seeking leases and right of way He asked no bonuses, sought no free right of way, or offered no stock for sale, but quietly went on securing the necessary land. He is already said to have purchased four miles of right of way, paying $40 an acre, and has also leased other land for the right of way. The distance between Jetmore and Garden City is 54 miles, and Myers set about building all of this line himself. With his four mules and the scraper he began constructing the road bed and is now said to have over 1½ miles of it graded and surfaced ready for ties and rails. All that his neighbors have been able to worm out of him is that he is building the line as he can in the belief that some time a big railroad will come along and buy his right of way and grades. He wants to get the grade started and is purchasing and leasing right of way as he goes along. It should be added that he expects to find a purchaser before the line is finished.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

CALIFORNIA.

We are advised that the Sacramento & Sierra Ry. is at present doing some grading by day labor, but has no present intention of letting any contract soon. J. M. Graham, 5th and K Sts., Sacramento, Cal., is chief engineer.

Willett & Burr, 133 First St., San Francisco, have secured the contract for the construction of that portion of the Northwestern Pacific Ry. 10 miles northerly from Willits and about 16 miles southerly from Shiverly, leaving a gap of about 90 miles. Considerable of the work has been sublet, such as could be economically worked until the late spring. The country through which this road traverses is one where even for a wet country the rainfall is excessive. According to one rain gage during the preceding rainy season, which is about from the first of October to the last of April, 106 ins. of rain fell. Willett & Burr have sublet on the southerly end, or what is known northerly from Willits, portions of the work to Clark & Welles, the Damascus Railroad & Contracting Co., Graham, Nicholson & Arnold Co., and the Van Hees Contracting Co. On the northerly end it is more than likely that Willett & Burr will perform all of the work themselves. The work includes five tunnels, all in rock, and they will aggregate about 4,500 ft. There are about 16 bridges, one 65 ft. in height and one 45 ft., the others running from 25 to 30 ft. in height, all to be of steel or concrete piers with concrete abutments. There will be about a dozen ballasted trestles. The amount of masonry has not been definitely settled, and as the country through which the road traverses is a deep, narrow ravine, with high, precipitous sides, the amount of yardage to be removed will depend on how the slopes stand. It is hoped to finish this work by the latter part of next fall.

ILLINOIS.

The Springfield & Jacksonville Interurban Ry. Co. has completed surveys for the first 33-mile section of its projected 102-mile line and contracts for this section have been let. O. J. Lucas, Latham, Ill., is president and T. S. Davy, Springfield, Ill., is chief engineer.

IOWA.

The Atlantic Northern & Southern Ry. Co. has raised 50 per cent of the actual cost of the road in the cities along the route. The company now wants to exchange first mortgage bonds for material, grading, etc., for the balance. H. S. Rattenborg, Atlantic, Ia., is president.

KANSAS.

The Central Kansas Interurban Ry. Co., recently organized at Abilene, Kan., projects the construction of an 80 mile line, passing through Newton, Canton, Roxberry, Gypsum City, Abilene and Salina. O. Moorshead, Newton, Kan., is chief engineer, John C. Nicholson, Newton, Kan., is president and C. B. Kirtland, Salina, Kan., is treasurer.

The Kansas City, Lawrence & Topeka Ry. has completed surveys for its projected 55-mile electric railway. The capital for the construction of the line has not been secured as yet and date for awarding contracts has not been decided upon. The line is to extend from Monrovia to Lawrence, Kan., passing through De Soto and Eudora, Kan. James G. Hughes is chief engineer, and Willard E. Winner, 424 Realto Bldg., St. Louis, Mo., is president.

MISSOURI.

The Mexico, Santa Fe & Perry Traction Co. has completed surveys for the construction of its 100 mile line from Mexico, Mo., to Fulton, Mo., and Columbia and from Mexico via Perry to Hannibal. The contract has been let to Burns & Co., 705 Isabella Bldg., Chicago, Ill. M. Crum, Mexico, Mo., is president of the traction company.

NEBRASKA.

The Nebraska Traction & Power Co. has awarded a general contract to the General Construction Co., Omaha, Neb., for constructing a 3½-mile extension from its present terminal at Ralston. The General Construction Co. will sublet the grading and bridging. The extension is to be built partly over private right of way and partly over highways. B. H. Oliver, Box 1057, Omaha, Neb., is chief engineer, and Mel Uhl, 17th and Jackson Sts., Omaha, Neb., is president.

NEW YORK.

The Rockland R. R. has completed surveys and has secured the capital for the construction of its projected 50-mile electric railway. Construction contracts are to be let within three months. The road is to extend from Englewood, N. J., through Nyack to Haverstraw, N. Y., and is to have a branch to Suffern, N. Y. B. A. Hegeman, Jr., 165 Broadway, New York, is president, and W. H. Coverdale & Co., 66 Broadway, New York, are the engineers.

NORTH CAROLINA.

The North Carolina Traction Co. has completed surveys for its projected 80 miles line and will let contracts within two months. The road is to extend from Winston-Salem, N. C., to Stuart, Va., and its construction will involve the erection of three bridges—one 100 ft. long and two 80 ft. long. E. Hillman, Aberdeen, N. C., is president and Dr. H. P. MacKnight, South Paris, N. C., is chief engineer.

OHIO.

The Cincinnati, Portsmouth, Pomeroy & Pittsburg Traction Co. has partially completed surveys for its projected electric line. Capital for the construction has been secured and contracts will be let in the early spring. The projected length of this road is 438 miles and it is to extend from Cincinnati, O., to Pittsburg, Pa., the route being along the Ohio River. A. E. Cox, Huntington, W. Va., is president, and C. Parsons Sanborn, Huntington, W. Va., is chief engineer. A. M. Frick, Portsmouth, O., is also interested.

OREGON.

We are advised that the Oregon Electric Ry. Co. has not as yet made any definite plans for future extensions. It was reported that the company plans to build about 50 miles of track work this year. G. W. Talbot, Portland, Ore., is vice president and general manager.

The Oregon Eastern Ry. has completed surveys for its projected 287 mile line from Vale, Malheur County, Oregon, to Odell, Klamath County, Oregon. The capital for the construction of the line has not been secured as yet and date for awarding contracts is indefinite. This is an Oregon Short Line project. C. G. Sutherland, Portland, Ore., is president and Geo. W. Boschke, Portland, Ore., is chief engineer.

PENNSYLVANIA.

The Buffalo, Rochester & Pittsburg Ry., E. F. Robinson, chief engineer, Rochester, N. Y., will soon commence the construction of a storage reservoir, with earth fill dam and concrete core wall, on Kyle Run, near Du Bois, Pa., for the purpose of furnishing the Du Bois terminal with a continuous gravity supply of pure boiler water. The dam will be 35 ft. in height, 1,000 ft. in length, and the reservoir will have a capacity of 500,000,000 gals. The feed line will be 12-in. cast iron pipe, four miles in length. The railroad has just completed a similar reservoir, with a capacity of 100,000,000 gals., for supplying the engine terminal at Punxsutawney, Pa., with pure boiler water.

The Buffalo, Rochester & Pittsburg Ry., E. F. Robinson, chief engineer, Rochester, N. Y., has closed a contract with the Miller Construction Co., of Lock Haven, Pa., covering grading for nine miles of double track, grade and line revision between Newton, Pa., and Mt. Jewett, Pa. This improvement involves very heavy work, costing approximately $800,000.00, and will eliminate the last link of single track in the main line between Ashford, N. Y., and Punxsutawney, Pa.

The James McGraw Construction Co., Arcade Bldg., Philadelphia, has been awarded the contract for the new Pennsylvania R. R. line through Bristol, Pa. As stated in our last issue the work will include nine bridges to be built over streets and public roads, one bridge to be built over the Pennsylvania Canal, and three over streams. To do this will require the grading of 550,000 cu. yds. of earth, the building of 5,000 cu. yds. of arch masonry, and 12,000 cu. yds. of bridge masonry. All the bridges will be built of concrete and they will be reinforced over all streets to provide solid floors for tracks.

WASHINGTON.

The Mount Adams Electric R. R. Co. has partly completed its preliminary surveys for its projected 60 mile line via White Salmon, Snowden and Glenwood, Wash., and possibly may let contracts by May 1. C. L. Colburn, White Salmon, Wash., is acting president and H. S. Hall, White Salmon, is engineer in charge.

WISCONSIN.

At a mass meeting of farmers and business men held Dec. 29 at Prairie Farm, Wis., a corporation was organized for the purpose of constructing and operating a railroad from Prairie Farm, Wis., to a point on the Chicago division of the Soo between Downing, Dunn County, Wis., and Emerald, St. Croix County, Wis. In less than one hour $25,000 was subscribed. The directors chosen for the ensuing years are G. E. Scott, W. A. Reque, J. DeWilde, J. M. Rassbach, R. A. Cleveland, C. B. Thatcher and A. A. Hovda. The officers elected are as follows: G. E. Scott, Prairie Farm, president; C. B. Thatcher, vice president; J. DeWilde, secretary and treasurer.

Power Developments, Levees, Drainage and Irrigation Works.

COLORADO.

Bids are asked by the Holbrook Irrigation District, J. E. Lewis, secretary, La Junta, Colo., until 11 a. m., Jan. 10, for building dam, outlet ditch and all structures to fully complete Reservoir No. 1 of the district. Bids are also asked for building dam, outlet tunnel or conduit, outlet gates and outlet ditch to the

Over 40 years building Contractors' Tents, Tarpaulins and Canvas Goods of Every Kind

Stable Tent **30 x 49** 10 oz. army duck, roped on ridge, eaves, across bottom of gables and every seven feet over top with 6 foot detachable 10 oz. S. F. walls and poles for **$160.00** net. First-class in every respect. Other sizes and weights in same proportion. *Write for Catalogue.*

MORRISON TENT & AWNING CO., 115-117 OLIVE STREET ST. LOUIS, MO.

Arkansas River, as well as all structures necessary to fully complete the Dye Reservoir. Plans, etc., are on file at the office of J. E. Lewis, at La Junta. The official advertisement for this work will be found elsewhere in this issue.

ILLINOIS.

The commissioners of the Eldred Drainage and Levee District will receive bids until 2 p. m., Jan. 20, at Carrollton, Ill., for the construction of a levee containing 1,492,759 cu. yds., a muck ditch requiring 42,220 cu. yds. excavation and a drainage ditch requiring 192,730 cu. yds. excavation. The work is divided into nine sections and bids will be considered upon each section or collectively. The Harman Engineering Co., Peoria, Ill., is the engineer. Plans, etc., are on file at the office of the county clerk at Carrollton, at the office of the Harman Engineering Co. and at the office of Boyle, Mott & Haight, 218 La Salle St., Chicago, Ill. The official advertisement will be found elsewhere in this issue.

IOWA.

G. A. McWilliams, Walnut, Ill., has been awarded the contract for constructing the Knox Ditch, near Hamburg, Fremont County, Ia., for the Knox Drainage District. The contract price was 5.89 cts. per cu. yd. and the work includes the cutting of a new ditch about 12 miles long with a bottom width of 34 and 40 ft. The estimated amount of excavation is 807,600 cu. yds. Above is dredge work; bids for it were opened Dec. 30.

NEW YORK.

Henry Du Bois' Sons Co., 17 State St., New York city, was the low bidder Dec. 30, at 13¾ cts. per cu. yd., for dredging in the North River for the borough of Manhattan. The work includes dredging about 200,000 cu. yds. mud, etc.

The Board of Water Supply of New York city on Dec. 24 awarded Contract 53 for the construction of Grassy Sprain cut and cover, Platt Ave. siphon and portions of Ardsley cut and cover, bids for which were opened on Dec. 16, to the Elmore & Hamilton Contracting Co., Tweddle Bldg., Albany, N. Y.

The State Superintendent of Public Works, Albany, N. Y., has awarded the following barge canal contracts, bids for which were opened Dec. 28: Contract 33, for constructing lock gates, needle beams, guard and sluice gates at various points on the new canal, Penn Bridge Co., Beaver Falls, Pa., $199,640; contract 44, for constructing a little over seven miles of canal just west of Rome, Scott Bros., Baldwinsville, N. Y., $1,748,679; contract 70, for dredging the channel of the Hudson river from Waterford northerly, a distance of 3½ miles, Shanley-Morrissey, Inc., 527 Fifth Ave. New York city, $779,636.

TEXAS.

The Beaumont Navigation District has voted $498,000 in bonds and the bonds have been approved by the attorney general for the purpose of opening the Sabine-Neches channel to a depth of 25 ft. These bonds have not yet been sold, it being the present intention of the commissioners to await an additional appropriation from the present congress. It is therefore not likely that any contract will be attempted until probably August or September. Jas. F. Weed, Beaumont, Tex., is the engineer.

The town council of Piedmont, W. Va., has voted to extend the franchise granted to the Potomac Valley Ry. The company laid a short piece of track about a year ago in the town.

The Ponemale Co., manufacturer of cotton goods, of Norwich, Conn., has begun work on the reservoir which it is to build at Taftville. The dam will have a length of 300 ft. and a height of 34 ft., with a core of concrete, and the reservoir will have a storage capacity of 50,000,000 gallons.

A route is being laid out for the projected line of the Hudson, Center & New Salem Electric Ry. The proposed line is to parallel at some distance the extension the Northern Pacific is building north from Mandan, N. D. It is planned to build a large power house at Center, N. D., and make the place a division point.

Surveys have been started for the Clarksdale & Mississippi River R. R., which projects a line from Clarksville, Miss., to Friars Point. The necessary capital for building the road has been secured. H. T. Adams, Memphis, Tenn., is chief engineer.

Plans are stated to have been decided upon by the Pennsylvania R. R. for a new branch line to extend from Newark to Harrison, N. J. It is said that the tracks from Harrison to Jersey City will be electrified, and direct track connection made with the Hudson and Manhattan railroad in Jersey City. The construction and electrification of this new line will provide a new electric train service from Newark into Jersey City and a direct route into the Church and Courtlandt St. (New York) terminals of the Hudson & Manhattan R. R.

A resolution has been before the city council of Phœnix, Ariz., instructing the city attorney to take steps toward obtaining permission from Congress for the city to bond itself for $300,000 for the construction of a municipal lighting plant.

The city council of Paris, Ky., has granted a 20 year franchise to the Paris & Cynthiana interurban electric railroad for building and operating an electric line between these points. Work is to begin immediately, it is said.

The National Railways of Mexico, James M. Reid, chief engineer, city of Mexico, has awarded the contract for the Pasedon cut off to E. M. Griffith. The cut off will be six kilometers in length and is built primarily to reduce operating expenses, affording a short haul from the coal fields tributary to the Mexican International to Monterey and thence to Saltillo and Mexico.

Provision has been made by Col. Lansing H. Beach, U. S. engineer, New Orleans, La., to lease a dredge boat to replace the one which burned last June, and work will be rushed vigorously in carrying on the dredging in connection with the work of digging the intercoastal canal. Thus far nearly all the digging has been done in Louisiana, under the personal direction of Colonel Beach, who has been assisted by Lieutenant R. R. Ralstow. With regard to the progress made in Louisiana in the digging of the intercoastal canal, it is reported that five miles have already been cut through from the western end of Vermillion bay to Schooner bayou. The engineers are now at work digging through the marsh. Thus far they have dug about 1,500 ft. through the marsh and will continue to dig until White lake is reached. The engineers are now preparing to take up the digging in another section; that is, beginning at Grand lake and working east to Vermillion bay, the connecting point. It is expected that the new dip dredge now being built at Mermentau will be ready for use by the first of the year.

The National Government of Mexico is stated to have plans in preparation for harbor improvements at Tuxpam, Mexico, including deepening of the entrance at the bar and the building of new wharf and warehouse. This work is to begin early in 1910.

Andy Scott, of Douglas, Ariz., is working an outfit near Sasco, Ariz., on work for the Santa Cruz Reservoir Co. This company has built more than 200 miles of irrigating canals and laterals have been run throughout the immense acreage acquired by the company and many more miles of such canals will be laid before the work is completed. The reservoir, when completed, will have a capacity of 190,000 cu. ft.

The Atlantic Coast Line Ry. Co. has decided to construct a line from Wadesboro to Charlotte, N. C., and surveys are to be started at once. E. B. Pleasants, Wilmington, N. C., is chief engineer of the company.

The Atlantic City Co. has been incorporated in Delaware with a capital stock of $6,000,000 to manufacture and deal in gas and electricity. It is believed in Atlantic City, N. J., that the incorporators of the company are Clarence Giest and other Philadelphians who recently purchased and merged the Atlantic City Water Co. and the Consumers' Gas & Fuel Co. of Atlantic City.

Advices from Missoula, Mont., state that C. F. Allen, district engineer of the Blackfoot Ry. Co., has a large force of men at work clearing the right of way so that grading and rock blasting can be started at once. The contract for constructing two bridges over the Blackfoot River for the railway has been let to O. E. Peppard, Missoula, Mont.

The Mexican government has agreed to spend $6,000,000 and a Mexican capitalist $4,000,000 on irrigation projects in northern Mexico along the line of the International road. Millions of acres there will be transferred into truck beds.

The Vera Cruz & Isthmus R. R., Thos. Milan president, Vera Cruz, V. C., Mexico, is stated to have let the contract for the construction of a branch line from Tierra Blanca to San Andres Tuxta, a distance of about 60 miles. The route is through a rich agricultural section of southeastern Mexico.

The Vancouver Island Power Co., Ltd., of Vancouver, B. C., has applied for permission to build a dam and storage reservoir on Bear Creek and Alligator Creek, tributaries to the Jordan River.

Davis, Marshall & Macneill, attorneys, Victoria, B. C., have applied for incorporation for a company to build a proposed line commencing near where the Salmon River crosses the international boundary line between British Columbia and Alaska, thence following the Salmon River to its source.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Alabama Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Land agents of the Southern Ry. are reported to be securing a right of way between Birmingham and Parrish, Walker county, for a new line that will be constructed within the next six months. The purpose of the new line is to facilitate business between the coal fields to Birmingham, and to ultimately supplant the roadway which is now arranged over the line of the Western Alabama.

The Birmingham Railway, Light & Power Co. of Birmingham, which is now laying its tracks on 19th St. at Bessemer, is said to have asked the city council of that city for a franchise to run a car line on 20th St. from 1st Ave. to 4th Ave.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Fort Smith & Van Buren Interurban Light & Traction Co. has been organized at Van Buren with a capital stock of $100,000 and proposes to build a traction line through Crawford, Franklin, Johnson, Madison, Newton, Boone and Searcy counties. T. A. Bayley, C. E., is one of the principal promoters of the company and has already made the preliminary surveys from Van Buren to Mulberry. He has secured seven miles of the right of way, beginning at the eastern limits of Van Buren and he anticipates no trouble in securing the right of way through Crawford County. The officers of the company are as follows: W. F. Keller, president; L. W. Burgett, vice president; T. A. Bayley, secretary; S. A. Pernot, treasurer; and S. R. Chew, attorney. The other incorporators are J. L. Rea, W. F. Blocker of Fort Smith, Frank Woclum, L. F. Sherwood, R. A. Clarkson of Fort Smith, Henry Kibler, J. H. Keller, John Kibler, J. W. Keller and N. E. Waite.

Roach & Stansell, Memphis, Tenn., have been awarded the contract by Maj. M. L. Walker, U. S. Engineers, for building 61,000 cu. yds. of levee near Wilson, Ark., in the St. Francis Basin. This levee will be a very difficult one to build, according to engineers who have gone over the country through which it will go. Before the levee can be started, the land will have to be cleared, which is through a dense swamp. The contractors have one year in which to complete the work.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Los Angeles Ry. Co. of Los Angeles is to construct an extension of the West Adams car line between Arlington and West Adams, the present terminus, and Eleventh Ave. and West Adams St. The extension will be two-thirds of a mile long.

The Southern Pacific Co. has placed an order with the Folsom Rock Co. of Folsom for 200,000 tons of crushed rock to be used for ballast on the Sacramento division.

The Southern Pacific Co. has applied to the city council of Alameda for a franchise for a line running from the High St. bridge across the Cohen property to the new loop right of way. If the company is given this franchise it will be enabled to run electric trains from Melrose and adjacent territory to the Alameda mole, via Lincoln Ave.

The San Jose Railroads Co. has been incorporated with a capital stock of $5,000,000 for the purpose of taking over the First St. railway line in San Jose and operating it in connection with the Santa Clara St. line. The company also proposes to construct other local lines. The men interested are L. E. Hanchett, president; W. R. Lawson, manager, and E. M. Rea, secretary and attorney of the Santa Clara St. line, and F. E. Fitzpatrick, who is associated with John Martin of San Francisco.

The Southern Pacific Ry., W. Hood chief engineer, San Francisco, is planning to relay its track between Bakersfield and Mohave with 90 lb. steel at an approximate cost of $300,000. Another improvement will be the relaying with 90 lb. rails of the Imperial valley branch, a trifle over 40 miles, reballasting, reconstruction of bridges and other improvements, at an expenditure of $450,000.

The Feather River Dredging Co. has been organized at Kingman, Ariz., with offices at Pueblo and Denver, Colo. The company has been incorporated in Arizona with a capital stock of $2,500,000 for the purpose of dredging 24 miles of the channel of the Feather River from Yuba City to a point below Nicolaus. The company will extract the gold contained in the sand and gravel of the river bed and deposit the sand along the banks of the river for levees or for filling the low lands, doing this under an arrangement with the reclamation districts along the river. These operations will remove a large amount of debris that now choke the channel of the river, and will make it navigable, at the same time permanently reclaiming many thousands of acres of agricultural lands. The incorporators are George S. Cowdery, M. R. Carpenter and W. H. Cole. They have filed placer mining claims along the river where they intend to operate. Several suction dredges will be employed in the dredging operations.

E. E. Shafer, Los Angeles, has been awarded the contract for constructing the Newhall tunnel for the county supervisors, the contract price being $63,364. The tunnel arch is to be lined with concrete.

A hearing was held Dec. 28 at the U. S. engineer's office in Los Angeles on the petition of the Pacific Electric Co., for permission to build a bridge across Los Cerritos slough for a line from Long Beach to San Pedro by way of Wilmington.

The Southern Pacific Co. is stated to have awarded the contract for grading for the extension of the 7th St. line at Melrose to San Leandro, via Melrose Heights. It is believed that though the road will be built for electric trains a steam service will first be used until the electrization of the suburban lines is completed.

Final arrangements are reported to have been made for the proposed Fresno-Hanford interurban line and it is believed that actual construction work will be started early this month. The project has been promoted by F. S. Granger of Fresno as previously noted in this paper. W. G. Luce, Chicago, Ill., is reported to be interested.

Surveyors for the Southern Pacific Co. have established headquarters at Redding, and have begun surveys for the Pit River branch of the Goose Lake Southern. This road is to connect Alturas, Klamath Falls and other points in the Pit River territory with Redding or some other point on the main line in Shasta County.

It is believed here in San Bernardino that the Western Pacific Ry. is planning to begin construction work on its line through San Bernardino. It is said that the contract for the work has already been let to the Western Construction Co., of Los Angeles.

Work on the Sacramento-Sierra R. R., now building a line from Sacramento to Lake Tahoe by way of Georgetown, is to be continued all the winter. Work has been stopped temporarily in the adobe soil in the valley lands, because it is impossible to work in that kind of soil in winter. In districts where the soil is such that it can be worked no stop will be made. In some of the hilly districts much more progress can be made in winter than in summer because the soil can be more easily handled when it is wet. Large forces of men have been at work clearing the right of way above Orangevale Bluffs, where grading will begin in January.

Work has been started at Walnut Creek near Oakland on the new electric railway in Contra Costa County in order to hold the franchise. It is stated, however, that more men will be put at work shortly and the line finished within a year or so. The line is ultimately to connect Oakland with Walnut Creek, Martinez, Antioch, all the towns and villages of the San Ramon valley and the growing electric system of the San Joaquin country. The first section of the road that will be built will be that connecting Oakland, through the tunnel under the range in the Claremont district with the Walnut Creek section. A. W. Maltby and R. L. Napthali have the franchise.

Grant Bros. Construction Co., Trust Bldg., Los Angeles, Cal., has been awarded the contract for grading the line of the Phoenix & Eastern R. R. from Winkelman to San Carlos, Ariz. The work includes the boring of two 1,800-ft. tunnels through solid rock which will require about one year's time.

Construction work will probably be started this month on an extension of the Holton Interuban R. R. from El Centro westerly to New River. It is believed that this extension will form the valley end of the San Diego and Arizona railroad, now building from San Diego. This road is not expected to get into Imperial Valley for eight months or a year, and in the meantime it is the general supposition that the extensions now planned from El Centro will be operated as a portion of the railroad controlled by the W. F. Holt interests.

The Southern California Edison Co. has filed with the county clerk at San Bernardino a $30,000,000 trust deed, which represents a general mortgage on all the company's property in California secured by 5 per cent 30-year gold bonds dated November 1, 1909. The company is to use the money to carry out extensive improvements.

The Southern Pacific has made plans for the extensive improvement to its railroad property at El Centro.

William Williamson, a subcontractor on the Parker cut off, who shot and killed Dan O'Donnell, has been acquitted as far as the coroner's jury is concerned. The jury which investigated the shooting found that William son had shot in self defense.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The recent inspection of the Denver, North western & Pacific Ry. by J. B. Berry, chief engineer of the Rock Island, has given rise to the report in this city that the latter road has furnished the necessary financial backing so that the D., N. & P. Ry. can be built to Salt Lake City next year. It is said that the line will be built over the original survey entering Salt Lake City by way of Provo. It is further said that construction work will be started early in the spring. The Denver, Northwestern & Pacific is now completed to a point several miles beyond Steamboat Springs, Colo. The route is over exceedingly rough country, making the cost of construction much more than it was at first estimated. The survey for the road runs in a line almost directly west from Denver to Provo, Utah. The line goes over the mountains where possible, but the higher points are crossed by means of tunnels. H. A. Sumner, Denver, Colo., is chief engineer.

The Kiowa Reservoir & Irrigation Co. has sold a bond issue of $801,000 and is said to be planning to have work started in the spring on its irrigation project, covering 20,000 acres in Kiowa and Arapahoe counties. The land in the project lies south and east of Denver, and will be irrigated by three large reservoirs, to

CONTRACTORS' TENTS
PLAIN DUCK WATERPROOFED DUCK

Our waterproofing and mildewproofing process is the best known. We do this work ourselves and consequently are in a position to name bottom prices. Our workmanship and materials are not excelled. We offer you QUICK SERVICE. BEST TENTS MADE.

THE COLUMBUS TENT & AWNING COMPANY, Columbus, Ohio

contain a total of 51,074.8 acre feet. Senator C. D. Griffith, Lee S. Reynolds, H. S. Covey, Arthur Keenan and E. W. Jackson are the promoters. E. W. Jackson, Chicago, Ill., is the engineer.

The Silverton Northern R. R., which operates a 15-mile line in Colorado, is making surveys for an extension from Animas forks to Mineral point, about four miles. J. P. Pitcher, Jr., Silverton, Colo., is general manager.

The Nevada United Mines Co., Denver, Colo., has completed plans for building 18 miles of railroad to connect its mine at Ward, Nev., with the Nevada Northern R. R., near Ely, Nev.

The stockholders of the Juana Justo Power & Electric Co., at a meeting at Colorado Springs, took action on increasing the capital stock from $3,000,000 to $5,000,000. The company plans extensive additions to its equipment and big development work for the new year. Leonard E. Curtis and Henry Hine of the Central Colorado Power Co. are leading stockholders of the company, which has large holdings at Guana Juato, Mexico.

According to reports from Grand Junction the Denver & Rio Grande railroad is making a survey from Cisco into the Paradox country. The route taken by the surveyors is directly southeast from Cisco to the Rio Dolores River and then follows the river to Hydraulic and on to Bedrock. From that point the proposed line is to extend to Naturia and Norwood and connect with the Rio Grande Southern at Placerville. It is said that this route offers a 1 per cent grade into the Paradox valley, as against a 3 per cent grade by the way of Unaweep. The plan of the Rio Grande, it is said, is to run a direct train connection between Grand Junction and the Paradox, the trains leaving the main line near Cisco. The survey has been pushed to the Dolores River and will go on as fast as possible.

Dr. J. A. Lewis, former mayor of Manitou, has filed on all unappropriated water rights on West Sutherland creek, a mile and a half west of Colorado City, and with associates has started preliminary work on three reservoirs capable of developing 15,000 hp. They will invest $125,000 and plan to eventually furnish Colorado City with water and power.

J. C. Ford, of Lamar, has a subcontract on the Two-Buttes Canal work, his contract being mostly rock work.

Dr. Newton N. Brumbach, of Colorado Springs, president of the Manitou Incline Ry. Co., has completed the purchase of a tract of 160 acres, adjoining the forest reserve on Pike's peak, in order to perfect the title to his right-of-way. The consideration was $3,000.

The Colorado Railway, Light & Power Co. has filed articles of incorporation with the county clerk at Pueblo. The company will operate in Denver, Huerfano, Las Anamas, Fremont and Pueblo counties and has a capitalization of $5,000,000. The new company is the successor to the Southern Power Co., which will go out of existence this month. It will take over the power plant at Trinidad and will enlarge it.

The Whedbee St. extension of the Fort Collins electric line was put in operation on Dec. 23. The line is a mile in length, running from the center of the city to the limits on the southeast. The Denver & Interurban, a company controlled by the Colorado & Southern, now has seven miles of line in operation at Fort Collins.

P. J. Franklin of Colorado Springs will shortly have construction work started on an irrigation system to water 23,000 acres of land in the Santa Fe valley, 12 miles west of Santa Fe, N. M. The company in which Mr. Franklin is interested secured control of 3,200 acres and the remaining tract adjoins. The main canal of the irrigation will carry water from the Santa Fe River and several laterals have been completed.

The Guanajuato Power & Electric Co., Giddings Bldg., Colorado Springs, Colo., has ratified plans involving the expenditure of something over a million dollars. According to Henry Hine, president of the company, the increase in the capital stock from $3,500,000 to $5,000,000 will be used in taking over numerous electric, power and light concerns in Mexico, and in greatly enlarging the present extensive system of the company in the state of Guanajuato.

The plant, franchises, etc., of the Southern Colorado Light & Power Co., has been sold to the Northern Securities Co. of Denver for the Colorado Light & Power Co. for $50,000. The new company is financed by Brown Bros. of New York and they plan improving the plant to supply power to many mines in southern Colorado and northern New Mexico. It is planned to increase the capacity from 1,500 to 15,000 hp.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The engineers of the Northern Pacific Ry., who have been at work on the Missoula cutoff, are now said to be concentrating their work on the survey of a tunnel at Kooskia. The tunnel will pierce the hill near Kooskia and afford a more convenient entrance from the middle fork to the main stream at the junction. It is reported that the cutoff survey will be abandoned and a three mile tunnel driven, which will reduce the elevation of the summit climb 500 ft. at the divide.

The Pacific & Idaho Northern Ry. is said to be making good progress with its plans for extending its line from Evergreen to the heavy timber belt. E. M. Heigho, Weiser, Idaho, is general manager.

Grading work on the Aberdeen-Moreland branch of the Oregon Short Line R. R. in Idaho has been completed and eight miles of street have been laid. The branch, which will be 29 miles long, leaves the Mackay branch at Moreland, about 9 miles from Blackfoot. The line will end at Aberdeen, but it is believed that in the spring surveys will be made west from that town to Minidoka.

The Northwestern Lumber Co. has completed surveys for its projected 12 mile line from Vollmer, Idaho, to Forest, Idaho, and is planning to commence construction work in the spring. Ties and bridge timber are to be cut this winter. The maximum grade according to the survey of W. P. Wood, chief engineer, is 1½ per cent.

The Boise Valley Electric Ry. of Boise is planning to begin active construction work in the spring on the loop connecting the South Basin and Morris Hill cemetary branches. Robert Noble is president.

The Northern Pacific engineers have completed the revision work on the survey from Kooskia to the summit of the Bitter Root mountains and the last of the parties returned to Kooskia Dec. 20. During the past 10 months the Northern Pacific has maintained an average force of 200 men on the survey between Kooskia and Lolo Junction and every feature of the engineering work is now in readiness for the contractors. During the past four months the railroad company has expended a large sum of money in the construction of a trail up the middle fork, and with the surveying work practically completed at that time this work can only be construed as being preparations for construction camps. W. L. Darling, St. Paul, Minn., is chief engineer.

The Idaho & Western Ry. Co. has been incorporated at Couer d'Alene as a subsidiary company of the Chicago, Milwaukee & Puget Sound Ry., to construct the latter company's branch from Plumer, Idaho, to Spokane. The principal place of business is Coeur d'Alene and the road will consist of 75 miles, from a point near Plummer to Spokane, with a stub into Coeur d'Alene. Surveys for this road are practically completed and options have been secured through Coeur d'Alene from the "made" ground in front of the Hotel Idaho to the northern limits of the city. The road will run along the west side of the lake to Mica bay, thence through the Coeur d'Alene reservation to Plummer. From Coeur d'Alene the road will follow down the Spokane river, paralleling the electric line. The capital stock, aggregating $3,000,000, is all held by the Chicago, Milwaukee & Puget Sound Railroad Company excepting one share each by J. L. McLear of Coeur d'Alene, E. D. Sewell, H. R. Williams, E. W. Coole and H. H. Fields, all of Seattle.

Advices from Grangeville state that the Hummer Mining & Milling Co., which owns property about 3,000 ft. north of the town of Calendar, has made arrangements for starting work on the claims. Work will shortly begin on a tunnel which is to be driven 3000 ft. and will tap the main ledge at a depth of approximately 1700 ft. Six other ledges will be cut by this tunnel.

Location work for the new Harriman line to connect with the Illinois Central at Sioux City, Ia., has been made 180 miles west of that point, west to Bijou Hills in South Dakota. The line is to be extended to Pocatello, Idaho, where it strikes the Oregon Short Line, and to Idaho Falls. It will be a connecting link which will give the Harriman system a northern through route from Chicago to Seattle; also to Salt Lake City and San Francisco. The new line is through a fertile country, largely devoted to cattle and sheep raising. In many places it will be 150 miles from any other railroad. The location work has been under way for five months and will be rapidly pushed as soon as the engineers find the weather again endurable up there. It is expected that the line will be completed in about two years. Capt. C. J. Dubois, Macon, Mo., is chief locating engineer.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Galesburg & Rock Island Traction Co of Rock Island, which projects a 41-mile interurban line, has filed a mortgage and trust deed for $1,500,000 at Aledo. This gives some color to the report that construction work is to be begun on the line next spring. The line will pass through Knox, Warren, Mercer and Rock Island counties and will touch Alexis, Viola and Preemption, and enter Rock Island over the proposed belt line in that city.

The People's Traction Co. is said to be planning to begin work in the spring on its interurban line from Galva to Galesburg. L. T. Edwards is chief promoter.

John Murphy, Eldorado, Ill., is promoting the construction of an electric railway to connect Marion, Eldorado and New Haven, Ill., with Mt. Vernon, Ind., and Evansville.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Winona Interurban Ry. Co. has just leased the Winona & Warsaw Traction Co.'s line for a term of ninety-nine years the lease taking effect on Jan. 1. The new line, which is operated between Warsaw and Winona, will be used as a separate division.

The Kokomo Western Traction Co. has been incorporated with a capital stock of $10,000 and proposes to maintain a street car line in Kokomo connecting with an interurban line from that city to Young America and to points in Carroll county. O. C. Guard, Young America, is one of the incorporators.

The project to build a traction line from New Castle to Richmond via Hagerstown has been revived. John M. Lontz, a manufacturer of Richmond, and who was one of the promoters of the line between Indianapolis and Richmond, has become interested in the proposed line. It is said that work will begin in the spring. The route has been surveyed several times

The Winona Interurban Co. is rushing its construction work so as to complete its line through from Mentone to Peru by Feb. 1. A large quantity of steel has been received for the line and two additional steam shovels have been placed at work.

The Logansport-South Bend Traction Co. has been granted a franchise at South Bend. The cars will enter that city over the Chicago, South Bend & Northern traction line.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city of Clarinda has voted a 5 per cent tax to aid the projected Iowa & Southwestern Ry. This makes it probable that work on the new road will begin not later than April 1 next and the line from Clarinda through College Springs to Blanchard will be completed and cars running thereon by Dec. 21, 1911.

F. J. Cross, Monticello, Ia., is reported to have been awarded the contract for constructing the Davenport & Manchester Interurban Co.'s line from Manchester to Davenport.

Messrs. Smith and Johnston of the Leon Electric Co. of Leon, Ia., are promoting a project for building an electric railway in that city from the C., B. & Q. depot to the business section of the city and from there to be extended as needed.

The Chicago & Northwestern Ry. is planning a number of improvements at Belle Plaine for this spring. The proposed improvements, which may be begun as soon as the frost is out of the ground in the spring, include about ten or twelve miles more of side tracks, for which land has been bought; a new and enlarged pumping station at Salt creek to replace the present pumping plant there, and with double its capacity, and a new round house near the "Y" to the south yards.

The Iowa & Illinois R. R. of Clinton, Ia., has been incorporated with a capital stock of $25,000, the incorporators being F. W. Ellis, G. E. Lamb and R. B. McCoy.

The directors of the Atlantic Northern & Southern Ry. have decided to ballast the entire line and reduce the present grade in a number of places. The work is estimated to require an expenditure of $20,000. C. B. Judd, Atlantic, Ia., is chief engineer.

The city council of Davenport has approved the ordinance granting a 25-year franchise to the Davenport Water Power Co. This will mean the securing to Davenport of an industry assuring the expenditure of at least $2,000,000 for a water power developing plant.

The city of Pocahontas will vote Jan. 14 on incurring an indebtedness of $14,000 for the construction of a lighting and heating plant.

Engineers of the Chicago, Milwaukee & St. Paul Ry. have started surveys over the Milwaukee east of Charles City with a view of relocating the road bed in some places along the line. The object of the survey is to level up several grades so that the Pacific coast traffic can be handled easier. With this end in view the hill at Doubleday is to be avoided.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Kansas Northwestern R. R., which projects a 300 mile line from the northern border of the state to Wichita, is reported to have financed the northern part of its line and is now proceeding to secure the necessary public subscriptions for the southern section. Great Bend and vicinity have raised $132,000 for the line and Hoisington has raised $50,000. The estimated cost of the road is $21,000 per mile. It is expected that work on the Great Bend end of the line will be commenced soon. E. W. Moses, Great Bend, Kan., is president.

The Wichita Terminal Association, which is controlled by the Santa Fe, Rock Island, Frisco and Missouri Pacific Rys., is to expend $168,000 in building new tracks, coal chutes, and the purchase of engines for its switching railway at Wichita.

The Interstate Construction Co. has been organized at Salina, Kan., for the purpose of building the Salina, Winnipeg & Gulf R. R. J. W. Wegner, Milwaukee, Wis., is president and H. J. Wilson, Chicago, Ill., is secretary.

Mount Pleasant, Elm Grove and Howard township, in Labette county, have voted bonds to the amount of $31,500 to take stock in the Kansas Union Traction Co., a corporation headed by William J. Jones of Labette county, which proposes to build an interurban railway from Parsons to Coffeyville, a distance of 35 miles passing through the townships which voted aid to it.

Practically all preliminaries have been completed for the Motor Grand Traction Co.'s line from Chester, Neb., to Wichita, Kas. As proposed the road will run from Chester to Wichita, connecting at Belleville, Concordia, Minneapolis, Salina, Canton, Newton and Wichita with all the east and west lines. E. S. Alnutt, Belleville, Kas., is the promoter.

The belt line railway company recently chartered to build a belt line at Wichita is said to be planning to go ahead with its project and build an entirely new set of tracks and switches to compete with the present belt line. The Cudahy Packing Co. is said to be the principal stockholder in the new company.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Duluth, South Shore & Atlantic Ry. has put in about 15 miles of new track during the present season, most of it in territory where much filling was required. The last jobs to be completed were the new tracks put in to Palmer and to the Davis and Milwaukee mines at Negaunee, and the filling of the hole caused by the cave-inat the Lake Angeline mine immediately east of the Oliver Iron Mining Company's Section 16 property.

The Michigan United Rys. has been granted the right to extend its lines on Saginaw, and Sheridan Sts., at Lansing.

Residents of Hope, Edenville and vicinity northeast of Midland are endeavoring to secure the construction of a railroad into the latter place.

The St. Joseph-Benton Harbor Interurban Ry., supposed to be headed for Paw Paw Lake and various other points not yet announced, has completed its line to the Watervliet road across from the old Teeter Hotel, Coloma, and is building a waiting room at this point. With this accomplished, construction work will probably be discontinued until spring.

It is believed that the Grand Trunk Ry. will complete its branch from the south to Kalamazoo by next summer, following which it is expected that active steps will be at once taken to continue the line to Grand Rapids, making the railroad a competing line with the Lake Shore, the G. R. & I. and the Pere Marquette between Grand Rapids and Chicago.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Minneapolis, St. Paul & Sault Ste. Marie Ry. is said to be considering building a branch line from Thief River Falls northward. No preliminary surveys have been made as yet, although steps have been taken to ascertain the topography of the country to be traversed. The line will pass east of Thief Lake and enter Roseau County near the west township line of Golden Valley and run northeasterly into Warroad.

A committee of the city council of Duluth has been in conference with the officials of the Canadian Northern Ry. Co. in an effort to prepare a franchise granting an ordinance covering the route which the company has selected through the residence section of West Duluth, which will protect the city's interests and at the same time be fair to the company.

The houses located on the Soo right of way in Bemidji are being vacated so that the contractors can begin the grading work in the residence portion of the city. John Moberg, Bemidji, has the grading contract.

The work of clearing the right of way and starting grading operations on the Soo railway east of Bemidji to Cass Lake and for some distance east towards the Leech Lake Dam is progressing very satisfactory. George Lydick of Cass Lake, who is clearing a considerable portion of the right of way, has contracted to clear 17 miles of the right of way east of Cass Lake and the 16 miles from Cass Lake to Bemidji. The latter part of December he had four miles of the right of way westward from Cass Lake ready for the shovels, and eight miles of the right of way had been cleared east of Cass Lake. Mr. Lydick has four crews at work on the clearing, and he is rushing the work as rapidly as possible. Richard Evans, Minneapolis, has two big steam shovels at work on the grade west of Cass Lake towards Bemidji, and the dirt is flying in big chunks over Cass Lake way. He states that the first 10 miles of the right of way from Cass Lake towards Bemidji furnishes the finest grounds to grade that he has ever worked on. F. J. Mann has a contract to grade 17 miles of the right of way east of Cass Lake.

St. Louis Items.

BY A. B. KOENIG.

The Illinois Traction System will not be able to complete the McKinley bridge at St. Louis and inaugurate service over the St. Louis, Venice, Granite City and Madison suburban lines until July. The bridge and the St. Louis lines were, according to ordinance, to be in commission by April, but General Manager H. E. Chubbuck is now convinced that the requirement cannot be fulfilled and he is preparing to request the municipal assembly for an extension of time. The installation of service on the McKinley lines and bridge at St. Louis is delayed by three causes. The commercial depression following the panic of 1907 affected the Illinois Traction Company to some extent and work did not progress as rapidly as had been planned. Weather conditions next interfered with operations. One of the worst obstacles, and this remains unsettled, was the opposition on the part of the Wabash and the Terminal Railroad Association to the building of the bridge approach over their tracks in St. Louis. Further delay will be caused by the present inclement weather, which will prohibit work on the superstructure of the bridge for at least several weeks and probably months. All arrangements for opening the bridge and line at St. Louis have been made. Coaches for the through service between St. Louis and Springfield, Peoria and Danville have been constructed. Pay as you enter cars for the suburban service between St. Louis, Venice, Granite City and Madison are nearing completion. Track laying on the local line from the McKinley bridge at Salisbury street to Twelfth street and Lucas avenue is done. Contracts have been awarded for the construction of a passenger station at Broadway and Salisbury street and plans have been drawn for a station at Twelfth, Thirteenth, Gay and Linden streets. Although the Illinois Traction System could if urged operate cars in St. Louis it will not be in position to open the McKinley bridge until July. And the suburban service between St. Louis and the Illinois suburbs cannot be inaugurated until the bridge is in commission.

CONTRACTORS!

Write us about our **Dry Duck Tents.** The real thing—**Water Proof** and **Mildew Proof.** The **Best** and only **Genuine Patented** process. The **Price** is right. The cheapest thing on the market.

BAKER & LOCKWOOD MFG. CO.. Kansas City. Mo

In all probability the St. Louis local line will not be put in operation until the bridge is opened. The report that Mr. Chubbuck would resign as general manager originated, it is believed, through his election as president of the Cairo-St. Louis and the Cairo local properties. Mr. Chubbuck will take charge of the Cairo project, but he will continue to act, for several years at least, as general manager of the Illinois Traction Company. Mr. Chubbuck said that extensions from Morris, Ill., to Joliet and from Streator to Bloomington will be completed at a comparatively early date next year. Then the Illinois Traction Company will have an interurban electric railway system between St. Louis and Chicago, as it has trackage rights from Joliet into Chicago. Another project, the Danville-Southeastern, has been launched by the Illinois Traction Company. Surveys have been made and considerable right of way secured for this new line, which will be constructed from Cairo northeast to Danville. Work is now in progress on the proposed line from Cairo to St. Louis. Operations on the Cairo-Danville and the Cairo-St. Louis lines will be carried on northwardly from Cairo. W. B. McKinley, president of the Illinois Traction Company, has a plan for the building of a line from Staunton eastwardly to Sullivan, Ind. Consideration of plans for the establishment of a Missouri traction system, based on a trunk line between St. Louis and Kansas City will be delayed until the work at St. Louis is done and the St. Louis-Chicago line is completed.

Pat Hickey spent the holidays here with his folks and returned to New York.

The warranty deed to the strip of ground on the Illinois side of the Mississippi River upon which the eastern pier of the municipal bridge is to be constructed, was received last Thursday by Comptroller Taussig, who paid the Southern Railway Company $100. Although there is a mortgage on the property the Southern Railway Company has guaranteed the transfer according to the city hall officials and there need be no alarm as to the right of the city to proceed with the work. Already the bridge builders are at work on the caisson, but it will not be sunk until the weather improves, as it would not be safe to mix the concrete before the frost has disappeared.

Opinions upholding the levee and drainage laws of Missouri, enacted in 1899 and amended in 1905, were given recently in the supreme court in Jefferson City. These opinions will now remove all obstructions towards the reclaiming of overflowed and swamp lands in the state. As long as the laws relating to the validity of such orders by county courts were in question as to their legality, many counties held back, awaiting a final decision by the supreme court.

Mike Tansey has finished his work on the Kansas City Southern R. R. and moved his outfit to Paris, Texas.

The Walsh-Kahl Construction Co. got in on several new pieces of steam shovel work on the Illinois division of the Iron Mountain R. R. last week.

List & Gifford report their work on the Illinois division on the Iron Mountain R. R. as getting along nicely. They will finish in a short time.

T. L. Smith secured a piece of Mulvill's work on the Rock Island R. R. at Villa Ridge. Smith will move onto this work as soon as he gets his job on the Santa Fe near Menocia, Ill., completed.

T. H. Nichols, who is going to superintend Lorrimer, Gallagher & Co.'s extensive sewer job in East St. Louis, is making preparations to begin work. Nichols says he is going to push this work for all it is worth and try and complete it in record time. Lorrimer, Gallagher & Co. have opened an office at 1417 Broadway, East St. Louis, Ill.

Preparations are already under way to begin anew the three months labor required to build the false work structure of the McKinley bridge, which was swept away, endangering the lives of a hundred men, by the rush of an ice pack down the river shortly after 4 p. m. Friday. As soon as the river has cleared sufficiently to make the resumption of the work free from danger, the rebuilding of the superstructure will begin. It took three months of hard labor and from $100,000 to $150,000 to bring the work to the stage it had reached. In fifteen minutes the result of this labor and financial expenditure was swept away. The work must necessarily be done again. Machinery valued at $25,000 went down into the river with the falling structure. It is possible some of this may be hoisted, but the probabilities are it will be a total loss. Seventy men were at work in the wooden structure and nearly 30 more were operating engines above them, when the creaking of the timbers told that the feared ice jam was sweeping down stream. The 70 men were rescued after a wild scramble to the tug Jos. Rogers, fixed in the ice near the bridge. The ones above clambered to safety on the steel structure. After the 70 men reached the tug their lives were still in danger and were saved only after a desperate battle with the ice by Capt. Jas. S. Short, master of the boat. The disaster was not wholly unexpected. For several days past the ice gorge above the bridge had extended as far south as North Market St., and north almost to the Chain of Rocks. Engineer F. E. Washburn, representing the McKinley system, known officially as the Illinois Traction Co., and J. J. Kelly, superintendent of the work, representing the Missouri Valley Bridge & Iron Co. of Leavenworth, Kan., the contractor, had been constantly on the watch, hoping against hope that the danger might pass, but fearing that the ice might move at any moment and crush the temporary structure to splinters. Both Washburn and Kelly were on the works directing the crew of 140 or more men employed and had just begun to feel that possibly the danger point had passed when the ominous rumble of moving slush ice portending disaster was heard. Seventy men were in the false work at the time. Twenty others were at work on its top, running a large traveling derrick, three "dinky" engines and a small traveling derrick. Alongside the false work, which is erected preliminary to putting the steel of the permanent bridge in place, lay the tug Jos. Rogers, a barge pile driver, a derrick barge and four other barges. Notwithstanding the tug as well as all the barges were helpless frozen in, the tug had steam up when the first intimation of the disaster came. The value of the machinery and the money and toil which had been put into this part of the bridge were instantly forgotten when Frank Walsh, standing 500 ft. from where the men were working, saw the rails on the bridge bulge and looking up beheld the long feared movement of the ice down the river. Throwing his hands to his mouth to form a megaphone, Walsh yelled at the top of his voice to the men in the structure. Almost at the same instant the cracking of the timbers began. Seventy faces turned up stream and 140 bulging eyes saw the ice had broken from the banks and the river wide sheet was moving down upon them. Then men on top of the span scurried back to the steel structure which has been laid between pier No. 1 and pier No. 2. They were safe within a few seconds after the first warning was received. The men in the false work were less fortunate. Each man knew exactly what it meant for the ice pack to be coming down against the structure which supported them. Some of them had lain awake at night thinking of what would happen to them if they were caught unaware. Some had dreamed of the very crash which confronted them and had started in terror from their sleep. When the reality was upon them the men were anything but transfixed by fright. Each man jack of them scampered from his dangerous perch to the nearest point of safety. Only one of them took the desperate chance of climbing from the quivering structure to the steel between the other piers. This man, Fred Thompson, one of the workmen, left the false work just as it plunged to the ice covered river 100 ft. below. Long before Thompson reached safety his 69 fellow laborers had run across the derrick barge to the deck of the Jos. Rogers, commanded by Capt. Short.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Montana, Wyoming & Southern R. R. Co., recently organized to build from Miles City, Mont., to Sheridan, Wyo., has acquired control of the Yellowstone Park R. R., a 30-mile strip of track extending from Bridger, Mont., on the Northern Pacific to Clark's ford. The road acquired gives the company a part of the mileage contemplated and it is expected that the work will be pushed forward rapidly to make a connection with the Colorado & Southern. M. W. Maguire, Belfry, Mont., is general manager.

Nevada Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Southern Pacific Co. is stated to have arranged to begin work early this year on the construction of a feeder line from Fernley, skirting Pyramid Lake and making northward across the plains.

The Tonopah & Goldfield R. R. is stated to be planning to remove its shops and general offices to Goldfield, and as a result, it is said that the Las Vegas and Tonopah line, or Clark railway, will be extended to Tonopah as rapidly as it can be graded and rails and ties laid.

Neil McLean, Tonopah, Nev., is reported to have secured the contract for grading 50 miles of the projected Ely-Goldfield R. R., beginning at Goldfield.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The State Public Service Commission has authorized the Hornell & Bath Interurban Ry. Co. to build an electric road from Hornell to Bath, 24 miles in length. The new road is to pass through the towns of Hornell, Howard, Fremont, Avoca and Bath.

Bids were opened Dec. 28 at Albany by F. C. Stevens, State Superintendent of Public Works, for four contracts for work on the New York State Barge Canal, the low bidders being as follows: Contract 33, for constructing lock gates, needle beams, guard and sluice gates at various points on the new canal. Penn Bridge Co., Beaver Falls, Pa., $199,640; state engineer's estimate was $183,619. Contract 44, for constructing a little over seven miles of canal just west of Rome. Scott Bros., Baldwinsville, N. Y., $1,748,679; state engineer's estimate was $1,926,093. Contract 70, for dredging the channel of the Hudson river from Waterford northerly, a distance of 3½ miles. Shanley-Morrissey, Inc., New

York City, $779,636; state engineer's estimate was $749,300. Contract 71, for constructing dam No. 1, above Waterford, and dredging a distance of upwards of four miles. Shanley-Morrissey, Inc., New York City, $1,615,519; state engineer's estimate was $1,502,100.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Mahoning & Shenango Valley Street Ry. Co., of Youngstown, has decided to begin work as soon as the weather will permit on the double tracking of the Park & Falls line at Youngstown from Central Sq. along Market St. to Warren Ave., the double track to extend across the Market St. viaduct, the company having the franchise right for crossing the bridge with double tracks.

The Toledo, Napoleon & Lima R. R. Co. has been chartered with a capital stock of $100,000 and proposes to build an electric railway from Toledo to Lima, passing through Lucas, Henry, Defiance and Allen counties. The incorporators are M. M. Dailey, A. D. Bishop, M. E. Donaldson and N. W. Gillette.

The Mt. Vernon Street Railway & Light Co., is taking steps to secure permission to extend its system in Mt. Vernon, O.

Surveyors are reported to be establishing the grade for the double tracking of the Cincinnati, Hamilton & Dayton Ry. between Lima and Pittsburg, Pa. F. H. Alfred, Cincinnati, O., is chief engineer of the company.

Announcement has been made that Receiver C. F. M. Niles, of the Toledo & Indiana Electric Railway Co., will again attempt to sell the property at auction at Toledo on Jan. 18, the upset price to be two-thirds of the appraised value, or about $614,000.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Washita Electric Power Co. has brought suit at Ardmore to condemn lands in Carter and Murray counties on the Washita river for the purpose of building a water power plant.

C. G. Jones of Oklahoma City and Geo. B. Herron, of Tulsa, who propose to finance a line connecting Lawton, Okla., with Wichita Falls, Tex., have been over the route from Randlett, Okla., to Wichita Falls.

C. T. Edwards of the Citizens' Traction Co., Oklahoma City, Okla., has announced that the company has secured right of way and capital and that grading for the proposed line from Oklahoma City, to Shawnee, Okla., will be started at once.

The Lawton & Fort Sill Electric Ry. Co., has decided to issue bonds amounting to $150,000 for the construction of its proposed system of electric railways in Lawton and the line connecting Lawton, Fort Sill and Medicine Park, Okla.

Nowata, Okla., has raised a $50,000 bonus for the Osage & Western R. R., chartered a short time ago, and that road will be built from Vinita westward through Nowata and Bartlesville. From Bartlesville the road will run westward through Pawhuska and Ponca City to Enid. It will be the first east and west line across the Osage Indian country. The Osage & Western is believed to be a Katy extension.

The Utility Gas & Electric Co. of El Reno has been chartered with a capital stock of $1,000,000 for the purpose of furnishing electric power to the El Reno-Oklahoma City electric railway now in course of construction between the two cities. Grading on this line has been completed to Yukon. The incorporators of the electric company are H. H. Stevens, W. H. Crilley, C. C. McVay, F. W. Van Ness and Lydia McBride, all of El Reno.

The citizens of Altus have accepted the proposition of Messrs. Kemp and Kell of Wichita Falls, Tex., to extend the line of the Altus, Roswell & El Paso railroad from Altus to Wellington, Texas. Kemp and Kell secured an option from Ed Kennedy, the promoter, for that much of the line, and will begin construction immediately upon the signing up for the bonus money by the towns interested. They are now building the Wichita Falls & Northwestern Ry. north through western Oklahoma.

Announcement has been made that the Midland Valley, now in operation from Fort Smith, Ark., to Arkansas City, Kas., through northern Oklahoma, will soon build a branch line from Warner to Webber Falls in Muskogee county. This short line, if constructed, will tap a very valuable territory in the Arkansas river valley. C. Kaighn, Muskogee, Okla., is engineer.

A contract has been signed in New York city between the Shawnee Electric Co. and a bond company, financing an electric interurban from Shawnee through McCloud to Oklahoma City. C. T. Edwards, president of the company, who has been engineering the deal in New York, is the man who built the electric interurban between Dallas and Fort Worth, Texas. Permanent survey of the Shawnee-Oklahoma City line will start in a few days.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The Washington-Oregon Traction Co. is stated to have effected final arrangements with the business men of Pendleton, whereby it will commence construction on six miles of line in Pendleton. The line is to be operated with gasoline motors at first, but is to be electrified later on. D. Fitzgerald, Pendleton, is interested.

The Nevada-California-Oregon R. R., Geo. S. Oliver, chief engineer, Reno, Nev., is reported to have awarded the contract for grading the extension to Lakeview to Nugent & Richardson, who have been engaged for several months constructing the Oregon Valley Land Co.'s canal in Goose Lake Valley, near Lakeview. Nugent & Richardson will finish their work on the canal in January and will then commence work for the N.-C.-O. A large number of men and horses will be employed and the work will be pushed as fast as the weather will permit.

The Portland Railway, Light & Power Co. is to at once extend its Broadway street car line to 24th St.

The Pacific Engineering Co., Portland, has been awarded the contract for building the foundation for the steam power plant of the Portland Railway, Light & Power Co., to be erected on the river front at East Lincoln St., Portland. The contract calls for the driving of 4,000 piles, the building of a timber bulkhead to protect the pile foundation and the covering of the entire foundation with a 3-ft. concrete mat. After the piles are driven, a steam dredge will pump sand and gravel from the bottom of the Willamette river, covering the entire area of piling, and on this will be laid a concrete mat and the whole surrounded by a heavy bulkhead.

The following bids were received Dec. 22 at the U. S. Engineer's Office, Portland, for repairs to the government dredge Chinook: Marine Iron Works, St. Johns, Portland, $132,000, not including new boilers. Willamette Iron & Steel Works, $162,500, with repairs to the old boilers, and $182,500 if new boilers were to be installed. Heffernan Drydock Co., $171,000, or $189,340 with new boilers. Union Iron Works, $175,000, or $195,000 with new boilers. Moore & Scott Iron Works, $176,000, or $196,000 with new boilers. Risdon Locomotive & Iron Works, $183,400, with no bid on new boilers. Repairs on the Chinook will include the removal of the upper deck between points about 59 ft. aft of the stem, and about 70 ft. forward of the stern, the removal of the sides of the vessel down to a point 8 ins. above the main deck, and the lowering of all davits and other attachments to the sides of the vessel about 8 ft. between the above mentioned points. It will include the repairing of the boilers and the furnishing and installing of new oil tanks.

The Corvallis & Eastern R. R. Co., has surveys under way for the construction of its proposed line from Yaquina to Newport, Ore., and construction work will be started soon. G. W. Boschke is chief engineer of the company at Portland, Ore.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Pittsburg & Great Lakes Connecting R. R. has been chartered and will build a 12 mile line connecting the Pittsburg & Western R. R. and the Western Allegheny R. R. The line is to run from Ellwood City, on the Pittsburg & Western, to a point near Portersville, Butler county, on the Western Allegheny road. The incorporators are: President, J. Rush Snyder, Pittsburg; directors, C. J. Boak, G. T. Snyder, I. Boak, Pittsburg; C. F. Armour, Girard; W. H. Evans, Baltimore; R. G. Boak, C. H. Akens, New Castle, and P. H Sechler, Butler.

The W. S. P. Shields Construction Co. has commenced work on its contract for constructing the substructure for the $700,000 municipal pier at Vine St., Philadelphia. The contract amounts to about $300,000. The substructure will be of concrete 1 ft. above the low water line, and will be of arched construction from low water line to the roof of the floor, so that the under section may be examined from time to time by means of the use of a small boat. The supports will be of pilings. The superstructure will be of steel and concrete and will be fire proof all through. It will be two stories for its entire length, but the substructure will be strong enough to bear three stories if at any future time it is decided to put on the extra story.

The construction of a trolley line from Central Valley to Blue Church, Steinsburg, East Greenville and Pennsburg is projected. This is a well populated territory and would make a valuable link between the Saucon and Perkiomen Valleys.

D. J. Carson, Du Bois, Pa., who has the contract for constructing two mine branches for the Buffalo, Rochester & Pittsburg Ry., as noted in our Dec. 22 issue, has commenced the grading work. The operations are in Indiana County. The Nesbit Run branch, with headquarters at Clarksburg, is about two miles long, and contains the excavation of about 30,000 cu. yds. of material. John Hennessey, of East Branch, Delaware County, New York, is superintendent or "walking boss" on this operation, and E. W. Read, of Lancaster, Pa., is one of the grading foremen. Harry E. Faust, of Du Bois, Pa., is timekeeper. Two or three months will be required on this operation. The Jacksonville branch is four miles distant, with headquarters at Parkwood, and embraces 200,000 cu yds. of excavation. The length of the line is about four miles. R. K. Woodson, of Lyndora, Pa., is superintendent or "walking boss" on this operation, with Paul Carson, of Du Bois, Pa., as assistant superintendent.

Tennessee Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Lakeview Traction Co., W. W. Hayden, chief engineer, Memphis, Tenn., opened bids Jan. 5 for track laying on 12 miles of railroad, Memphis, Tenn., to Lakeview, Miss.; also for 1,025 lin. ft. of pile trestle.

The Clarksdale, Covington & Collierville Interurban R. R. Co., has applied for an amendment to its original charter authorizing it to run four lines through Memphis, two north and south and two east and west.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Right of way is being secured for the Waco, Belton & Georgetown Ry., and it is announced that surveys were to be started shortly. It now looks as though the road, which will be nearly an air line between Waco, Belton, Cornhill and Georgetown, will be built and in operation by next fall. George M Feltz, Belton, Tex., and Judge George W Tyler, Belton, are interested.

E. S. White, Fort Worth, engineer for the Levee Commission, which is to build levees along the Trinity River, as stated in our last issue, has completed final surveys and estimates and announces that the $250,000 bond issue voted for the district last August will be sufficient to construct the levees. Nearly half

of the money, it is estimated, will be required to purchase the right of way for the levees, to remove the trees and prepare the ground. The balance will be required for the actual construction. The contract for the work will be let in a short time.

The Cotton Belt R. R. is said to have purchased extensive gravel beds on the White Rock Creek, about six miles north of Waco. The company will build a spur to connect the gravel purchased with the main line, a distance of four or five miles. This gravel will be used in permanent improvement of the roadbed.

Citizens of Eldorado have purchased $100,000 of bonds of the Kansas City, Mexico & Orient Ry., thus assuring the extension of the line to that city, which is 45 miles from San Angelo. Work on the extension is to be commenced in January and the line completed by July, 1911. C. H. Webster, Sweetwater, Tex., is chief engineer.

Work is under way from Dalhart on the construction of the Enid, Ochiltree & Western R. R. The line is projected from Dalhart west to Ochiltree, a distance of 113 miles, and 30 miles have already been graded. The Panhandle Construction Co., F. L. Bryant, general manager, Dalhart, has the contract.

Preliminary surveys for the new railroad from Laredo to Brownsville have been started. C. M. Fish, Laredo, is reported to be interested.

The railroad committee of Terrell has secured $60,000 on the bonus to secure the Memphis, Paris & Gulf Railroad for that city. It is expected that the entire amount of $100,000 will be raised in the near future.

The sum of $400,000 is to be expended for ballasting and other improvements to the St. Louis, Brownsville & Mexico, R. R. C. B. Rodgers, Kingsville, Tex., is general manager.

Surveys are to be made for an extension of the Marshall & East Texas R. R., a Frisco line. The Marshall & East Texas R. R. at present extends from Winnsboro to Marshall, and, it is said, an extension is planned to connect it with the Frisco at Paris. R. J. Lockwood, Marshall, is chief engineer.

According to reports from Temple, Tex., surveyors are at work on the proposed line of the Temple & Northwestern from Temple north toward Hamilton, and grading will be started soon. Promoters of the line are at Temple, Tex.

It is reported that R. H. Baker of Austin will sever his connection with the Trinity & Brazos Valley Ry. as president about Feb. 1 and will engage in the construction of a new railroad in Texas.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Frank L. Capening of Provo has applied to the State Engineer for 5,000 acre feet of water in order to raise the height of the Gunnison reservoir dam 10 ft. It is proposed to store all the surplus and unappropriated waters of the Sanpete River.

The irrigation company at Kanab has awarded a contract to Cramm Brothers & Adams for drilling a 425 ft. tunnel. The contract price is $3.12½ per foot and the work is to be completed by Jan. 24.

The Belknap Power Co. of which James Long, former state representative, is president, is planning a $300,000 waterpower project near Marysvale, in Piute County, in the Sevier river country. The project involves the building of a big plant capable of generating from 6,000 to 7,000 h.p., which will be used for generating electricity to light the homes of settlers and the towns in the valleys, besides furnishing power to run the machinery in mines in the Gold Mountain and Marysvale district.

Preliminary surveys for three extensions of the Harriman lines in Utah are being made and the construction of these lines will be started next year. The new lines extend from Salt Lake through Emigration canyon to Evanston, from Salt Lake paralleling the Western Pacific to connect with the Southern Pacific between Cobre and Elko, and from a point on the Lucin cut off to connect with the main line of the Oregon Short Line to the northwest. The Utah Construction Co. of Ogden, Utah, is reported to have secured the contracts for a large part of the grading on the extensions of the Harriman lines in Utah and it is said that the forces of this company which have been at work on the Western Pacific for the last three years will be started on the new lines early next spring.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Roanoke Electric Co. is said to be planning to begin work in the early spring on its hydro electric development on the Staunton River near Brookneal. The site of the proposed dam is a mile above Brookneal, on the Staunton River. It is 26 miles from Lynchburg, 80 from Roanoke and 50 from Danville, while Altavista, the new town at the junction of the Virginia and Southern railways, is 28 miles away. The dam required for this purpose would be 1,300 ft. long, including the power house, and the height will be 25 ft. The water there is sufficient to deliver 2,000 hp. into Lynchburg 24 hours a day. The entire plant, including the cost of lines to deliver the power to a storage station in South Lynchburg, would be $750,000. Judge E. D. Newman, Woodstock, Va., is reported to be interested.

Surveys have been started near Ashland for a line for a railway, which will be a continuation of the Richmond & Chesapeake Bay R. R., into Washington. After the route has been established from Ashland to the national capital; a second line will be laid off at right angles and running eastward to the Chesapeake bay. From Richmond to Washington the line will be about 115 miles long, the new road practically paralleling the Richmond, Fredericksburg. Actual construction will probably begin early next spring, it being believed that the engineers' estimates will be completed by that time.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Vance Lumber Co. of Elma, Wash., has applied to the state land office to purchase a right of way across section 16, township 17, range 5, west in Chehalis County.

All but two miles of the right of way has been secured for the Northern Pacific's new water grade line out of Tacoma via Point Defiance and the Narrows. Announcement of the beginning of construction work on the new line is expected early in 1910 and it is likely that spring will see work under way.

Press reports from Walla Walla state that the North Coast R. R. has definitely located its route from Walla Walla east through the mountains, over the Snake River and up through the mountains to Landor, Wyo. According to the reports the route is east from Walla Walla, first going toward the north fork of the river, tunneling through a hill to get into the canyon of this stream, which it hits several feet above the bed of the creek. Taking a 3 per cent grade up the river, it finally runs down to the bottom of the canyon, where there is a bridge, and the road winds back in the other direction, still going up grade, but down the river. It then goes toward the south fork, making another tunnel and hitting the canyon of that stream some 1,200 ft. above the water. Again the road hits upstream, on a 3 per cent grade, until the bed of the river is reached. Here another tunnel is made, coming out on the Looking Glass, from where the line goes to the Grande Ronde, thence down that stream to the Snake and Salmon and then east across the mountains to Landor, Wyo.

A line on the definite location of the Toppenish, Simcoe & Western R. R. (a Northern Pacific feeder) has been given out through a condemnation suit filed in the superior court at North Yakima. Instead of running south of Mt. Adams and joining the Vancouver spur at Yacolt, as was at first supposed, or of joining the spur from Lyle at Goldendale, the Toppenish road will run to Fort Simcoe and thence south direct to Lyle. The new road will give the Yakima valley a direct outlet to Portland and will be on a down grade, except for a short distance in getting over the Simcoe hills.

An agreement has been reached between representatives of Stone & Webster, Boston, Mass., and the citizens' committee of Bellingham for the construction of 32 miles of interurban road. According to the agreement citizens of Bellingham are to subscribe for $400,000 of stock of the Whatcom County Railway & Light Co., which is to control the road.

The Grays Harbor Interurban Co., mentioned in our last issue, has had surveys started on its projected line between Hoquiam and Tacoma, via Olympia, and it is announced that construction work will be started as soon as the right of way can be secured. Eldridge Wheeler, Montesano, Wash., is the chief promoter.

Capitalists of Seattle and Portland, Ore., have had preliminary lines run in the South Bay country for the proposed canal between Grays Harbor and the Columbia River. According to the plan outlined the canal will be 30 ft. in width, having a mean depth of 12 ft. It is estimated that there are between 10 and 20 miles of excavation between South Bay and Willapa Harbor. Much of this is easy to excavate, and a chain of small lakes will be utilized. From the southern shore of Shoalwater Bay the canal eventually will find its way into the Columbia River a few miles east of Oneida. It is the intention of the promoters to use the canal for freight and passenger service and serve a large section of country now isolated. The Inland Waterways & Canal Co. has been organized at South Bend, Wash., as a holding company for the project. The work will cost about $60,000, it is thought. Special dredges will be constructed at South Bend this winter and construction work started in the spring. Charles N. Hudson is the engineer.

Swansen Bros. have removed their outfit from Montana to Okanogan, Wash., and have begun work on the subcontract on the Oroville-Paternos branch of the Great Northern Ry. Several other outfits are located between Pateros and Brewster on this work.

The Seattle-Tacoma Short Line Electric Co., which proposes the construction of a new interurban line between Seattle and Tacoma, has filed a mortgage for $3,500,000, indicating that arrangements have been made for securing funds to build the line. Surveys for the line have been completed and a private way for practically all the distance has been secured. E. J. Felt, Tacoma, is interested.

The city council of Seattle has passed over the mayor's veto three bills giving the Northern Pacific Ry. permanent franchises around the Lake Union Basin. The franchise granted gives the Northern Pacific access to a large manufacturing district which will have a fresh-water harbor when the Lake Washington Canal project is completed.

Residents in the Yakima valley have formed an association and have raised money for a survey to be submitted to the U. S. Reclamation Service of an extension of the ditch already proposed in Kittitas County some 200 miles, bringing the water from the lakes in the Cascades along the highest ridges possible to the Columbia. The water would reach North Yakima, it is estimated at an altitude of 2,000 ft., which would mean the reclamation of all the bare ridges surrounding the city and long considered worthless. Lee A. Johnson of Sunnyside is president of the association and H. W. Goff of Colfax. W. W. Robinson of Seattle and ranchers of the upper and lower valleys are among the promoters of the project.

Olsen & Anderson, sub-contractors on the Bovill branch of the Chicago, Milwaukee & Puget Sound Ry., have moved their outfit to Mount Hope on the North Coast, seven miles from Fairfield.

Reports from Colfax, Wash., state that W. C. Buck, assistant engineer of the Oregon Ry. & Navigation Co., has started surveys for the construction of a line from Lacrosse to Pullman. As proposed the line will pass

through Dusty and Wilcox, Wash. G. W. Boschke, Portland, Ore., is chief engineer of the railroad company.

Active work will soon commence on the erection of the large new cement dam at the head of the Hatt slough, one mile east of Florena. The former dam, built by the government last year, is stated to have proved inadequate, and on account of its present construction has been a constant menace to the neighboring farmers. The present plans for the new dam call for an entirely different manner of construction, and when completed will add an immense business to the shipping interests of the lower river valley, as well as to the east and north sides of Camano island. The length of the proposed dam will be about 900 ft. by 6 to 18 ft. high, and will be of re-enforced concrete. The estimated cost is $30,000.

The St. Helena Public Service Co., of which Dr. Henry Waldo Coe, Portland, Ore., is the principal stockholder, is planning to begin work this year at Castle Rock, Wash., on its projected railroad and hopes to have 15 miles completed during the year. The railroad as projected is to be about 200 miles long, extending from Vancouver to the copper districts in the vicinity of Mount St. Helena, Wash. Surveys have been made and right of way for practically the entire distance has been secured.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Isham Randolph, consulting engineer, Chicago, Ill., has submitted plans to the city council of Milwaukee for the proposed new harbor for that city. The plans contemplate the expenditure of $6,000,000, $4,000,000 by the city and the rest by the government.

Business men of Sheboygan are trying to get the Milwaukee road to extend its line from Plymouth to Sheboygan in order that a competing line may be had with the Northwestern road. If the Milwaukee road will not build it is likely several Sheboygan business men will build the line as a business enterprise.

Advices from Manitowoc state that Dr. J. S. Pritchard, who has been identified with the Wisconsin Central and the Chicago & Northwestern roads for many years, is at the head of a company which has secured an option on the mill and site at Rapids, on the Manitowoc River, two miles west of Manitowoc, and has employed hydraulic engineers and is making a survey of the property. It is expected that from 2,000 to 3,000 hp. will be developed and the power will be carried by cables to the city limits and sold to Manitowoc manufacturing establishments. It is expected the plant will be in operation early next year.

The State Railroad Commission has been holding hearings at Madison on the application of the Milwaukee & Fox River Valley R. R., which intends to build an electric line to Fond du Lac.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The Canadian Northern Ry. has taken over the charter and interests of the Victoria & Barkley Sound Ry. Co. of Victoria, B. C. The latter railway has completed surveys for some 50 miles out of Victoria, and these being taken over by the C. N. R. will greatly expedite preliminary arrangements for construction of the Vancouver Island portion of the third Canadian transcontinental line. The Victoria & Barkley Sound Railway Co. depended upon obtaining provincial aid for its undertaking and tentative arrangements were made with British financiers to provide $5,000,000 for construction of 100 miles of road projected. The Victoria & Barkley Sound division of the C. N. R. will open up 100 miles of southern Vancouver Island.

Wade, Whealler & McQuarrie, attorneys, Victoria, B. C., are to apply for incorporation for a company with power to build and operate a railway, commencing at Port Moody, for 20 miles.

The Southwestern Traction Co. of London, Ont., is planning to extend its line from Brantford to London in the spring, involving construction of the line from Brantford to Woodstock. At the latter place the Woodstock to Ingersoll line will be taken over, and the line from London to Ingersoll will be projected. Other lines are in contemplation. S. B. Mower is manager.

The Kettle Valley Lines, F. M. Holland, general manager, Republic, Wash., proposes to extend the system west via the west fork of the Kettle River, through the Okanogan and Similkameen districts and over the Hope Mountains to Hope. Legislation granting a subsidy of $5,000 a mile from Midway to Nicola, a distance of 150 miles, will be introduced at the coming session of parliament.

The Winnipeg Electric Ry. Co. has submitted a plan to the board of control of Winnipeg, showing a conduit to be constructed in Portage Ave. east from the corner of Main and Portage to its Mill St. substation to carry return feed wires.

The Montreal Street Ry. Co. of Montreal, Que., has asked the city council of that city for a number of franchises for new lines, extensions and for double tracking. An important franchise in the business district is the double tracking of St. Joseph St. to the city limits to enable the St. Denis cars to go out and back on St. James St. instead of on Craig St. as now. The company wants either Lagauchetiere St. or Vitre St. widened in order to have a parallel line with Craig. It is also suggested that Craig St. be widened possibly to Vitre St., the houses razed, and Craig St. made a boulevard. A new line through the western and river front part of the city, William St. throughout, down McCord, along Ottawa, down Shannon, Wellington to McGill St., is also asked. The city council of St. Louis, a suburb of Montreal, has already granted franchise to the Montreal Street Ry. Co. for a number of new streets.

The British Columbia Electric Ry. Co. is to expend $500,000 in New Westminster this year. A large part of the $500,000 to be spent in New Westminster will go into the extension of the present car shops and the remainder into rolling stock. One hundred freight cars, four locomotives and 100 passenger cars are to be built during 1910 at the Westminster shops.

The Grand Trunk Pacific Ry. is completing preparations for active construction of branch lines during 1910. It is the intention to open for development a large, new territory in the wheat belt. In the planning of the branch lines the G. T. P. aims at avoiding sections only cultivatable by irrigation. It plans to open up country where there has always been an abundance of moisture and where crop failure is unknown.

The Couteau Power Co. is understood to have financed to the extent of $2,000,000 its scheme for installing a network of rural tramlines in the Okanogan district.

Track laying on the western end of the Grand Trunk Pacific Ry. has been continued despite the cold weather and a track layer with a big force of men has been making rapid progress laying steel. Since the completion of the Pembina River bridge steel has been laid down at the rate of two miles a day and the line is now finished for 84 miles to the west of Edmonton. A section of this line was completed early in the fall and fully ballasted. Tracklaying will be continued throughout the winter to the termination of the grade on McLeod River. As soon as that point is reached, material and supplies will be rushed in to make ready for an early start on grading work on the next 150 miles. The contracts for this work will bring the line to Fete Jeune Cache in the heart of the Rocky Mountains, and it is confidently expected that the grading will be sufficiently advanced to allow steel to be laid on the greater portion of these contracts in 1910. Excellent progress is being made from Prince Rupert east on the Pacific Coast side. By this time next year 250 miles or more should be in operation under construction, leaving about 400 miles to connect up.

BIDS ASKED.

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

Indianapolis, Ind.—Until Jan. 15, by B. H. Miller, City Engineer, for the construction of a stone and concrete bridge over Pogues run at Commerce Ave.

Cincinnati, O.—Until noon, Jan. 7, by Board of County Commissioners, for the repairing the east abutment of the bridge over the Little Miami River on the New Richmond Pike in Anderson Township.

Columbus, O.—Until noon, Jan. 28, by County Commissioners, for constructing a new floor system on the Decker bridge, over Little Walnut Creek, on the Groveport and Lithopolis Pike, about one mile southeast of Groveport, in Madison Township, and on the Grand View Ave. bridge over the Scioto River, in Franklin Township.

Fremont, O.—Until 10:30 a. m., Jan. 24, by County Auditor, for the construction of a wagon bridge on the Monroeville Road. The structure will be of steel, having two 62-ft. spans and one 80-ft. span with 20-ft. roadway.

Norwalk, O.—Until 10:30 a. m., standard time, Jan. 24, by the Board of County Commissioners of Huron County, O., Norwalk, O., for the furnishing and erecting of a steel riveted truss bridge over Huron River at Monroeville, O., known as Main St. bridge. Length of bridge, 204 ft., consisting of two spans each 62 ft., and one span 80 ft. Width of roadway, 20 ft., with sidewalk on one side 4 ft. wide. Certified check for $300 must accompany each bid. Jay E. Smith, County Auditor.

Wagoner, Okla.—Until Jan. 18, by County Commissioners, for the construction of a steel bridge over Verdigris River at Mingo Ferry. The structure will be about 300 ft. in length on tubular foundations. J. E. Hildt is County Clerk.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Hot Springs, Ark.—Until 3 p. m., March 1 by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction including plumbing, gas piping, heating apparatus, electric conduits and wiring of an extension to the U. S. Post Office at Hot Springs, Ark.

Denver, Colo.—Until 3 p. m., Feb. 17, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, including plumbing and draining of the U. S. Post Office and Court House at Denver, Colo.

Fort Barrancas, Fla.—Until 11 a. m., Jan. 28, by Constructing Quartermaster, for the construction, including plumbing, heating and electric lighting, of one double set of non-commissioned officers' quarters and one kitchen at Fort Barrancas and one double set of civil engineer's quarters at Fort Pickens, Fla.

Chicago, Ill.—Until 4 p. m., Jan. 5, by Directors of the Chicago Public Library for structural alterations, ornamental iron work and electric elevator. H. G. Wilson is Secretary of the Board of Directors.

Rock Island, Ill.—Until 3 p. m., Feb. 21, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, including plumbing, heating, wiring, and standard clock systems, of the extension to the U. S. Post Office at Rock Island, Ill.

Ames, Ia.—Until 2 p. m., Jan. 20, by D. A. Emery, Secretary State Board of Education, Des Moines, Ia., for the construction of a domestic technology building for the Iowa State College of Agriculture and Mechanic Arts at Ames, Ia.

Jena, La.—Until Jan. 3, by H. C. Hartner, President Police Jury, for the construction of a county court house and jail. Emile Weil, New Orleans, La., is the architect.

Meridian, Miss.—Until 3 p. m., Feb. 8, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the extension, remodeling, etc., including plumbing, gas piping, heating apparatus, electric conduits and wiring and standard clock system, of the U. S. Post Office and Court House at Meridian, Miss.

Fort Omaha, Neb.—Until 11 a. m., Jan. 19, by Capt. George S. Gibbs, Constructing Quartermaster, for the construction of one oil house, one combined hay shed and granary and for the construction, plumbing and electric wiring of one stable.

Goldsboro, N. C.—Until 3 p. m., Jan. 31, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, including plumbing, gas piping, heating apparatus, electric conduits and wiring, of an extension, remodeling, etc., to the U. S. Post Office at Goldsboro.

Tower City, N. Dak.—Until 1 p. m., Jan. 10, by S. F. Sherman, Clerk, Board of Education, for the erection of a high school building.

Fort Bayard, N. M.—Until 11 a. m., Feb. 15, by Capt. F. P. Vestal, Constructing Quarter-

master, for the construction, plumbing, heating, electric lighting and fixtures of one double set of hospital sergeants' quarters and one power plant with machinery for refrigerating and electric lighting systems.

New York, N. Y.—Until 2:30 p. m., Jan. 11, by Department of Public Charities, E. 26th St., New York, for furnishing all necessary labor and material for the construction of a dormitory for female inmates at the New York City Farm Colony.

Fort Hancock, N. J.—Until noon, Jan. 15, by C. J. Goodier, Constructing Quartermaster, for the construction, plumbing, heating, electric wiring and fixtures of one double set N. C. O. quarters (stucco); one double set of firemen's quarters (brick); and construction of second story (brick) to quartermaster's storehouse at Fort Hancock, N. J.

Columbus Barracks, O.—Until 10 a. m. Jan. 24, by Capt. H. J. Hirsch, Constructing Quartermaster, for the construction of an isolation hospital. The work includes plumbing, heating, electric light wiring and fixtures.

Franklin, Pa.—Until 2 p. m., Jan. 11 by E. K. Smiley, Clerk, Board County Commissioners, for the construction of a county jail estimated to cost $50,000.

Houston, Tex.—Until noon, Jan. 11, by Commissioners' Court of Harris County, for furnishing electrical fixtures for Harris County Court House. A. E. Amerman is County Judge, Houston, Tex.

Thorndale, Tex.—Until 2 p. m., Jan. 10, by C. D. Hill & Co., Wilson Bldg., Dallas, Tex., for the construction of a 2-story bank building for the First National Bank of Thorndale, Tex. A certified check for $500 must accompany each bid.

Fort Monroe, Va.—Until 10 a. m., Jan. 26, by Capt. Ernest R. Tilton, Constructing Quartermaster, for the alterations and repairs to old artillery school building at Fort Monroe, Va., the work including electric lighting, wiring, heating and plumbing.

Spokane, Wash.—Until 3 p. m., Feb. 9, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the installation of a vacum cleaning system in the United States Post Office, Court House and Custom House at Spokane, Wash.

Vancouver Barracks, Wash.—Until 11 a. m., Jan. 26, by Constructing Quartermaster, for the construction of an artillery stable of brick with slate roof, for 138 animals at the Vancouver Barracks.

Cassville, Wis.—Until 8 p. m., Jan. 18, by Walter Kleinpell, Clerk of School District at Cassville, Wis., for the construction and heating of a school building at Cassville, Wis. A certified check for $300 must be filed with each bid.

Winnipeg, Man.—Until 11 a. m., Feb. 15, by the Chairman of the Board of Control, Winnipeg, Can., for the supply and erection of the various portions of the equipment for the Terminal Station at Winnipeg and for the turbine governors and gate valves for the generating station. M. Peterson, Secretary Board of Control.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

Fort Mason, San Francisco, Cal.—Until 11 a. m., Jan. 6, by Maj. George McK. Williamson, Constructing Quartermaster, for the construction of a supply road to pumping station, Presidio, of San Francisco, Cal.

Palatka, Fla.—Until 2 p. m., Jan. 6, by Henry Hutchison, Clerk of Circuit Court, for the construction of a hard road from Palatka to Rice Creek.

Lewiston, Ida.—Until Jan. 16, by City Council for the construction of pavement on Main St., east of the Union Depot.

Vicksburg, Miss.—Until 8 p. m., Jan. 17, by Mayor and Aldermen, for paving Veto St., between Washington and Monroe Sts., and Drummond St., between Harris St. and Bowman Ave., with granitoid, brick, bitulithic, asphalt, creosoted wooden blocks and mineral rubber. J. J. Hayes is Mayor.

New York, N. Y.—Until 2.30 p. m., Jan. 14, by the Department of Public Charities, foot of East 26th St., New York, for furnishing all labor and material required for macadam roadways, brick gutters, cement walks, curbs, catch basins and drainage pipes at Coney Island Hospital site on Ocean Parkway, Borough of Brooklyn. Robert W. Hebberd, Commissioner.

Cincinnati, O.—Until noon, Jan. 7, by Board of County Commissioners, for improving the Stone Mill Road from Colerain Pike at Dunlap to County line Colerain Township. Stanley Struble is President of the Board.

Cincinnati, O.—Until noon, Jan. 21, by County Commissioners, for the construction of improvements to Congress Ave. through the village of Glendale. Fred Dreihs is Clerk of the Board of County Commissioners.

Columbus, O.—Until noon, Jan. 28, by County Commissioners, for grading, graveling, etc., the Stygler hill on the Stygler road, about one and one-half miles northwest of Gahanna, in Mifflin Township.

Fort Worth, Tex.—Until Jan. 5, by City Council for paving Lipscomb St., from Terrell Ave., to Capps St.

Sewers.

Bids are asked on following work, the notes being arranged alphabetically by states:

Quincy, Fla.—Until 6 p. m., Jan. 12, by George H. Palmer, City Engineer, for the construction of sewer system. The work includes approximately 7½ miles of 8, 12, 15 and 18-in. pipe sewers from 4 to 25 ft.; 70 manholes, 20 flush tanks, and one septic tank.

Fort Dodge, Ia.—Until 5 p. m., Jan. 10, by City Council, for furnishing all material and labor for the construction of a 10-in. storm sewer with four catch basins. W. L. Tang is City Clerk.

PROJECTED WORK.

Bridges.

Items Arranged Alphabetically by States.

Globe, Ariz.—City Council is soon to call for bids for the construction of a bridge over Pinal Creek on North Broad St.

Pittsfield, Ill.—Advices from this place state that the Wabash R. R. Co., is to construct three new bridges on its Springfield Division over the sloughs of the Illinois River. The structures will be of concrete and stone.

Fort Scott, Kan.—County Commissioners are to hold a meeting to consider the construction of a bridge over the river at Woodland Ford, 6 miles northwest of the city.

Hutchinson, Kan.—City Commissioners have decided to construct a single, reinforced concrete arch with a 50 ft. clear span over Cow Creek at the intersection of Main St., and Ave. "A." City Engineer G. L. McLane reports that it will be possible to span the creek with a single arch, as a rise of 6 to 7 ft. may be secured. The structure will cover the creek for a distance of over 300 ft, with an area of about 16,000 sq. ft. City Engineer is to prepare plans, which, after approval by the Commissioners will be submitted to contractors for bids. This will be the first structure of the kind in the city, and the commissioners have by their decision, fixed the policy of replacing the 12 or 15 wooden bridges now spanning the creek with permanent bridges when renewals are required.

Westmoreland, Kan.—County Commissioners have agreed to appropriate $4,000 if Blue Township would vote $7,000 of bonds for the construction of an $11,000 bridge over the river in that township. The structure as proposed will be 400 ft. long and will be of steel.

Shreveport, La.—Plans have been approved by Capt. C. S. Smith, U. S. Engineer, Vicksburg, Miss., for the construction of a bridge across the Red River at the foot of Texas St., and city council will soon hold a meeting to authorize the construction of the structure.

Torras, La.—The Mississippi River Commission is to call a meeting at the office of Maj. H. Burgess, 2335 St. Charles Ave., New Orleans, La., for repairing the bridge over Old River in Torras, La. The improvements contemplated will require an expenditure of $9,000.

Lansing, Mich.—Plans and specifications have been prepared for the construction of a foot bridge over the Grand River at South St. The structure is estimated to cost about $1,300.

Duluth, Minn.—A petition has been filed with the City Council asking for the construction of a steel foot bridge on Twelfth Ave., from Michigan St., to Railroad St.

Springfield, Mo.—City Engineer Horton is preparing plans and making preliminary surveys for the construction of the proposed viaduct across the Jordan Valley on Grant St.

Schuyler, Neb.—Business Men of this city are to take steps toward securing the construction of a new bridge over the Platte River in the Spring.

Newark, N. J.—River and Navigation Committee of the Board of Trade is to hold a meeting to discuss the addition of facilities for pedestrian and vehicular traffic over the new Center St. bridge which is to be built by the Pennsylvania R. R.

Niagara Falls, N. Y.—Grade Crossing Commission approved plans and specifications prepared by the City Engineer, for the construction of a bridge over the New York Central tracks at the North End. The structure will be of steel and will have a 28 ft. road way. The estimated cost of the work is $75,000.

Rensselaer, N. Y.—Board of Aldermen are to consider plans for the construction of the new highway bridge over the Columbia Turnpike to be built by the New York Central R. R.

Springfield, O.—City is taking steps toward having the Cleveland, Cincinnati, Chicago &

St. Louis R. R. Co., repair the present structure or build a new bridge over its tracks at East High St. M. J. Bahin is City Engineer.

Toledo, O.—According to every indication the Pneumatic Caisson Co., Troy, N. Y., will be awarded the contract for the construction of the new $777,777 lift bridge over the river at Cherry St. The Board of Public Service and the Board of Control favor bid of the above company.

Youngstown, O.—Plans have been completed for the proposed overhead bridge at Holmes St. and will be submitted to the West End and North Side Improvement Clubs for approval.

Portland, Ore.—Bids are to be received sometime during January by the Oregon R. R. & Navigation Co., for the construction of a new railroad bridge at Oregon St. over the river. As proposed the structure will have two decks and a lower and upper draw, and is estimated to cost $1,300,000.

Scranton, Pa.—Resolution has been passed by the City Council and signed by the mayor providing for the construction of a viaduct over the Lackawanna R. R. in Keyser Valley at Washburn St. Plans and specifications will be prepared for the structure at once.

Chattanooga, Tenn.—City Council has made an appropriation for repairing the viaduct in that city.

Dallas, Tex.—Specifications have been approved by the County Commissioners for the construction of a $90,000 bridge to be erected at Miller's Ferry, between this city and Hutchins.

Laredo, Tex.—A bill has been introduced into the Congress at Washington, D. C., authorizing the National Mexican Ry. Co., to construct a bridge over the Rio Grande River connecting Nuevo Laredo, Mexico and Laredo, Tex.

San Antonio, Tex.—According to reports the San Antonio & Aransas Pass Ry., has announced that it will construct a steel bridge across the Colorado River between Altair and Eagle Lake. The structure is estimated to cost $70,000. J. S. Peter, San Antonio, Tex., is General Manager of the railroad.

Seattle, Wash.—Surveys and plans have been completed by G. F. Cotterill, Surveyor and F. W. Bowerman, Construction Engineer, for the new Railroad Avenue viaduct. The structure as planned will be 2 miles in length, straight across the Bay from Railroad Ave., in line with Alki Point and about 30 or 40 ft. above high tide.

Tacoma, Wash.—Resolution is to come before the city council providing for the construction of a wooden bridge over the gulch on Fairbanks St.

Milwaukee, Wis.—Resolution is to be introduced to the city council providing for an issue of $200,000 worth of bonds for the construction of a new bridge over the Milwaukee River at Buffalo St.

Cameron, Wis.—Citizens recently voted to rebuild the bridge over the Menomonie River in the town of Stanley.

Neillsville, Wis.—County Commissioners have decided to construct a steel bridge over Eau Claire River near Tioga.

St. John, N. B.—Council is considering the proposition to construct a bridge over the Harbor at a cost of $750,000, the cost being paid by the city, province and Dominion.

Sherbrooke, Que.—City Aldermen are in favor of replacing the Aylmer bridge across the St. Francos River, and a committee to investigate the matter was appointed.

Ottawa, Ont.—All bids recently received for removing the wreckage of the Quebec Bridge have been rejected and the work which is estimated to cost $50,000 will be let by private contract.

Roads and Streets.

Items Arranged Alphabetically by States.

Little Rock, Ark.—Petition is being circulated for the purpose of organizing a new paving district to include East Second St., from Olive to Smothers, Magnolia from Washington Ave., north to Ninth St., and Olive between Ninth St., and Washington Ave. It is planned to disburse between $15,000 and $18,000 for paving.

Phoenix, Ariz.—City is contemplating on paving the streets of the downtown district before constructing the sewers.

Jonesboro, Ark.—The street paving commission, improvement district No. 4 has rejected all bids for paving work to be done in this city. They will soon make an inspection tour of other cities after which the commission will again advertise for bids.

San Jose, Cal.—Board of public improvements has been asked to lay out, open and maintain a public Road District No. 5, commencing at the southwest corner of S. J. Brun's ranch on Hawthorne Ave., and running to San Antonio Ave.

San Diego, Cal.—City Council has instructed the city engineer to prepare plans, drawings, specifications and cross sections for the repaving of M St., from Sixth to 16th Sts., with asphalt laid on a concrete base; also for the construction of necessary culverts.

Stockton, Cal.—Board of Supervisors recently received the following bids for the construction of 13.8 miles of macadam roadway in the Manteca section of the county: Clark and Henery Construction Co., of this city, at $97,846; Cotton Bros. and Co., Oakland, Cal., at $88,826. Both bids were rejected.

Colorado Springs, Colo.—A meeting was recently held by the property owners included in the proposed paving districts to discuss the various paving materials and the relative cost of each.

Denver, Colo.—Denver Motor club, C. P. Allen, chairman, has perfected plans for a vigorous campaign for better roads throughout the entire state. The state will be asked for an appropriation of $500,000.

Denver, Colo.—The highway between Colorado Springs and Denver may soon be constructed, as the state has offered to do $5,000 worth of work on the boulevard if the county commissioners of El Paso county will advance a like amount.

Savannah, Ga.—An ordinance will probably be presented to the city council soon providing for the paving of Estill Ave., from Bull St., to the Waters Road. The paving of Whitaker and Drayton Sts., is also under consideration. Asphalt block will likely be used.

Bloomington, Ill.—City Engineer has submitted to the board of local improvements estimate of cost for the laying of an asphalt resurface on West Washington St., between Madison and Roosevelt Ave. The engineer is at present making calculations for the brick pavement for the remainder of the street to the C. & A.

Chicago, Ill.—Property owners of the city have petitioned the board of local improvements to pave 200 miles of streets this year.

Elkhart, Ind.—Marion St., of this city is to be paved with asphalt at a cost of about $23,000.

Wichita, Kan.—Petition has been presented to the city commissioners for the paving of Pattie Ave., from Douglas to Kellogg with asphalt.

Wichita, Kan.—Petitions are now before the board of city commissioners for approximately 10 miles of paving at a cost of nearly $500,000. The contracts for the work will be awarded this winter and the work pushed to completion at the earliest possible date.

Winfield, Kan.—Petitions for the paving of East Ninth St., with brick; curbing, guttering and macadamizing Gary St., and the opening of the north end of Bliss St., were received by the city council recently.

New Orleans, La.—City Engineer Hardee has been instructed to prepare new plans and specifications for the paving of St. Charles Ave., from Louisiana Ave., to Carrollton Ave., with bitulithic. The new specifications will call for both paving and subsurface drainage.

New Orleans, La.—The protest against the paving of North Prieur St., from Marigny to Press Sts., has been allowed by the committee on streets and landings.

Flemington, N. J.—Petitions have been presented to the Hunterdon County Board of Freeholders asking for a macadamized road from Milford to Flemington by the way of Mount Pleasant, Everittstown, Pittstown, Quakertown and Cherryville.

Trenton, N. J.—State Highway Commissioner will recommend to the next legislature the building of about 800 miles of state roads. The commissioner is already planning on the construction of an ocean boulevard from Atlantic Highlands to Cape May.

Buffalo, N. Y.—Property owners have filed a remonstrance with the common council against the repaving of Eagle St., between Union and Michigan Sts., on the grounds that the work is not needed.

Williamsville, N. Y.—Williamsville and Amherst Business Men's Association have taken steps to convince the state highway commission that the proposition of a 16 ft., road for Williamsville road is not wide enough. They ask that the road be built 25 ft. wide.

Alliance, O.—Plans have been completed for macadamizing the Patterson St., road from Alliance to Sebring, including the paving of about half mile of the road across the lowlands adjacent to the Mahoning river. A meeting will be held by the Smith Township trustees and the Mahoning county commissioners to discuss some plan whereby the road can be improved the entire length with brick.

Cincinnati, O.—County Commissioners have approved the plans and specifications for the improvement of Congress Ave., through the village of Glendale. This improvement will cost $10,891. The board also ordered plans and specifications for the improvement of Short Ave., in Fernbank. This improvement will cost $6,315.

Cleveland, O.—Park Engineer Stinchcomb in his estimate of the cost on park maintenance and necessary improvements for 1910 has included $100,000 for the extension of Edgewater boulevard from its present easterly terminus at W. 45th St., to W. 25th St. The engineer has also recommended the expenditure of $50,000 for the grading of the new speedway.

East Palestine, O.—City Council has passed ordinances providing for the paving of Clark and Martin Sts., with brick or block. The work includes about 11,400 ft. Contract will be let early in the spring. C. E. Vaughn, of this city is engineer.

Sandusky, O.—City Engineer has estimated the cost of paving Franklin St., between Water and Monroe Sts., with brick at $28,000.

Youngstown, O.—City Council has passed resolutions to pave the following streets: South Ave.; Poland Ave., from South Ave., to Lansingville school; Foster St.; Scott St.; and Thomas St.; Mahoning Ave., between West Ave., and Mahoning Ave., viaduct; Duquesne St., between Edwards St., and Oak Hill Ave.

Altus, Okla.—City will soon hold an election to vote on the issuance of $20,000 worth of municipal improvement bonds.

Ardmore, Okla.—City is planning on doing about $350,000 worth of paving during the year. Commissioner W. R. Burnitt already has plans for 225,000 sq. yds. of asphalt.

Chandler, Okla.—City Council is contemplating on paving the new four mile Linwood boulevard with a combination of macadam and asphalt.

Chandler, Okla.—City Council has decided to construct lateral storm sewers in the following streets: Fifth St., from the east side of Manvel Ave., to the east side of Blaine Ave.; Ninth St., from the west side of Price Ave., to the west side of Cleveland Ave.

Hobart, Okla.—City will soon hold an election to vote on the issuance of $90,000 worth of public improvement bonds.

Oklahoma City, Okla.—City Council has declared it necessary to grade Kelham Ave., from a point 144 ft. north of the north line of Granger St., to the north line of Alice St.; Granger St., 11th St., and Park Place from the east line of Kelham Ave., to the west line of Clark St., and Alice St., from the west line of Clark St., to the west line of Delaware Ave.

Oklahoma City, Okla.—City Council has declared it necessary to pave the East and West alley in block 47.

Albany, Ore.—The project to park several of the leading streets in the residence district of the city, preparatory to paving next summer was defeated in the city council. Plans are underway for the paving of Ferry, Broadalbin and Ellsworth St.; Third and Fourth are under consideration.

Portland, Ore.—Plans have partly been made for the construction of 75 miles of bitulithic, asphalt, Hassam and stone block pavement. The work is to be done on a concrete foundation; cement gravel will be used as a filler and concrete curb built. Contracts will probably be let during this winter. J. W. Morris, city hall, is engineer. T. M. Hurlburt, city hall is the official in charge.

Scranton, Pa.—Resolution has been introduced in the city council for the laying of an asphalt pavement on Sanderson Ave., from Market St., to Race St. From Race St., the proposed paving will go to Shawnee Ave., thence to Pond St., from Pond to Dean, and thence to North Main Ave.

Woonsocket, R. I.—City Council has passed a resolution to construct a highway from River St., to the Blackstone River.

Cookeville, Tenn.—City recently held an election to vote on the issuance of $30,000 worth of municipal bonds.

Denison, Tex.—City has voted the issuance of $260,000 worth of good roads bonds.

Alexandria, Va.—The county of Alexandria will soon pave four squares on King St., at a cost of about $18,000.

Leesburg, Va.—The Leesburg-Washington Turnpike Co., is to be incorporated with a capital stock of $150,000. The object is to macadamize the old Georgetown-Leesburg turnpike and maintain it by a system of tolls. John G. Hopkins, Ashburn, is president; E. R. White, vice president, and Westmoreland Davis, Morven Park, is secretary.

Norfolk, Va.—Board of Control has announced that estimates are in preparation for a new pavement on Granby St.

Norfolk, Va.—Ordinance appropriating $5,925 for the paving of Main St., has received the Mayor's veto, because it would leave less than $10,000 as a public improvement fund for Berkley ward.

Spokane, Wash.—Following paving contracts will be let this spring providing the ordinance for the changing of the period of maintenance bonds to be furnished by street-paving contractors from 10 to five years is passed: A mile of paving on Broadway west of Monroe St.; Grand St., from Ninth Ave., to 29th Ave.; seven blocks on North Monroe St., to Division St., and avenues in Browne's addition, and the paving of Perry St., on Cannon Hill.

Spokane, Wash.—City Council has passed a new ordinance to pave Howard St., from the Spokane river to Spofford Ave.

Tacoma, Wash.—City Engineer Raleigh has had a gang of surveyors at South Tacoma running lines for the proposed pavement of Union Ave. The avenue is to be 75 ft. wide.

Grafton, W. Va.—City will soon hold an election to vote on the issuance of $110,000 worth of municipal improvement bonds.

Sewers.

Items Arranged Alphabetically by States.

East San Jose, Cal.—Board of Trustees has accepted the plans and specifications prepared by town engineer J. E. Fisher for the proposed sewer system.

Los Angeles, Cal.—City Engineer is busy with plans for extending the sewer system to sev-

eral sections of the new territory in the Wilshire and Sunset boulevard districts.

Greeley, Colo.—City Council has ordered the extension of the sewer system in this city.

Canton, Ill.—Drawings and specifications for the rebuilding and enlarging of the sewer system for this city are being made by A. T. Maltby of Chicago, Ill. Mr. Rudolph Meisinger of Pekin, Ill., will probably superintend the construction work.

Sterling, Ill.—City Engineer J. D. Arey has been instructed to prepare plans and the estimate of the cost of the proposed extension of the sewer system on Dixon Ave.

Grinnell, Ia.—Guy E. Smith of Indianola was low bidder for the construction of the storm sewer in North Grinnell. The sewer is to be 5,530 ft. long, with 15 manholes. Mr. Smith's bid was $4,662. The contract was not awarded on account of a technicality which will soon be complied with.

Missouri Valley, Ia.—Plans and specifications for the proposed sewerage system for this city are being prepared by the Iowa Engineering Co., of Clinton, Ia.

Webster, Ia.—City Council is planning on constructing a sewer along the alley of Second St., from Third St., to the river for the purpose of draining the business district of the city.

Louisville, Ky.—C. T. McCracken & Co., Columbus, O., was the lowest bidder for the construction of the Jane St., sewer, Sewer Contract No. 59, of the comprehensive system of sewerage for this city. The work will include the following approximate quantities: 3,460 ft. of 8 to 33-in. sewer and drain from 4 to 17 ft. deep; 1,300 cu. yds. of rock excavation; 700 cu. yds. of concrete; 5,700 ft. of vitrified pipe from 8 to 24-in. J. B. F. Breed is Chief Engineer.

Greenfield, Mass.—Preliminary plans are being made for the proposed new intercepting sewer at an estimated cost of from $40,000 to $50,000. At present it is thought that the construction will not include a disposal plant. William S. Johnson, 101 Tremont St., Boston, Mass., is consulting engineer; George F. Merrill, Greenfield, Mass., is the chairman of the committee appointed to investigate sewage disposal.

Sedalia, Mo.—Plans and specifications for the construction of a sewage purification plant at this city are being prepared by Burns & McDonnell, Scarritt Bldg., Kansas City, Mo.

New Brunswick, N. J.—The mayor has named an advisory sewage disposal commission to consider the problem of changing the sewage system of this city to avoid pollution of the Raritan river.

Paterson, N. J.—An estimate of the cost of the proposed sewer system for the Lakeview section of the city has been prepared by Engineer Harder. The board of public works is in favor of the construction of the sewer.

North Tonawanda, N. Y.—Board of Public Works accompanied by City Engineer A. P. Smith, visited Ithica for the purpose of obtaining information and a demonstration of both the centrifugal and Shone systems of lift pumps. It is planned to install one of these systems in this city.

Waterville, N. Y.—C. A. Holquit, chief engineer of the State Health Department, has investigated the sanitary conditions in this city, and states that unless the city prevents the pollution of the stream which runs through the village, they will have to build a public system of sewers.

Grand Forks, N. Dak. — A tunnel will be built under the Great Northern right of way for a distance of 250 ft., for the DeMers Ave., sewer main so that the sewer may be perfectly safe and not subject to danger of being crushed by the weight of heavy trains above. The tunnel will be about seven ft., in diameter and the sewer main will be 23 ft., beneath the surface.

Cincinnati, O.—County Commissioners have been petitioned to build a trunk sewer in Millcreek, from Glendale to the Ohio River.

Greenville, O.—City Council has authorized the board of control to employ an engineer to prepare plans and specifications for a sanitary sewer disposal plant for this city.

Hamilton, O.—An ordinance has been presented to the city council for the construction of certain sanitary sewers in the Third ward.

Sandusky, O.—City Council has been asked to construct a 15-in. tile sewer on McKelvey St., instead of the old 9-in. tile sewer now there.

Steubenville, O.—City Council has decided to construct a sewer in Edgar Ave., for a distance of 250 ft., and in Spring Ave., from South and Spring Ave., to Elm St.

Youngstown, O.—City Council has passed the following resolutions: To sewer and build outlet in Frederick Ave.; to sewer Buckeye St., between Hillman and Garlick Sts.; to sewer Garlick St., between Tremont and Weldo Sts.; to sewer Cypress St.

Cherokee, Okla.—City Attorney Sam Halstead has asked the government for permission to run the sewer mains of this city to the great Salt Plains and use a portion of them as an outlet. The piping to the plains will be commenced as soon as the permission is obtained.

Oklahoma City, Okla.—City Council has declared it necessary to construct manholes and catch basins and to put in inlet pipes, lateral storm sewers, curbs and reset curbs in East and West alley in block 47.

McKeesport, Pa.—City Council has decided to appropriate $4,000 for the city engineer to employ assistants in preparing sewer plans for the city as demanded by the state board of health. J. Munroe Smith is city engineer.

Columbia, S. C.—The street committee of the city council has authorized the construction of a storm sewer on Cherokee St., to Weston and Booker at an estimated cost of $2,661.

Austin, Tex.—A report will soon be submitted to the city council estimating the value of the property of the Austin Sewerage Co., with a view to its purchase by the city.

Richmond, Va.—Following construction work has been authorized by the city council: Sewer, in alley between Leigh and M Sts., at $593; sewers in 33rd and other streets, amounting to $26,989; sewer in 31st St., from M to P to cost $1,500; sewer in Winder St., to cost $800; and a number of sewers in Fulton to cost $22,657.

Richmond, Va.—City Council has approved the plans and ordered the construction of the first section of the Dooley Ravine sewer, from James River, under the Chesapeake and Ohio Ry., and under the James River and Kanawha canal; estimated cost $60,000.

Water Supply.

Items Arranged Alphabetically by States.

Aplington, Ia.—Citizens of this place are agitating the installation of a water works system for the city.

Corydon, Ia.—The installation of a complete water works and sewerage system for this city is being agitated.

Delmar, Ia.—A petition is being circulated asking the town Council to call a special election for the purpose of voting bonds for the extension and improvement of the water works system.

Grinnell, Ia.—City Council is to be petitioned to hold a special election for the purpose of voting a bond issue of $15,000 for the improvement of the water works plant.

Leon, Ia.—City has voted to install a system of water works.

Boise Barracks, Ida.—An appropriation of $40,000 has been granted by the War Department, Washington, D. C., to Captain Ryan, Constructing Quartermaster, for securing additional water supply.

Bloomington, Ill.—City Water Board has decided to readvertise for bids for the enlargement and improvement of the water works station. Bids were formerly advertised for on Dec. 28.

Rockford, Ill.—City Water Works Committee is now considering the installation of larger water mains throughout the city.

Vermont, Ill.—Town has issued bonds for the purpose of installing a water works system.

Canton, Kan.—A movement is on foot in this town leading toward the installation of a water works and electric light system.

Wichita, Kan.—City has under consideration a plan to purchase the present water works system at a cost of approximately $1,000,000.

Saginaw, Mich.—City Council has passed a resolution calling for a new water plant in Saginaw and an election is soon to be held to vote on issuing $500,000 worth of bonds for the purpose.

Hibbing, Minn.—Water and Light Commission has decided to improve the water works system, which at present is inadequate.

Chouteau, Mont.—Steps are being taken providing for the construction of a water works system. Carl Tschepen, Havre, Mont., is seeking a water franchise.

Manchester, N. Y.—Citizens are anxious that a system of water works be installed and a proposition to bond the village for $25,000 for that purpose is to be submitted to the voters.

New York, N. Y.—The State Water Board is to hold a meeting Jan. 11 at New York, for the purpose of considering the plan for constructing a tunnel under Manhattan for the Catskill System as proposed by the New York Water Board. The estimated cost of the work is $25,000,000.

Morehead City, N. C.—W. J. Hales, Secretary, will sell bonds amounting to $20,000 for water works on Jan. 17, 1910.

Altus, Okla.—City Council has decided to hold a special election to vote on issuing bonds amounting to $200,000 for the purpose of extending the municipal water and electric plant and the sewer system.

Foss, Okla.—The proposition to issue $29,000 worth of bonds for the construction of a water works system was carried.

Davis, S. Dak.—City has under consideration the matter of installing a municipal water works system and it will probably be submitted to the voters at the early Spring election.

Dallas, Tex.—Plans and specifications have been approved by the Consulting Engineer, for the White Rock Reservoir, dam and pumping station and Board of Municipal Commissioners will probably call for bids for the work in the near future.

Merkel, Tex.—Preliminary surveys have been completed for the city water works system and construction work will be started soon.

Sherman, Tex.—City voted at a special election to the issuance of bonds amounting to $12,000 for the extension of the water works system.

Vernal City, Utah.—Contracts are to be let within 60 days for the installation of a new water works system, estimated to cost $24,500. The canal will be used as a source of supply. Gray & Grosh, Salt Lake City, Utah, are the Engineers. Benjamin Kelly is City Recorder.

Martinsburg, W. Va.—City recently voted to issue bonds amounting to $40,000 for the purpose of extending the present water works system.

Oshkosh, Wis.—Resolution has been adopted instructing the mayor to appoint a committee to outline a plan for the construction of a new water works plant for the city.

Racine, Wis.—City has under consideration the matter of installing a municipal water works system.

TRADE NOTES.

Mr. Warren Wood, proprietor of the Wood Drill Works of Paterson, N. J., is in Chicago, and can be found at the company's offices, 5108-5110 West Lake St., Chicago, Ill.

The Arthur Koppel Co. has been consolidated with the Orenstein & Koppel Co., and the new corporation will be known in the future as the Orenstein-Arthur Koppel Co. The combined corporation has a capital of $6,500,000, with a surplus of $2,000,000, and is said to be the largest company in the world for designing, installing and manufacturing of narrow gage railways, viz: Portable railways, industrial railways, narrow gage sidings, narrow gage public railways and railway equipments of all kinds. One of the specialties of the company is the study of the individual transportation problem. They also act as consulting engineers to render their customers all the assistance required. The capacity of the plant built a few years ago at Koppel, Pa., has been enlarged in order to meet the increased demand of the products.

The Strauss Bascule & Concrete Bridge Co., Chicago, Ill., report the following orders taken during the past year: Railway Bridges—Florida East Coast Ry., at Ft. Lauderdale, Fla., over New River, 63 ft. 6 ins., single leaf, single track. National Transcontinental Ry., at Winnipeg, Man,. over Red River, 129 ft. 6 ins., single leaf, double track. Peoria & Pekin Union Ry., at Peoria, Ill., over Illinois River, 160 ft., single leaf, double track. Erie R. R. Co. (New York Division), over Hackensack River, 152 ft., single leaf, double track. Cape Cod Construction Co. (for N. Y., N. H. & H. R. R.), over Cape Cod Canal, 160 ft., single leaf, double track. Erie R. R. Co. (N. Y. S. & W. R. R.), over Overpeck Creek, at Little Ferry, N. J., 55 ft. 5 ins., single leaf, double track. C. & W. I. R. R., at Chicago, Ill., over Calumet River, 186 ft., single leaf, double track. Canadian Northern Ry., at Winnipeg, Man., over Assiniboine River, 92 ft., single leaf, double track. Niagara St. Catharines & Toronto Ry., over Welland Canal Feeder, 46 ft. single leaf, single track. Northern Pacific Ry., over Duwamish River, at Seattle, Wash., 160 ft., single leaf, double track. Highway Bridges—City of Ottawa, Ill., over Illinois River, 118 ft. single leaf. Cape Cod Construction Co., at Buzzards Bay, Mass., over Cape Cod Canal, 160 ft., single leaf. Department of Rys. & Canals, Canada, over Trent Canal, at Lindsay, Ont., 73 ft., single leaf. City of St. Petersburg, Russia, over Neva River, 200 ft., clear span bascule, double leaf. The Palace Bridge at St. Petersburg will require a number of years in its construction, being an unusually monumental work. The remaining bridges will probably all be in service by next spring, including the C. & W. I. R. R. bridge across the Calumet River, which will be a single leaf structure of unusual proportions. There are also now nearing completion the Polk Street bridge for the city of Chicago, the Walnut Street bridge for the city of Green Bay, Wis., and the Illinois River bridge for the city of Ottawa, Ill., which will make the total number of Strauss Trunnion bridges in active service 13. Of these the 170-ft. double track, single leaf bridge for the C. & N. W. Ry. at Kinzie St., Chicago, which was put in service during the month of September, 1908, has an average record of 1,000 bridge movements per month and of 1,100 train movements per day. Since this bridge was put into service at a moment's notice and without any preliminary trying out, this is evidence of extreme efficiency. In a recent test it was found that the average horsepower required for the operation of this structure was 30, with a minimum of 14 and a maximum of 78.

Percentage Bidding as Viewed by the Contractor and the Engineer.

The evils of unbalanced bids have been a fruitful source of discussion. Many suggestions have been made to overcome or minimize the dissatisfaction invariably consequent upon the discovery that a contractor has so unbalanced a certain bid that his resulting profit has been more than the other party to the contract deemed proper. What has seemed to many engineers of experience a good method to enable an analysis of bids to be made, has been the percentage method now used in a number of cities.

The percentage system calls for more care in the preparation of estimates on the part of the engineer than is customary before its introduction. It reduces to a minimum the office work involved in the comparison of bids received and each bid is subjected to a careful analysis. Briefly, the engineer prepares careful detailed estimates with 100 per cent unit, item, or total costs. Before the present era of the study of methods and costs by engineers such estimates would have been of little value, for engineers were then chiefly concerned with design. The present day engineer is a technically trained business man, whereas in former years he was a technically educated scientist. Instead of the contractors submitting unit or item bids for work, they bid, under the percentage system, a plus or minus per cent of the engineer's estimated 100 per cent costs.

The percentage system of bidding has become popular with engineers. It is claimed by many that it is a good system and has enabled engineers in the necessarily hurried study of bids before award of contracts, to protect themselves against overlooking many apparently unimportant items. Some contractors claim it has eliminated an undesirable class of guessers and is thus good for the contractors as a whole, while other experienced contractors claim it has led many to go into contracting who rely entirely upon the engineer's estimates and bid accordingly. This last objection has from time immemorial been urged against preliminary estimates.

The General Contractors' Association of New York city has recently issued a brief embodying suggestions for changes in sewer specifications from which the following section relating to percentage bids has been taken:

Seventh—We would ask that the percentage system of bidding on work be abolished for the following reasons:

It does not insure an unbalanced bid unless it could be assumed that the estimate of quantities as made up by the engineer, together with his estimated cost, were absolute and accurate. We feel that a contractor of experience is better enabled to estimate the cost of work than the engineer, whose ideas of cost must be largely a matter of conjecture. It would permit of irregularity in unbalancing the estimated quantities by the engineer preparing the estimate (should he be unscrupulous) and enable him to work in collusion with a favored bidder. By the ordinary system of bidding item by item it is possible, where such a condition of unbalanced quantities exists, to so arrange the prices on the various items—reducing that on an overbalanced item and increasing the price on some other item which will cover it in accordance with the original quantities—as to reimburse the bidder for the loss which he will sustain on the overbalanced item. With the percentage system, however, the bidder has no opportunity along that line, as his average percentage price is applied uniformly to the engineer's 100 per cent standard, and if that standard be too low or too high in any particular item or items the bidder has no recourse but to follow the ratio designated by the engineer and must make his percentage sufficiently high to safeguard himself, which course makes his bid higher than it would be were the quantities properly stated by the engineer. It is claimed that the percentage system of bidding prevents unbalancing by the contractor; but it would seem possible for the engineer to detect an unbalanced bid quite as readily by the system of item bidding, as he could apply his uniform standard in comparison with the contractor's scale of prices and satisfy himself whether the latter were unbalanced. The fact that the engineer has established the 100 per cent basis for bidding might be assumed by the uninformed that such standard was sufficient and that prices should never exceed the engineer's limit. We submit that the engineer is not in a position to make the careful estimate of cost that the contractor must make in submitting his bid for the work. The engineer is apt to assume that certain fixed standards will meet all conditions, which is not true in all cases, and may result in an unbalanced estimate as the standard. The contractor in estimating a piece of work would figure it item by item and compare his total cost with the engineer's 100 per cent allowance regardless of the fact that his scale of cost may not correspond in ratio in every respect with those given by the engineer. It is impossible, therefore, to tell whether on the completion of the work the quantities will have been justified, and as a matter of prudence he will be inclined to increase his figures to cover the contingency.

Without taking sides we incline to the belief that the arguments presented by the contractors are not cogent. The admission is made that the engineer will likely employ his 100 per cent standard in comparing bids; it is also admitted that contractors will compare bids before submission, with the engineers' 100 per cent standard. The argument against the percentage method is, therefore, resolved into little more than a mere statement that the contractors do not like it.

As in all such protests some ground exists for the protest and in this one the men making it have failed to present some essential fact on which they apparently agree but cannot adequately present.

Engineer Department Heads in New York City.

The new city administration of New York headed by the Hon. William J. Gaynor as mayor has signalized the inauguration of its work by the appointment of engineers as heads of several of the most important city departments. It is worth while to note the list. As head of the Department of Docks is Mr. Calvin Tomkins, an Associate of the American Society of Civil Engineers and a man prominent in the engineering industries. The new Commissioner of Water and Gas Supply is Mr. Henry S. Thompson for many years the head of the well known building contracting firm of Thompson-Starrett Co. As head of the Bureau of Buildings of Manhattan is Mr. Rudolph P. Miller, M. Am. Soc. C. E., a man unusually well qualified by experience and in technical attainments for the position. The great Department of Bridges with its unusual demands for technical and executive ability is placed under the direction of Mr. Kingsley L. Martin, M. Am. Soc. C. E. This engineer who entered the department a dozen years ago in a subordinate position has earned promotion step by step until now he is made its head.

It is so rare that even a single city department in New York or in any large American city has an engineer head that this list of appointments from the engineering field is notable. The question naturally arises, is it of any general significance? In a word, does it signify merely the individual notion of the new mayor of the great eastern metropolis as to the kind of training that best fits men to direct city public works or is it evidence of a growing public opinion? We cannot feel altogether confident that the last alternative is the true answer, but recent events are not without evidence that it may be.

The city of Boston, as we noted in our issue of Nov. 24, 1909, has by popular vote revolu-

Copyright 1910, by the Myron C. Clark Publishing Co. All rights of republication reserved.

tionized its city government largely because of the disclosures that have been made of the inefficiency of its politician department heads. Just now the city of Chicago is in the midst of a public investigation which is every day adding fact upon fact proving the gross incompetence, if no worse, of its politician heads of departments. Engineers know, largely through our columns alone we may remark incidentally, what conditions of incompetency, carelessness, extravagance and veniality were disclosed in Boston. The Chicago investigations have not progressed so far, only fragments of the Merriam commission's discoveries have found their way outside of the committee rooms, but the little that is known indicates a condition of affairs no whit better than that disclosed by the Boston Finance Commission.

The important fact of these investigations in Boston and in Chicago is not wholly that incompetency and extravagance has been proved—both these and a certain measure of rascality were long ago known to exist; it is that the people have put their city servants on trial. Incidentally, whenever this trial has been pushed to a decision the politician heads of departments have been convicted. It is not perhaps without significance too that the evidence which secured conviction was evidence collected, analyzed and presented by engineers. This was the case in Boston as we have demonstrated in many pages of text and cost data published during the last few months. It will be found to have been the case in Chicago, also, when the work of the engineers of the Merriam commission comes to be made public. We shall go even further and say that no one but engineers could have searched out so wisely and presented so forcibly this evidence. These things are the business of the engineer, just as much as are the computation of strains and the marking of lines and levels with which alone he is associated in the public mind. Indeed, they are even more his business.

This journal has advocated the appointment of engineers to direct, as responsible heads, the public works departments of our cities. It has further advocated that in every large city at least there should be a review board composed largely of engineers to review, to criticise and to suggest improvements in the work of these department heads. The direction of a city's street department, or sewer department, or water supply department, or bridge department is a work of management engineering. The engineer fitted to be at the head of great works is to-day a management engineer, something more than a technician but none the less a man of technical attainments. There are such engineers, scores of them, and it is they who should handle our city public works.

The city of New York has begun a regime of engineer management of public works. Several of its most important bureau heads are men who have gained prominence in the engineering field. Their success or failure in their work will signify much to engineers. Engineers the country over can but be gratified that their profession has been so generously recognized. It is our belief that this recognition will have been proved justified when the time comes to take account of work done.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Reducing Contraction and Absorption of Concrete by Mixing it with Mineral Oil.

BY ALBERT MOYER.*

The mixing of oil (mineral) with concrete is very simple. The oil, alkalies and water will form an emulsion becoming thoroughly incorporated in the concrete. If the concrete is to be mixed by hand, proceed as usual and after the water has been added and the resulting mass turned and raked, add non-volatile mineral oil in proportion of 10 to 15 per cent of oil to the weight of the cement. Turn the concrete with shovels two or three times, raking while turning; the oil will quickly emulsify and become thoroughly mixed in the concrete. If machine mixing is employed, use a batch mixer, turning a sufficient number of times thoroughly to mix the cement, sand, crushed stone or gravel and water. Then add 10 to 15 per cent of non-volatile mineral oil and turn again the same number of times as it required to mix the concrete. The oil will quickly emulsify and become thoroughly incorporated in the concrete.

Oils added to concrete in proportion of from 5 to 15 per cent will slightly delay the initial and final set. Increasing the proportions of oil will further retard both the initial and final set and hardening, but up to 15 per cent from experiments so far made, it would seem that the retarding of hardening will not be sufficient to cause the work to be uneconomical. The tensile strength will necessarily be reduced, and with the increasing percentage of oil toughness will be slightly diminished but not in proportion to the increase in the percentage of oil used.

An extremely interesting paper (Eng.-Contg., Jan. 5, 1910) was read at the meeting of the Association of American Portland Cement Manufacturers, New York, Dec. 15, 1909, by Logan Waller Page, Director Office of Public Roads, Agricultural Department, Washington, D. C., on the subject of the "Possibilities of Portland Cement as a Road Material," in which he described some investigations being carried on by Dr. Allerton S. Cushman in the Laboratory of the Office of Public Roads to ascertain the practicability of mixing semi-asphaltic base oils with Portland cement concrete, with the object of obtaining the desirable properties of both Portland cement and asphaltum. So far only pats and briquettes have been made; the results so far obtained show ample strength for ordinary work; 6-in. cubes will be tested later. It is believed that compression tests will show greater strength than the usual relation of compression to tension. This is a matter for further investigation, and it is to be hoped that chemists and cement testers will actively take up this work and carry on investigations covering long time periods.

Tensile strain tests should be discarded. Such tests have now been discovered by the German Portland Cement Manufacturers and compression tests substituted. With the increased scientific knowledge and the consequent better material produced by Portland cement manufacturers, tensile strain tests have become obsolete, and owing to the brittleness and extreme sensitiveness of neat Portland cement, the unscientific methods employed in tensile strain tests, the personal equasion involved, tensile strain tests do not indicate the possible load which Portland cement concrete may carry.

I, therefore, would earnestly advocate compression tests on cylinders of a size which will cause the area to equal 6-in. cubes. In order that such tests may be standardized and relative, standard sand should be used, and if possible a standardization of gravel or crushed stone. If crushed stone, trap rock should be used, all passing through a ¾-in. mesh and all collected on a ¼-in. mesh. Mix up cylinders which will theoretically figure maximum density, add varying proportions of oil from 5 to 20 per cent. Also make up another set of cylinders adding proportions of hydrated lime, from 10 to 30 per cent, increasing the percentage of oil with the increase of hydrated lime. The addition of hydrated lime theoretically should permit the addition of a larger percentage of oil, as we thus have a greater emulsifying material. Varying percentages of Portland cement may be used, always keeping the relation between the sand and stone the same, maximum density having been figured. The amount of Portland cement to be increased above that which is required to fill the voids in the sand.

Two months ago the writer made some briquettes and pats with the object in view of ascertaining, if the mixture of oil with wet neat cement and mortar would have the tendency of keeping all but the excess water from leaving the wet neat cement of mortar. Briquettes were made, neat cement mixed with water, the water slightly in excess of that usually required, after which 10 per cent of oil petrole was added. (Oil Petrole is a white non-volatile petroleum product of about the consistency of melted vaseline). Pats were made of 1 part cement and 3 parts sand, mixed with water a little in excess of what would ordinarily be used, after which 10 per cent of the same oil was added. These pats are about 2½-ins. in diameter and a ¼-in. thick.

As soon as made the pats were left in dry air. The initial and final set was found to be normal. They were never immersed in water but remained in dry air for several weeks. No cracks occurred and they became so hard and strong that they were very difficult to break by the use of the fingers and thumbs. After remaining in dry air for three weeks, they were put out in freezing temperature for three days, and again placed in dry air over the radiator. No cracks or checks have occurred.

After remaining in dry air for a month, a test for absorption was made. A broken pat was weighed dry and found to weigh 94-64 oz. It was then immersed in water for several hours. Upon removal from the water, the surface was quickly removed with blotting paper, the pat immediately weighed and found to weigh 99-64 oz. Only 5-64 oz. of water was absorbed.

The fact that the pats were never immersed in water and showed no evidence of checking or cracking, and became hard, would indicate that the emulsified oil had held the water in the mortar and that such mortar was, therefore, both non-evaporative and non-absorbent, which would tend to show that concrete in which mineral oil has been mixed would not be likely to contract and therefore contraction cracks would be avoided.

Under the theory of Prof. Bauschinger, which has been demonstrated by Prof. Swain in the laboratory of the Massachusetts Institute of Technology, neat cement when set and hardened in air contracts and this con-

*Fifth Avenue Bldg., Madison Square, New York.

traction increases with age up to a certain period, possibly six months or a year. A mortar of 1 part Portland cement and 3 parts sand, hardened in air, shows contraction but less in proportion than neat cement. The results also prove that neat cement when hardened under water shows a slight expansion, while mortar composed of 1 part Portland cement and 3 parts sand, hardened under water, shows expansion but less in proportion than the neat cement. Reducing these conclusions to figures and taking the average results obtained by various authorities, figuring the expansion and contraction by percentage the following are the results:

Neat Portland cement hardened in air at the end of 16 weeks shows 0.15 per cent contraction.
1 to 3 mortar hardened in air at the end of 16 weeks shows 0.05 per cent contraction.
Neat Portland cement hardened under water at the end of 15 weeks shows 0.05 per cent expansion.
1 to 3 mortar hardened under water at the end of 16 weeks shows a 0.015 per cent expansion.

Mixing oil with concrete, judging from the meager tests so far made, would seem to indicate that the oil held the water in the mortar keeping the cement particles wet and thus furnishing the same conditions as if set under water, hence very materially assisting, if not altogether obviating contraction cracks and hair cracks or crazing. Furthermore, the resulting mortar appears to be far less brittle and therefore such treatment should admirably serve the purposes required of concrete retaining walls, foundations enclosing cellars, tanks, cisterns, etc.

Exhaustive tests have been made by a number of authorities on the action of oils on concrete. The effect of oil on concrete and the effect of oil emulsified in concrete are two separate and distinct subjects.

We are informed by reliable authorities that concrete immersed in animal or vegetable oils will in time disintegrate and that concrete immersed in mineral oils is unaffected. In the first instance there was no chance for the oil to emulsify, in the latter the oil is separated into minute globules. A large field of usefulness is ready for oil mixed and emulsified in concrete. The emulsion takes place after the oil is mixed with the wet concrete and not before as has been done in a patented article.

A mere casual glance at the uses of Portland cement concrete would indicate that oil mixed with the concrete would prove very desirable for dustless waterproof floors for office buildings, for slaughter house non-absorbent floors, impervious concrete drain tile and sewers. If the experiments to be carried on in the future prove that mineral oils in the course of time are not disadvantageous, the drain tile problem has been solved, for there can be no action of the alkalies or other injurious elements to non-absorbent, dense and impervious concrete.

Such concrete will be particularly desirable for silos. Some of the acids formed by the silage in the bottom of the silo would probably not attack a dense, non-absorbent, impervious concrete.

Contraction cracks will be eliminated in cisterns, drinking troughs, live stock feeding floors and platforms. Some objection may be raised to the use of oil mixed concrete from the standpoint of its liability to flavor the water or the food. If we stop to consider that the oil is divided into minute globules, thoroughly emulsified, we will see that while there may be some odor there is not likely to be any taste after the drinking trough, feeding floor or cistern has been in use for a few days.

Such oil mixed concrete will be effective for liquid manure cisterns for the reason above described. It will also be particularly adapted to terrazzo floors, the great objection at present being due to contraction cracks. A white oil may be mixed with Portland cement, white sand and water and used for the purpose of setting brick and stone; it being non-evaporative and non-absorbent no efflorescence or stains can occur. In fact, such concrete can be used in any work not requiring extraordinary compression strength, and in which the concrete does not come in contact with heat.

One of the particular advantages will be for stucco work, and exterior plasters. It would seem that this idea of mixing oil with wet mortar was novel and new, but like many discoveries it only proves to be a rediscovery. In the first century A. D., Marcus Vitruvius Pollio, the famous Roman architect, gives the following detailed specification for stucco. "A mixture of well hydrated lime, marble dust and white sand mixed with water, to which mixture is added either hogs lard, curdled milk or blood." In A. D. 1280 at Rockingham Castle, England, melted wax was mixed with the mortar. In A. D. 1324 in the work of King Edward II. at Westminster pitch was mixed with mortar.

The permanency of the Roman stuccoes may be partially accounted for by the use of oil mixed with mortar. Although Vitruvius used hogs' lard, an animal oil, the mortars have withstood the action of the centuries, and in places where freezing temperature occurs in winter and great heat in summer. However, the hogs' lard must have been very thoroughly emulsified by the action of the hydrated lime. Portland cement was unknown at that period. In this connection, I would like to suggest the following specification for stucco, the third or finish coat:

Use 1 part Portland cement, 20 per cent (volume of cement) of hydrated lime and 3 parts coarse white sand. First dry mix the sand and cement and with this mix dry hydrated lime turning each three times with shovels, rake while shoveling. Add water, turning and raking until the desired consistency is obtained. Then add 15 to 20 per cent of white oil petrole (Chesebrough Mfg. Co., New York), the oil to be by weight in percentage to the weight of the cement. A gallon of oil petrole weighs 7½ lbs. Apply this mortar while the scratch coat is damp and as soon as scratch coat is firm enough to stand the pressure or plastering. If it be desirable to tint the stucco color the oil with any lime-proof coloring matter, in proportion which by experiment with small samples is necessary to give the desired tint.

A white non-volatile mineral oil is suggested for stucco and for mortar to be used in setting white marble or light colored brick, on account of the color possibilities. For concrete where the color is not essential the heavy black bituminous oils to the light non-volatile petroleum oils are successful. They are cheap and their name is legion. Do not use oils containing organic matter and positively avoid, at least for the present and until further experiements have been made, vegetable or animal oils as they are liable to form an acid which in turn may disintegrate the concrete.

Lime, and animal oils have stood the test of centuries; Portland cement and animal oils have not yet had this opportunity. It is within the range of possibility that the test of time may prove contrary to the theory and animal oils emulsified be found not dangerous.

The Disposal of Sewage Sludge.

Mr. W. C. Easdale at a recent meeting in London, of the Institution of Civil Engineers made the following comments on the disposal of sewage sludge. The conversion of sludge into a marketable manure is a genuine disposal, in that the products are actually taken away and got rid of. The cost of the process is high and not entirely repaid by sale of the product. A general adoption of this process will lower the market price.

Depositing at sea is also a real disposal. It is only economical when handled in large volumes and at places where the sewage works are convenient to wharves. Pressing into cakes is not a real method of disposal. It can be done only with chemically treated sludge and is simply a method to facilitate transportation to lands wanting manure. If not quickly sold it becomes offensive and it has proven to be a difficult product to sell. Shallow burial in light porous soil is a cheap and effective method when the soil is dry. In wet weather this method may easily prove to be a nuisance.

Air drying, is also not a real method of disposal, but rather a preparation for disposal by spreading on land, either at the works or by the neighboring farmers. It consists of running the sludge on to draining beds and allowing it to remain there until it becomes dry enough to be removed by a spade. With drying beds of large area, suitably constructed, the author considers this method very satisfactory. Placing the sludge in thick layers in lagoons or over land not suitably prepared he considers unsatisfactory.

Running of sludge is a real method of disposal. It however involves pressing before mixing with house refuse and is only available where a refuse incinerator is in operation. Another fairly satisfactory method is that of mixing sludge with house refuse. The mixture dries at a fairly rapid rate, there is very little, if any, nuisance from smell, and the result is a good manure, easily handled, and suitable for sale to farmers.

In discussing the paper Mr. R. H. Jeffes gives as his opinion from actual experience, that land burial is the most efficient method of disposal, under proper conditions. His experience in pressing sludge and selling it has not been satisfactory. Mr. Henry C. Adams condemned the spreading of wet sludge on land unless all conditions were perfect. Mr. L. A. Dibdni believed the main efforts of sanitary engineers should be directed towards processes of sewage disposal which will produce no sludge or such small amounts that the disposal will be no problem. Mr. J. E. Farmer has to dispose of 33,000 tons of sludge each year and has found in his own experience that spreading on and ploughing into land is cheapest and best. Burning had been abandoned as too costly. Spreading 3 ins. thick on land was best. Mr. H. C. H. Sheriton believed with Mr. Dibdni that it is by no means necessary to have sludge. Mr. E. E. Ryder obtained the best results by shallow trenching. The discussion is to be continued in the Journal of the Institution of Municipal Engineers.

Election of Officers for 1910 of the Western Society of Engineers.

The ballots for the election of officers for the Western Society of Engineers for 1910, were canvassed on January 7, and the following officers were found elected: President, J. W. Alvord; first vice president, O. P. Chamberlain; second vice president, A. Bement; third vice president, W. K. Hatt; treasurer, A. Reichmann, and trustee for three years, W. W. Curtis.

During the year we have pumped 269,675,185 gallons of water; of this amount but 53,440,424 gallons, or twenty per cent, were metered or measured, leaving 216,234,761 gallons used under our guess work system. For the fifty-three million (in round numbers) gallons metered, we received $15,606, or twenty-nine cents per 1,000 gallons; for the 216 millions (in round numbers) gallons unmetered, we received $18,110, or eight cents per 1,000 gallons. This is a case where the economical man pays for the waste of his neighbor.—Extract from Annual Report of the Water Commissioners of the City of Dover, N. H.

We are well pleased with results since putting all consumers on meters. We have no trouble to furnish water and run our north pumping plant but half the time to keep our storage reservoir full all the time. This time last February it was impossible, with the amount of wells we had, to furnish water. The first month we put in our meters, most of our consumers used five times as much water as they have any month since. Meters have already been worth to the city all they cost.—C. V. Porter, Supt. of Water Works, Enid, Okla.

In 1903 Thomasville had about 250 consumers—125 of this number were metered. They pumped about 200,000 gallons per day. They now have 500 consumers, all of which are metered. They now pump about 200,000 gallons per day. They are selling water at 15 cents per 1,000 gallons, but the minimum charge is only 25 cents per month. The plant is on a good paying basis.—J. A. Epply, Supt. Water Dept., Thomasville, Ga.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Suggestions on the Design and Selection of Traction Engines.

At the annual meeting of the American Society of Agricultural Engineers, at Ames, Ia., on Dec. 27-28, 1909, Mr. W. F. MacGregor,* M. E., read a paper on traction engines from which the following points have been taken as of especial interest to engineers and contractors.

The author dwelt first upon the history of traction engines and then took up points of design and considered the elements entering into the ideal tractor. He believes these features might be about as follows:

(1) In the ideal traction engine the fuel cost must be low, and the fuel should be easily obtainable at any time in the local market.

(2) The ideal traction engine must be simple and reliable—that is, it must be always capable of delivering the required power.

(3) The ideal traction engine must be durable, for maintenance and depreciation must be counted in the cost of power delivered.

(4) The ideal traction engine would be safe against the danger of injury to life and property from explosion or fire.

(5) The ideal traction engine would be able to travel over anything in the way of roads or ground that it would meet. It would be able to negotiate steep hills, sand, gravel, soft ground, sloughs, wet clay, mud, snow, ice, etc., and also travel on pavements without injuring them. It would have wheels that would not slip on any surface and the engine would always be able to furnish whatever power was required to turn them.

(6) The ideal traction engine would be well balanced and would run steadily; that is, it would be able to maintain a constant speed whether running empty or under full load. This is necessary because the separators and some other machinery which it is required to drive can only do good work when run at an unvarying speed.

(7) The ideal traction engine would require only such attention from the operator as would be required to make it conform to the requirements. It would be easily steered and would turn as short as desired.

(8) The ideal traction engine for all localities should not require a great amount of water, for although this is usually plentiful, there are localities where it costs considerable to furnish it, and this cost must be counted in the cost of power delivered.

(9) In the ideal traction engine the cost of lubricants and miscellaneous supplies would be low.

(10) The ideal traction engine would be noiseless in operation.

(11) The ideal traction engine would be simple in construction, so that any one could easily learn to operate it.

(12) The ideal traction engine would be constructed so that the operator could easily manipulate it, and be protected from dust and weather.

When several manufacturers build a machine for a certain purpose year after year, they are obliged to a great extent to follow the demands of the purchasers and operators, who are naturally most intimately affected by the state of perfection of the machine. It is in short in the end simply a matter of the "survival of the fittest."

In the case of the steam tractor we may now begin to see some tendency toward a common type. The internal combustion tractors, on the other hand, being of more recent origin, naturally show greater variation in design and construction.

*Engineer for the J. I. Case Threshing Machine Co.

Today most of the leading builders of both steam and gasoline engines mount the engine on four wheels, the rear two of which are the drive or traction wheels, while the front ones are used to steer the engine. In a few cases a single front wheel is used. The weight is usually distributed so that from two-thirds to three-quarters of it is carried by the traction wheels. A certain amount of weight is necessary on the front wheels so that the engine may be steered when pulling, for the gearing then tends to lift the front wheels from the ground. Four wheel drive engines have been often proposed and sometimes built, one firm having manufactured them successfully for a number of years.

The "live" axle—that is, the system of mounting whereby the traction wheels are placed on an axle that turns—is gaining ground and we now find more manufacturers using it, for at least their larger engines, than ever before.

The throttling governor is universally used, and every close speed regulation has been obtained with it. The ideal speed regulation for driving a separator or other belted machine is to have a slight increase in speed with full load in order to make up for the slippage of the belts. Throttling governors are now made which will give ideal results in this respect, the speed increasing gradually with increase of load until at full load it is about 2 per cent faster than at no load. The automatic cut-off governor has been used on agricultural engines more or less in Europe, but very rarely in this country. The throttling governor dries and superheats the steam, and, used in connection with a valve gear which admits of "hooking up" to vary the point of cut-off according to the load requirements, gives good results in economy of steam consumption.

Table I gives some data of current practice in steam traction engines by leading manufacturers in the United States:

TABLE I. SHOWING RATIO OF STROKE TO BORE, NORMAL ENGINE SPEED, PISTON SPEED AND RATE OF TRAVEL OF 118 ENGINES OF THE DIFFERENT SIZES BUILT BY FIFTEEN LEADING MANUFACTURERS.

Make of engines	Average for different sizes of each make.	Ratio of stroke to bore.	Normal engine speed R.P.M.	Piston speed feet per min.	Rate of travel, miles per hour.
1	6	1.352	257.0	462.0	2.205
2	9	1.190	241.4	402.6	2.313
3	6	1.231	223.3	390.5	.....
4	12	1.410	236.6	412.4	2.152
5	7	1.215	251.4	405.9	.....
6	12	1.403	247.0	456.3	.....
7	2	1.250	220.0	366.0	2.100
8	9	1.373	256.4	474.3	.....
9	6	1.363	227.5	441.7	.....
10	6	1.285	232.5	406.2	2.170
11	10	1.288	247.5	461.5	.....
12	7	1.236	240.7	412.4	.....
13	6	1.117	246.7	431.0	2.498
14	5	1.108	240.0	416.0	.....
15	5	1.718	238.0	414.2	.....
Total ...	118				
Minimum		1.00	200	246	1.67
Maximum		2.18	300	537	2.63
Average		1.313	240.6	423.5	2.239

The figures in the columns of the table are obtained by averaging the various sizes of engines built by each of the 15 manufacturers. The minimum and maximum given at the bottom of each column, however, in each case show the extreme of any one size, while the averages at the bottom are the averages of all sizes and all makes represented, and consequently are not necessarily the same as any figure in the column above. These figures are given not only as illustrating the general practice along certain lines, but also because some of the figures are interesting in connection with the points brought up later on.

There are a few traction engines which differ quite widely from the accepted type, but these have as a rule been built from some particular class of work and are not usually conceded to be suitable for general use in various localities. Among these are the Best and Holt engines, which are built on the Pacific coast, primarily for hauling combined harvesters, but are also used to some extent for plowing, working the soil, and for hauling logs, ore, etc. These engines are quite large, some being rated as high as 110 horse power. When required, the boilers furnish steam for an auxiliary engine to drive the header and traveling thresher. Although built for similar purposes, these two makes differ considerably in construction, as one has an upright boiler, while the other has a horizontal boiler, one has a single engine, while the other has a double engine, and one is chain driven, while the other is gear driven. Both ordinarily use crude oil for fuel. Both use a single front wheel, having traction wheels of large diameter (7 to 9 feet), and have wide tires, widths of 4 or 5 feet being common. One of these manufacturers has built special engines with the traction wheel tires 13 and even 16 feet wide.

A discussion of the traction engine at the present time is not possible without some reference to the relative merits of the steam and internal combustion engines, but it is not the purpose of this paper to attempt to show which of the two is more nearly ideal. In such a comparison, all of the factors which go to make up the ideal engine as outlined must be taken into account and this is difficult, for the experience of one operator varies widely from that of another. In fact, the personal element of the operator enters so largely into the question that in many cases it is the deciding factor in determining the reliability, the durability, the cost of attendance, the cost of maintenance, and it usually determines to a more or less extent its ability to travel over bad ground or difficult places, its safety and the amount of lubricants required.

The fuel cost is always an important item, except when it is straw that is otherwise of no value, and it is sometimes the deciding element. It is well known among engineers that the internal combustion engine is capable of, and in fact gives, a higher thermal efficiency than the steam engine, but this is ordinarily of little interest to the purchaser. What is of vital importance to him is the actual cost of the fuel per unit of power delivered at the belt or at the draw bar. It should not be difficult to obtain this, but one obstacle in the way of so doing is the lack of a uniform unit of power, or rather the lack of uniformity in the popular conception of the unit of power among users.

In obtaining fuel costs and in selecting an engine for a given purpose, the intending purchaser of a traction engine is confronted by a very confusing problem on account of the differences in the methods of rating by the various manufacturers. Steam traction engines have been rated at from a half to a quarter of their actual horse-power, while internal combustion engines have been rated at figures more closely approximating their actual horse-power. Most manufacturers publish only the rated or nominal horse-power, although several now publish both rated and brake horse-power, and a few publish only the brake horse-power.

The actual horse-power as determined by the Prony brake-test is becoming better known, but ordinarily the purchaser has no means of applying this test. Consequently an uniform system of rating, based on the cylinder dimensions, pressure and piston speed is very desirable. It would not be a difficult thing to arrive at and it seems that the necessity for it is becoming more apparent each season.

As practice among builders of traction engines is not so uniform as automobile motor construction we cannot use the simple formula used by the Association of Licensed Automobile Manufacturers.

However, we may find comparatively simple

formulae which can be applied by most of the buyers or operators of these engines, which will give reasonably accurate results.

We will take the usual formula for indicated horse-power as determined by the indicator,

$$HP = \frac{P L A N}{33{,}000}$$

where

P = mean effective pressure,
L = length of stroke in feet,
A = area of piston in sq. in.,
N = number of power strokes per minute.

The "number of power strokes per minute" is twice the number of revolutions in the steam engine, and one half the number of revolutions per minute in the four-cycle internal-combustion engine. The area of the piston-rod of the steam engine is neglected in these calculations, but this does not materially affect the results. Practically all steam traction engines have the point of cut-off such that the mean-effective-pressure may be as much as one-half the boiler pressure. Now, we ordinarily have the boiler pressure expressed in pounds per square inch, the cylinder bore and stroke in inches and speed in revolutions per minute, so for simplicity we can write our formula in these terms and combine all of the constants. For indicated horse-power it then becomes practically as follows:

$$IHP = \frac{2 P L D^2 N}{1{,}000{,}000}$$

in which

P = boiler pressure,
L = length of stroke in inches,
D = diameter of cylinder in inches,

and

N = revolutions per minute.

In these engines the mechanical efficiency should be (and is under proper conditions) about ninety per cent., so we may write our formula for *brake* horse-power as follows:

$$BHP = \frac{18 P L D^2 N}{10{,}000{,}000} \qquad (A)$$

the characters denoting the same thing as before. This is for one cylinder and of course with double engines the result must be multiplied by two.

To show the way this formula applies to the engines as built by the various manufacturers, Table II is given. This table represents 17 different makes of engines, no one make appearing more than twice in the table. The "brake horse-power in public test" is given in a few cases taken from the Winnipeg and Brandon tests and is not necessarily the maximum power of the engine, as these tests were made principally to determine the fuel consumption, and in this case the load selected was naturally less than the maximum.

TABLE II.—HORSEPOWER OF STEAM ENGINES; TWENTY-FIVE EXAMPLES COMPUTED BY FORMULA COMPARED WITH HORSEPOWER BY OTHER METHODS.

Eng.	Rated H. P.	Cyl. bore (inches).	Stroke (inches).	No. of cylinders.	Steam pressure (lbs. per sq. in.).	Rev. per min.	Brake H. P. claimed.	Brake H. P. in public test.	Brake H. P. by formula.

25	36	7¾	14	2	165	235	120	105.5	117.4

We can use a formula similar to the one given for steam engines for internal-combustion engines, assuming as before an approximation for the mean-effective-pressure and mechanical efficiency. We may take these the same as in the A. L. A. M. formula for those figures approximate the actual conditions in well designed vertical engines in good order. However, we cannot eliminate the piston speed as was done in the A. L. A. M. formula for this varies considerably in the internal combustion motors of traction engines. Our formula is then (for one cylinder)

$$BHP = \frac{66 L D^2 N}{1{,}000{,}000} \qquad (B)$$

in which

L = length of stroke in inches,
D = diameter of cylinders in inches,

and

N = number of revolutions per minute (4 cycle).

For multiple cylinder engines, multiply the result obtained by the number of cylinders. To show the ways this formula applies to engines built by various manufacturers, Table III is given for vertical gasoline engines.

TABLE III. — HORSEPOWER OF VERTICAL GASOLINE ENGINES; SEVEN EXAMPLES COMPUTED BY FORMULA COMPARED WITH HORSEPOWER BY OTHER METHODS.

Eng.	Cyl. bore (ins.).	Stroke (ins.).	No. of cylinders.	Rated horsepower.	R. P. M. rated.	Brake H. P. claimed.	H. P. by formula, Av. stated speed.	R. P. M. in public test	Brake H. P. in public test.	H. P. by formula at speed in public test.
1	4.75	5	4	12	1000 to 1500	36	36.5	865	17.9	25.7
2	7.0	7	2	12	700 800	30	34.	...	....	....
3	6.25	7	4	30	650	45	45.	520	29.7	37.4
4	6.0	8	4	25	500 to 800	35	49.4	...	...	....
5	7.0	7	4	25	700 to 800	60	68.	730	58.5	66.0
6	7.5	8	4	40	500	60	59.2	468	45.6	55.4
7	8.0	10	3	20	350	44	44.3	311	26.2	39.3

The current practise, with horizontal gasoline engines is to make the stroke longer in proportion to the bore than in vertical engines. As the longer stroke gives a higher efficiency, we must increase the constant in the formula in order that the results obtained may be sufficiently accurate. Taking the constant, then, as 75 instead of 66 our formula becomes (for one cylinder)

$$BHP = \frac{75 L D^2 N}{1{,}000{,}000} \qquad (C)$$

in which the characters represent the same thing as before and as before the result must be multiplied by the number of cylinders in case there is more than one. Table IV shows the way this formula applies to engines built by different manufacturers of this type of engine.

TABLE IV.—HORSEPOWER OF HORIZONTAL GASOLINE ENGINES; SEVEN EXAMPLES COMPUTED BY FORMULA COMPARED WITH HORSEPOWER BY OTHER METHODS.

Eng.	Cyl. bore (ins.).	Stroke (ins.).	No. of cylinders.	Rated horsepower.	R. P. M. rated.	Brake H. P. claimed.	H. P. by formula, Av. stated speed	R. P. M. in public test	Brake H. P. in public test.	H. P. by formula at speed in public test.
1	8	14	1	15	250	19.5	16.75	249	19.7	16.7
2	8.75	15	1	20	240 to 290	28	22.8	254	22.0	21.85
3	8.75	15	1	20	240 to 290	28	22.8	235	24.2	20.3
4	8.75	14	2	35	320 to 325	45	50.0	292	46.0	46.7
5	10	15	1	25	240 to 290	30	29.8	253	31.6	28.5
6	9	13	2	17	260	30	41.0	...	....	.....
7	10	15	2	22	260	40	51.6	...	....	.....

Formulas A, B and C are proposed as being simple ones that may be readily applied by the average operator. It would perhaps be better to use a formula common to all types of gasoline engines in place of changing the constant, if one sufficiently simple and accurate can be found. However, it is not these particular formulas that the writer wishes to urge and they are simply suggested as something that might do. The writer does, however, wish to suggest that something be done towards the adoption of some kind of a uniform system of rating traction engines.

Lectures at the Chicago Cement Show.—Mr. Percy H. Wilson, Secretary of the Association of American Portland Cement Manufacturers, has announced an elaborate series of lectures to be given at the Chicago Cement Show, which will be held at the Coliseum, Feb. 18-26. The lectures deal with the diversified uses of concrete, and are divided into twenty-two subjects as follows: Mixing & Placing, Silos, Floors, Tanks, Stucco, Surface Finish, Sidewalks, Fire Places, Concrete Piles, Small Farm Uses, Concrete Poles, Concrete Bridges & Culverts, Jamestown Sea Wall, Concrete Steps, Determination of Voids, Selection of Aggregates, Manufacture of Cement, House Building, Odd Uses, Factories, Artistic Uses, Decoration with Colored Tile. These lectures promise to be among the most instructive of all the displays at the Coliseum, and will be interesting to every one, on account of the variety of subjects. Three lectures will be given each day, at 4:30 p. m., 8 p. m. and 9 p. m., in the west end of the balcony annex. Each lecture will be accompanied by a continuous lantern slide exhibition, which will add materially to its attractiveness.

Transvaal Gold Mine Statistics.—Consul Edwin N. Gunsaulus, of Johannesburg, furnishes the following figures showing gold-mining operations in the Transvaal: The total profits of 65 gold-mining companies in the Transvaal for the month of October were $4,665,647, of which the mines of the Witwatersrand produced $4,638,758. Working costs on the Rand were $4.09 per ton, and the rate of profit $2.68 per ton. The total gold yield of the Transvaal for the same month was 602,416 fine ounces, valued at $12,436,263. For the 10 months of the present year the Transvaal gold mines have yielded 6,077,790 fine ounces, valued at $125,469,745, an increase of $5,958,016 over the corresponding period of last year. On October 31 there were employed on the producing gold mines of the Rand 19,458 whites, 145,104 colored persons, and 3,204 Chinese. On developing mines, of which there were 44 employing labor, 2,109 whites were employed and 9,644 colored.

New Loan for Russian Public Works.—Consul John H. Grout, of Odessa, advises that the prefect of Nicolaieff, southern Russia, has favorably passed upon a new project recently voted for by the municipal council, which will involve the raising of a $4,892,500 loan for carrying out public improvements, among which are the following: An electric tramway system and the purchase of the existing line of horse cars, $1,030,000; drainage, $51,500; dredging the port of Nicolaieff, $566,500; new abattoirs, $180,250; new markets, $154,500; schools, $103,000; improving the city electric lighting plant, $103,000; for the municipal pawn shop, $103,000; construction of court buildings, $77,250. In accordance with the law, the matter has now been referred to the authorities at St. Petersburg for approval, which, it is expected, will be gained.

Plans were approved on Jan. 6 by the New York State Canal Board for four additional barge canal contracts, involving work that it is estimated will cost more than $3,000,000. They include contract No. 21, for excavating from Genesee River west to contract No. 6, in Monroe county, at an estimated cost of $1,475,900; contract No. 39, dredging the Oswego River between Fulton and Three River Point, at a cost of about $972,900; contract No. 73, dredging the Hudson River between Stillwater and Northumberland, at a cost of about $648,300, and contract No. 78, building a dyke in the Oswego River south of Fulton, at a cost of about $55,154.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Economics of Street Pavements.*

When a street roadway is to be paved the first question that arises and must be decided is, what kind of pavement shall be used? To correctly answer this question involves the consideration of the relative value in use of the different kinds of pavement available and their adaptability to the varying conditions to which city streets are subjected. This may be called the economics of street pavements.

The economic questions involved in street paving are, to the public mind, the more immediately important ones and more appropriate for discussion in this report. Some of them only can be considered:

If we regard a pavement merely as a business enterprise the question becomes what kind of pavement, if laid on a given street, subject to known conditions, will yield the best return upon the money invested in it? Like other industrial questions this must be considered on business principles and in the light of the facts so far as these are known. It cannot be intelligently decided offhand or by mere casual opinion.

It is hardly necessary to say that there is a wide range of opinion in the public mind as to the comparative value and economy of the several pavements, and even among municipal engineers opinion is more or less divided. It is therefore proper to say that what follows represents my own personal judgment and conclusions, but it may not be out of place to add that these conclusions are the result of special studies and observations in many American cities, extending over more than a score of years, and of a large experience in the actual construction and maintenance of pavements. It is also proper to say that the opinions herein expressed generally agree closely with those of other engineers and specialists who have made street paving a subject of careful study.

The cost of a street pavement should be treated as an investment to accomplish a certain purpose with the smallest expenditure of money. The purpose is to keep a street properly paved, and considered from the business standpoint the question may be stated thus: How may a suitable pavement be maintained upon the street at the lowest cost per square yard per year?

It is quite common to base opinions of the economy of a pavement upon its cost price and its durability. These two elements are important only as they may affect the general account. Considered independently they may not only be of little real value but may lead to erroneous conclusions. The first cost of one pavement may be double that of another, but if it gives three times as much return in service it is obviously the cheaper of the two.

Durability as applied to a pavement is only a comparative term. The relative durability of pavements has been a subject of wide discussion, often based on wrong assumptions, misinformation, or erroneous standards of comparisons. The life of a pavement is determined by two wholly different factors or by their combined effect—the natural durability of the materials of which it is constructed and the wear and tear of travel.

All pavements are subject to more or less deterioration by age and the action of the elements, even if subjected to no travel. But some are thus more affected than others. Thus a well constructed granite block pavement on a concrete foundation should last, if undisturbed, for a long period, while an untreated wood block pavement on a gravel foundation will be destroyed by natural decay in a few years. So far as destruction by natural decay is concerned, the life of a pavement is independent of the quantity of travel over it.

On the other hand, it is now well recognized that, disregarding the element of natural decay, the life of a pavement is measured by the quantity of travel to which it is subjected. In other words, if of two pavements, equal in other respects, one is subjected to double as much travel as the other its life in years will be but one-half that of the other. Consequently in pavements that are worn out before they are affected by natural decay the only true measure of their life is not the number of years they will last but the total quantity of travel they will carry before they are worn out. The statement that a certain pavement on a certain street has lasted a dozen or any number of years gives no idea of its durability unless the quantity of travel, say in tons per square yard per year, is also given. In other words, the endurance of a pavement is not measured by years but by the total service it is capable of giving.

To the neglect of this principle is largely due the very conflicting statements that are common about the relative durability of the several kinds of pavement. Until cities shall appreciate the importance of keeping a record, as by censuses of travel at regular intervals, of the quantity of travel carried by at least a few representative streets we shall have no exact knowledge of the relative durability of the several kinds of pavement, and in the meantime we must rely on such results of general observations as may be available.

The factors that must be taken into account in determining the comparative economy of the different pavements are the following:

1. The original cost of the pavement.
2. Interest on the original cost.
3. Payments to a sinking fund to redeem at some future time the debt incurred for construction.
4. Cost of maintenance, including cleaning and watering.
5. The useful life of the pavement, usually called its durability.
6. Value of the worn-out pavement for purposes of renewal.

Unfortunately the data for determining the value of some of these factors is far from complete or satisfactory. The first cost can usually be determined, and the prevailing rate of interest on money is known. For some kinds of pavements we have fairly satisfactory data as to cost of maintenance, for others we have not. The relative but not the actual durability or life of most of the pavements in common use is fairly well known to engineers, though the public generally has a wrong conception of it.

We shall be compelled therefore to make use of the best information available in the discussion that follows, and it is obvious that the conclusions arrived at may be only approximately correct, but the errors due to lack of complete data are likely to be so small and unimportant that they will hardly change the general conclusions.

Using the best information available we may compute the cost per square yard per year of keeping a street properly paved with a given kind of pavement for any period of years.

Take, for example, a first class granite block pavement on the heaviest traveled business streets of the city of Boston. The original first cost, including the necessary excavation, should be about $3.86 per square yard. If the pavement be paid for by an issue of bonds, the interest paid on the bonds is justly chargeable to the pavement. Assume that the pavement will last, with ordinary repairs, 13 years before it needs to be reconstructed. During this period the pavement will require more or less ordinary repairs, which we will not be very wrong in estimating will cost an average of 1½ cts. per square yard per year, which obviously is also a legitimate charge against it that must be taken into consideration.

The reconstruction will not cost as much as the original construction, because the excavation will have been done, and the concrete foundation should be still good and available for the reconstructed pavement. The old blocks taken up should still have a value equal to the cost of taking them up and of making such incidental repairs to the concrete as may be found necessary.

The cost of reconstruction with new blocks would be about $3 per square yard, and when completed the pavement should be practically as good as the original pavement when new.

The cost of reconstruction should be met without increasing the original debt, since it is really a part of the permanent maintenance of the pavement, and to do this we may provide a sinking fund by setting aside each year during the life of the original pavement a sum which, at the time the reconstruction must be undertaken, will amount to its estimated cost.

The operation of renewing the pavement may be repeated any number of times in this way, without increasing the debt incurred for the original construction. But this debt will remain and if the bonds were issued for a period of thirty years a sinking fund must be established to take them up when they fall due.

We have now provided for the structural expenses of the pavement, but other expenses must be incurred to care for it properly. It must be kept clean, and inasmuch as the cost of cleaning the different kinds of pavement varies, we must, if we wish to compare the cost one with another, take this expense into consideration. The same is true of watering, but if a granite pavement be kept properly cleaned watering will not be necessary and we may disregard its cost.

Considering all these items we may make up the cost of maintaining 1 sq. yd. of the pavement per year as follows:

Interest on first cost ($3.86 at 4 per cent)	$0.154
Annual payment to fund to redeem bonds in thirty years, interest 3½ per cent.	.075
Annual payment to sinking fund to provide sum necessary for reconstruction at end of thirteen years	.152
Cost of ordinary repairs during the life of the pavement per square yard per year.	.015
Cost of cleaning per square yard per year, say	.190
Total cost per square yard per year	$0.586

We thus find that the actual cost of this pavement to the city is about 59 cts. per square yard per year.

Every item here entered is a legitimate charge against the pavement, though it is not asserted that the amount charged is strictly accurate. The method followed is in principle the same as any careful business man would apply in getting at the true cost of the products of his factory. Assuming the same general conditions, we may make similar computations to determine the annual cost of other kinds of pavement.

It is only by the application of such methods that the annual cost, and therefore the comparative value, of the different kinds of pavement can be intelligently ascertained.

Applying this method to the three kinds of roadway pavement most largely in use in Boston—granite block, sheet asphalt, and macadam—we may compute the annual cost of each under average conditions. These conditions obviously vary with the character of the streets, which for our present purpose may be divided into four general classes:

A. Streets with a very large volume of travel of the heaviest character, as central business of streets.

B. Secondary business streets with travel of moderate volume and weight.

C. Main city or suburban thoroughfares having a large volume of comparatively light travel.

D. Suburban or residence streets where travel is mainly of a local character and light.

*From a report by Samuel Whinery, Consulting Engineer, New York City, to the Finance Commission of the City of Boston, Mass.

A different character of construction for the same kind of pavement is appropriate for these different classes of streets, and its first cost will therefore vary with the class. For instance, granite block pavements for Class A and Class B streets should be laid upon a concrete foundation, while for classes C and D a broken stone foundation may be sufficient, and where a concrete foundation is used its thickness may vary with the different classes of streets.

Considering first granite block pavement we may figure its annual cost per square yard for the four classes of streets as shown in Table I.

renewal represent what, in my opinion, should be the maximum costs in Boston at this time. The actual cost is and has been for many years much higher.

The assumed life of the pavements in years represents what should be their useful life. There comes a time in the life of every pavement when it will be cheaper to renew it than to continue repairing the old. Pavements are often continued in use long after it would be more economical to renew than to continue to repair them. The above computations assume that the useful life ends when they should be renewed rather than further repaired. The

TABLE I.—COST OF GRANITE BLOCK PAVEMENTS.

Specifications:	Classes of Streets. A.	B.	C.	D.
Foundation	6-in. con.	5-in. con.	6-in. [illegible]	6-in. br. st.

Payment into sinking fund to meet cost of renewal, at 3½ per cent	.149	.100	.076	.064
Average cost of ordinary repairs	.100	.040	.030	.016
Cost of cleaning	.150	.084	.084	.056
Total annual cost per square yard of maintaning the pavements	$0.576	$0.381	$0.328	[illegible]

The annual cost of macadam pavement may be arrived at as shown in Table III.

necessary and that they are kept in a good state of repair.

TABLE III.—COST OF MACADAM PAVEMENT.

Specifications:	Classes of Streets. A.	B.	C.	D.
Thickness of metal	9-in.	8-in.	7-in.	6-in.
Estimated life in years	5	6	[illegible]	10
First cost per square yard	$1.26	$1.16	$1.05	$0.94
Cost of renewal	64	60	51	51
Annual cost of pavement per square yard:				
Interest on original cost at 4 per cent	$0.050	$0.046	$0.042	[illegible]
Payment into sinking fund to meet renewal, 3½ per cent	.119	.092	.066	.043
Payment into sinking fund to redeem bonds, 30 years at 3½ per cent	.024	.022	.020	.018
Average cost of ordinary repairs	.400	.250	.150	.040
Cost of cleaning	.150	.080	.070	.030
Cost of watering	.045	.035	.030	.025
Total annual cost per square yard of maintaining the pavement	$0.788	$0.525	[illegible]	[illegible]

For a ready general comparison of results Table IV may be constructed.

Referring to Table IV it appears that for Class A streets macadam is the most expensive

TABLE IV.—COMPARISON OF COST OF VARIOUS PAVEMENTS.

	Classes of Streets. A.	B.	C.	D.
Granite block	$0.586	$0.439	$0.429	$0.358
Sheet asphalt	.576	.381	.328	.264
Macadam	.788	.525	.378	.194

These results are not presented as strictly accurate or conclusive. In the present state of our information they must be regarded as approximate only. All the conditions assumed and used may differ in any one city, and are likely to differ in different cities. Emphasis is laid upon the method of estimating the economic value of pavements rather than upon the correctness of the data here used. It may, I think, be claimed that the data and results are approximately correct for Boston and that they represent the best general information available at this time.

The figures given for first cost and cost of

pavement to use, and that there is a slight difference in favor of sheet asphalt over granite. But other considerations, the principal one being the difficulty and inconvenience of making the frequent and quite expensive repairs that would be necessary to an asphalt pavement on a crowded street, clearly indicate that the granite pavement is preferable.

For Class B streets macadam is also decidedly the most expensive, while sheet asphalt is decidedly the most economical.

On Class C streets granite is the most expensive, and there is a material difference in favor of sheet asphalt over macadam, but the relative cost of the two does not differ very widely.

For Class D streets granite is comparatively very expensive, and macadam is so decidedly the cheapest that if economy alone is considered it merits almost exclusive use.

Evaporation from Water Surfaces.

Mr. Sidney R. Lowcock in a paper read before the Association of Water Engineers, London, gives the following formula for evaporation from water surfaces,

$$E = 0.0001254\ md$$

in which

E=evaporation in inches

m=mean maximum sun temperature (Fahr.)

d=duration of sunshine in hours.

This formula may be true only for England where his experiments were made and gives results for the whole year. It gives a result rather too high for the winter months and low for the summer months. The author believes that radiant heat has a far greater effect upon evaporation than heat transmitted by contact; therefore evaporation records from tanks will apply to reservoirs.

In the borough of Blackpool, England, for the year ending March 31st, 1909, there were 17,969 tons of house and trades refuse disposed of at the corporation refuse destructor (incinerator). The net cost was 33 cts. per ton, for actual operating costs, not including interest and sinking fund repayments on capital.

The returns from sale of products were as follows:

Clinkers and screened ashes at from 12 cts. to 36 cts. per ton	$945.60
Mortar and ground oyster shells at from 96 cts. per ton	1,800.00
Scrap iron and old tins in compressed toles at $3.60 per ton	192.00
Fish manure at $23.40 per ton	1,387.20
Electric current	350.40
Sundries	28.80
Total	$4,704.00

Equal to a credit of 26 cts. per ton on the refuse burnt.

Your attention is called to the saving made by metering the system throughout. At the rate our pumpage has increased each year, we would have pumped 411 million gallons, or 101 million gallons more than durinig the year 1906, which would have necessitated an additional engine man and fireman. Although we have been but a few months 100% metered (270 meters having been set since January 1, 1907), and the minimum rates made $1.00 less than the correspondinig flat rates, we are able to give the following results:

Consumption decreased 38,897,373 gallons.

Water rents increased	$ 168.97
Coal saved	308.85
Packing saved	27.01
Oil and waste saved	48.39
Night attendance saved	1,200.00
Total saved not including additional deterioration	$1,753.22

—Extract from Superintendent's Report, Canandaigua Water Dept., Canandaigua, N. Y. Mr. G. R. Ellis, Supt.

Records for placing concrete in the Gatun Locks of the Panama Canal were broken on Dec. 10, 1909, when 1,866 cu. yds. were placed in 8 hours. The record for six days, Dec. 6 to 11 inclusive, was as follows:

Date.	Cu. yds.
Dec. 6	[illegible]
Dec. 7	1,706
Dec. 8	[illegible]
Dec. 9	[illegible]
Dec. 10	[illegible]
Dec. 11	[illegible]
Total	[illegible]

The total amount of excavation on the Panama Canal done by the French has been carefully estimated by a committee appointed by Chief Engineer Goethals. This committee reports the total excavation to have been 78,146,960 cu. yds., of which 29,908,000 cu. yds. is the amount useful in the present canal work.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Formulas for the Capacity of Tile Drains.

At the annual meeting of the American Society of Agricultural Engineers, held at Ames, Ia., on Dec. 27-28, 1909 Professor E. A. Hamilton of the Iowa State College, Ames, Ia., read a paper in favor of the adoption of the Chezy and Kutter formulas by drainage engineers instead of the older formula of Hawksley, now used.

The Hawksley formula has persisted for many years because of its convenience. It is, however, among the long list of formulas declared to be obsolete by hydraulic engineers because of the fixed coefficient which does not take into consideration the condition of the pipe or the relation the area bears to wetted surface. This formula is as follows:

$$Q = 1.148 \sqrt{\frac{df}{l + 54d}}$$

in which

Q = cubic feet of water per second
A = area of pipe in sq. ft.
d = diameter of pipe in feet.
f = fall in feet for the distance l.

The formula was simply a modification by Hawksley for clean cast iron pipes, of the Eytelwein formula, and was the result of experiments upon certain size pipes in a smooth condition. For some years last century it was in common use and the survival of this formula in land drainage is a result of the lack of precision heretofore deemed necessary by many engineers in drainage calculations.

Professor Hamilton, using a value of 48 for the coefficient in the Hawksley formula, intended only for clean cast iron pipes, calculated the capacity of tile drains of diameters from 4 ins. to 36 ins. Assuming a 36-in. tile as capable of removing ¼ acre inch of water and using the Hawksley formula the results were as follows:

A 36-inch tile will remove 0.25 acre inch
A 24-inch tile will remove 0.23 acre inch
A 18-inch tile will remove 0.21 acre inch.
A 12-inch tile will remove 0.19 acre inch.
A 8-inch tile will remove 0.17 acre inch
A 6-inch tile will remove 0.16 acre inch.
A 4-inch tile will remove 0.14 acre inch.

The grade assumed was 0.1 per cent and on a percentage basis the pipe capacities are:

36-inch . . . . . 100 per cent
24-inch . . . . . 92 per cent
18-inch . . . . . 84 per cent
12-inch . . . . . 76 per cent
8-inch . . . . . 68 per cent
6-inch . . . . . 64 per cent
4-inch . . . . . 56 per cent

In Kutter's formula for the evaluation of the factor, C, in the Chezy formula a coefficient of roughness is assumed for the many kinds of surfaces found in pipes and for the many materials of which conduits are made. For well planed timber in perfect order and alinement the coefficient, $n = 0.009$, and for cement and terra cotta pipes with imperfect joints and in bad order (a condition closely approximating that of even the best laid tile drains), the coefficient, $n = 0.015$. Taking the above results given by the Hawksley formula and working back to obtain a value for the coefficient, n, the result was a number of coefficients, ranging from 0.015 for the 36 in. pipe, to a coefficient of 0.0095 in a 4 in. tile. The following table gives the results:

For a 4-in. tile, n = 0.0095
For a 6-in. tile, n = 0.0115
For a 8-in. tile, n = 0.0125
For a 12-in. tile, n = 0.012
For a 18-in. tile, n = 0.011
For a 24-in. tile, n = 0.0105
For a 36-in. tile, n = 0.0095

This shows conclusively that the Hawksley formula with its constant of 48 is not exact enough for use in any hydraulic calculations. Professor Hamilton has calculated values of C for a grade of 0.1 per cent which he believes engineers can use with the Chezy formula and avoid the laborious work heretofore connected with the use of the Kutter formula in evaluating C. He uses a coefficient, $n = 0.014$ but says that for tile carelessly or unevenly laid the coefficient might better be $n = 0.015$. If it is thought best to use a coefficient of 0.015 deduct 6 per cent from the values in this table. When the grade is near 0.05 per cent, deduct 1; when the grade is at or above 0.5 per cent add 1. The values in the table are true only for a grade of 0.1 per cent.

Table of values of C, in formula:

$$Q = AC\sqrt{rs}$$

in which
Q = cubic feet per second.
A = area of pipe in square feet.
r = hydraulic mean radius = 0.25 for pipes.
s = sine of slope = fall divided by length, or grade per cent divided by 100.
C = a factor in the table.

Size of tile.	Value of C.	Size of tile.	Value of C.
4 in.	54	15 in.	82
5	59	16	84
6	63	18	86
7	66	20	88
8	69	22	90
9	72	24	92
10	74	28	94
12	77	30	95
14	80	36	96

Note—To convert above discharge to acres drained by ¼ in. standard, divide by 0.105.

Refuse Disposal, and the New Refuse Incineration Plant for Milwaukee.*

In December, 1907, Mr. Rudolph Hering, consulting engineer, presented a report to the mayor and common council of the city of Milwaukee dealing with the problem of the disposal of the refuse of the city. This report presented data relative to the quantity and character of the refuse and fully discussed the various methods of refuse disposal. Based on the investigations described in the report, Mr. Hering recommended "as a first installment a plant capable of incinerating 300 tons daily, costing $200,000."

This report was accepted by the city council and Mr. Hering was engaged to prepare plans and specifications for the work. Bids were called for in accordance with these plans and specifications and on April 3, 1909, the contract for a 300-ton refuse incineration plant was awarded to the Power Specialty Company of New York. Their contract with the city includes the excavation, piling, concrete, furnaces, boilers, flues, cranes, and machinery for the plant. It does not include the chimney or the superstructure for the plant, these parts of the work having been let under separate contracts. The total amount of all the contracts foots up to slightly less than $200,000. The actual work of construction is now under way. Hering & Fuller, consulting engineers, 170 Broadway, New York city, have been engaged by the city to supervise the construction of the plant. It is expected that the plant will be in operation early in the spring of 1910.

The purpose of the plant is to burn refuse completely, without nuisance and at an average temperature of 1,500° Fahr. The design and development of such a plant fundamentally involve some knowledge of the character of the material to be burned.

According to the specifications, refuse is defined as being a mixture of garbage, ashes, rubbish, manure and small dead animals. These are the chief constituents of city refuse. The composition and character of such refuse vary from season to season and even from day to day. Nevertheless, limiting conditions may be determined which control the design. Thus in winter, when the percentage of ashes in the refuse is high, the clinker produced in burning the refuse will be the greatest, and its handling will be most difficult. In the summer, on the other hand, the clinkering will be easier work, but the maintenance of a high temperature will be difficult on account of the high proportion of wet garbage in the refuse. The rate of combustion will be low, and the capacity of the plant will be based on summer conditions. Following are the compositions of ashes, manure, garbage and rubbish as they were used in working out the plans for this work. They are briefly compared with analyses determined elsewhere.

Ashes.—Ashes are either steam ashes, such as come from large boiler plants, or are household ashes. They contain about 15 per cent of water, 10 per cent of volatile matter, 50 per cent of true ash and 25 per cent of carbon. Ashes analyzed in Pittsburg for a report by Mr. Hering contained on the average 7 per cent of water, 10 per cent of volatile matter, 58 per cent of true ash and 25 per cent of carbon. The average chemical analysis of ashes given in the "Report of Commission on Street Cleaning and Waste Disposal, the City of New York, 1907," is 27 per cent of water, 8 per cent of volatile matter, 53 per cent of true ash and 18 per cent of carbon. This ash contains a rather high percentage of water. The calorific value of ashes is about 3,700 B. t. u. per pound.

Manure.—Manure is the cleanings from stables. I know of no chemical analysis of manure. In El Paso, Tex., it has been used as a fuel under boilers. It has been assumed that it contains 40 per cent of water, 25 per cent of volatile matter, 15 per cent of true ash and 20 per cent of carbon. One of the bidders for the work here based his guarantee for temperature and evaporation on a composition of 70 per cent water, 13 per cent of volatile matter, 4 per cent of true ash and 13 per cent carbon. The calorific value of manure is therefore about 2,700 B. t. u. per pound.

Garbage.—Garbage is the waste from kitchens, restaurants, butcher shops, hotels, etc. It has been chemically analyzed in Milwaukee and in several other places. The results of the analyses in Milwaukee were 78 per cent of water, 14 per cent of ash and 8 per cent of combustible. Analyses made in New York by the Commission on Street Cleaning gave an average chemical content of 69 per cent water, 22 per cent volatile matter, 5 per cent ash and 4 per cent carbon. The tests made by Mr. J. T. Fetherstone at West New Brighton, N. Y., showed an average composition of 73 per cent water, 17 per cent volatile matter, 5 per cent ash and 5 per cent carbon. The calorific value is not far from 2,000 B. t. u. per pound.

Rubbish.—Rubbish contains papers, wood, rags, bedding, leather, glass, metals, sweepings from stores and offices, and litter of a similar nature. The composition taken for Milwaukee is 15 per cent of water, 45 per cent volatile matter, 15 per cent ash and 25 per cent carbon. One of the bidders for the work at Milwaukee assumed a composition of 8 per cent water, 38 per cent volatile matter, 14 per cent ash and 40 per cent carbon. Tests by Mr. Fetherstone at West New Brighton gave an average composition of 6 per cent water, 65 per cent volatile matter, 14 per cent ash and 15 per cent carbon. Analyses made by the Commission on Street Cleaning of New York gave 12 per cent water, 40 per cent volatile matter, 8 per cent ash and 40 per cent carbon. The calorific value of rubbish may vary from 5,000 B. t. u. to 7,500 B. t. u. per pound.

(Average coal has a calorific value of 14,000 B.t.u. per lb.—Ed.)

Refuse—The mixture of these component

*Read before the Engineers' Society of Milwaukee, May 12, 1909, by Samuel A. Greeley, Resident Engineer, and printed in the Journal of the Association of Engineering Societies for November, 1909.

parts and of small dead animals is defined as refuse. The proportions in which these components enter into the mass of refuse have been carefully measured and are given for the various seasons in the following table:

TABLE I.

	Summer, Per cent.	Winter, Per cent.	Average for year, Per cent.
Garbage	57	31	41
Ashes	30	60	41
Rubbish	5	6	5
Manure	8	3	13
	100	100	100

The proportions are all given by weight. If we combine these percentage proportions with the chemical composition of each component already given, we get the following composition of refuse for summer, winter and for the average throughout the year:

TABLE II.

	Summer, Per cent.	Winter, Per cent.	Average for year, Per cent.
Water	55	35	45
Volatile matter	13	11	11
Ash	20	35	30
Carbon	14	19	16
Total	100	100	100
B.t.u. per pound	2 850	3 350	3 120

If we reduce Table II to pounds per ton we get the following values:

garbage, can be burned, the proportion of garbage will be lowered and the calorific value of the refuse will be correspondingly increased.

Methods of Disposal.—There are several methods of refuse disposal, such as by dumping on the land or at sea, by burial in suitable soil, by feeding to swine, by reduction or by incineration.

Ashes and rubbish are very often dumped on waste land within convenient hauling distance, as is done in your own city and in Chicago. This is dangerous to health, because germs of disease from sick rooms and hospitals may be lodged in the cast-off clothing and bedding, in the rubbish, and may be spread by the wind, by flies, or otherwise. Such rubbish should be burned.

Dumping at sea or in the lake has been practiced in Milwaukee, but has never been favored as a permanent method of disposal. In New York City a portion of the garbage is dumped at sea.

Burial in the soil may satisfactorily dispose of garbage. Too often, however, the garbage is not buried, but is only spread out upon the ground surface to rot and create obnoxious odors. In York, Pa., such odors were objectionable at a distance of one mile.

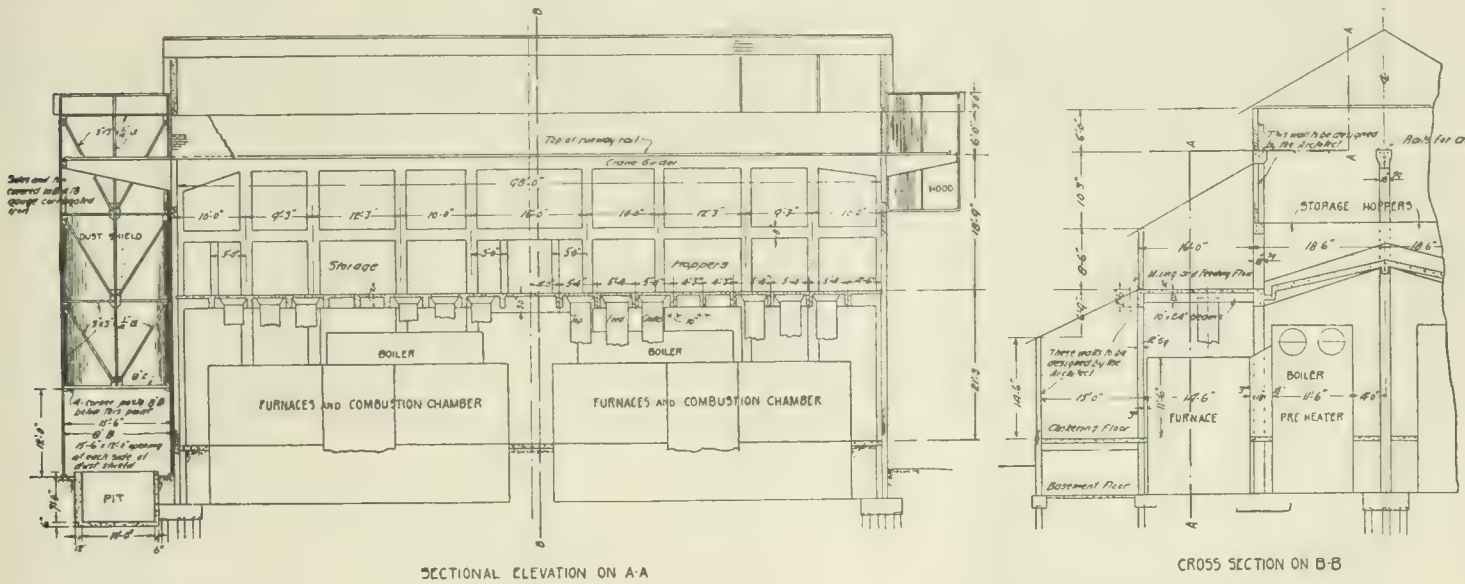
1,500 degrees Fahr. and generate useful steam.

These high temperature refuse incinerators can be classified according to the method of charging. There are the bottom charged incinerators, which are always charged by hand, and the top charged incinerators, which may be charged by hand or mechanically. The bottom charged incinerator is a front fed or a back fed incinerator, depending upon whether the refuse is shoveled in through openings in the front wall or back wall of the furnace.

The Milwaukee refuse incineration plant is a top charged plant. It is also a mechanically charged plant, because the refuse will be charged on to the grate through a mechanically operated device.

The Milwaukee Incinerator.—Figures 1, 2 and 3 show, in plan and sections, the plant designed for Milwaukee to burn the grades of refuse which have been described.

The building is about 100 ft. square and 45 ft. high to the eaves at the highest point, and the chimney is located west of the building, about 20 ft. from the wall. The plant comprises (1) the two cranes and crane runways; (2) the storage hoppers; (3) the mixing and feeding floors with the mechanically controlled tubes for charging; (4) the floor for fans and fan engines; (5) the two clinkering floors on



SECTIONAL ELEVATION ON A-A

CROSS SECTION ON B-B

Fig. 1—Sections Showing Arrangement of Refuse Incinerator Building, Milwaukee, Wis.

TABLE III.

	Summer, Pounds.	Winter, Pounds.	Average for year, Pounds.
Water	1 060	700	880
Volatile matter	260	220	220
Ash	400	700	600
Carbon	280	380	320
	2 000	2 000	2 000

The successful bidder for the Milwaukee work based his guarantee on the chemical composition given in the following table. These percentages, as elsewhere, are given by weight of the wet material as collected:

TABLE IV.

	Summer, Per cent.	Winter, Per cent.	Average for year, Per cent.
Water	45.2	25.2	35.0
Volatile matter	18.2	12.7	18.7
Ash	26.8	41.5	30.6
Carbon	9.8	20.6	15.7
Total	100.0	100.0	100.0
B.t.u. per pound	3 134	3 900	3 475

Such, then, is the character of the refuse to be burned in the new incinerator. The quantity will be 300 tons per day. This will be made up of garbage from the whole city and of the ashes and rubbish from wards 1 to 7 inclusive, together with sufficient manure to make up the total quantity. The quantity of small dead animals will not exceed one ton per day. The proportion of garbage in the refuse is, therefore, unusually high and does not represent the true average proportion for the whole city. Eventually if other incinerators are built, so that all of the ashes and rubbish of the city, as well as all of the

Feeding to swine is a method of disposal applicable to garbage only. It is used in Worcester, Mass., where about 3,000 pigs are kept to dispose of the garbage from a population of 130,000 people. The cost of disposal is about 85 cents per ton of garbage after deducting receipts from the sale of pigs.

The reduction process of disposal is also applicable to garbage only. It consists briefly in causing the garbage to be separated into three parts—water, grease and a dry material called tankage, which is useful as a base for commercial fertilizers.

Incineration or burning of the mixed refuse of the city is the method of disposal recommended by Mr. Hering, and a refuse incineration plant is now under construction. There are two classes of plants designed to burn refuse. One of these is the natural outgrowth of the early American garbage crematory, which is designed to burn garbage only, and which requires the use of coal, oil or other auxiliary fuel. A plant of this kind is now in operation on Jones Island and burns the garbage of the city. Coal is the fuel used.

The other class of incinerator is based largely on experience abroad and is designed to burn mixed refuse. As distinguished from the refuse incinerator, the garbage crematory commonly burns garbage only, requires the use of an auxiliary fuel, operates at comparatively low temperatures and is not used to generate steam. Refuse incinerators, on the other hand, burn mixed refuse, use no additional fuel, operate at temperatures averaging

which the furnaces will front and between which will be the boilers, generators, office room and lavatory; (6) the basement, in which the clinker cars will operate and which will make the settings of the furnaces and boilers accessible; (7) the main flue running east from the center line of the building; (8) the radial brick chimney; and (9) the recording and measuring instruments.

The foundations above the piles, the columns, floors, storage hoppers and crane runways will be built of reinforced concrete. The walls of the building will be of brick, and the roof of red reinforced cement tile.

The crane runways will extend out of the building over the roadways at the north and south ends of the plant. At the north end of the plant the garbage carts with their removable boxes will arrive. Bottom dumping rubbish, ash and manure wagons will deposit their contents into boxes placed in a special dumping pit at the south end of the building. The cranes, as they travel outside of the building, will be protected by galvanized iron hoods.

Three-ton, three-motor traveling cranes will be installed. They will lift the boxes from the dumping pits and will deliver their contents into the hoppers.

The storage hoppers will be built in four sections, one for each furnace, and each section will be divided into three compartments. Each section of three compartments will be about 36 ft. long over all and 17 ft. wide, with an average height of 7 ft. The floors of all

the compartments have a slope of about 1 in 4 from a ridge along the center line of the building to the feeding and mixing floors at the foot of the slopes. At the bottom of each compartment will be a gutter covered by a perforated cast iron plate and connected to the sewer. The hoppers are designed so that the ingredients of the refuse can be separately stored. In this way the free water in the garbage can drain away to the sewer.

Extending horizontally from the two hoppers, and separated by them, are the two mixing and feeding floors. The mechanically controlled charging tubes open at the level of these floors, there being six tubes for each furnace. The various ingredients of the refuse will be pulled down out of the hoppers and mixed properly on these floors, after which the mixed refuse will be pushed into the charging tubes.

The charging tubes will connect the feeding and mixing floors with the grates of the furnaces. They will enter the furnace through the top and will discharge on to a drying hearth at the back of the grate. In each tube, just above the furnace top, will be a door actuated by a wheel within the reach of the firemen on the clinkering floor. Turning this wheel lifts the door of the charging tube out of its sand sealed seat and allows the contents of the tube to fall on to the hearth below. The tubes will be made of sheet steel and will be larger at the bottom than at the top. The doors will be made of plates and angles and will move on ratchet gears with an eccentric attachment to lift the door.

There are four furnace units, each of which consists of six grates or cells, a combustion chamber, an air heater and a water tube boiler. The six cells with the ducts at the back and with the combustion chamber will occupy a space 42 ft. long by 14 ft. 6 ins. wide and will be about 2 ft. high. The six cells are divided into two groups of three cells each by the common combustion chamber at the center. Each grate will have an area of about 20 sq. ft. At the back of each grate will be a drying hearth of brick. Back of this are two ducts—the hot gas duct above and the hot air duct below.

The hot air duct will convey air, heated to a temperature of 300 degrees Fahr., and under a pressure of about 4 ins. of water, to the ash pits below the grates. This will be the air which supplies the oxygen for combustion. Fans driven by steam engines will drive this air through an air heater placed in the second pass of each boiler below the tubes, and then through the hot air duct and ash pit to the fuel on the grate.

The hot gas duct will be directly over the hot air duct and will convey gases from the combustion chamber along the duct and through holes in the division wall between the duct and the drying hearth of each grate. These gases will be at a temperature of over 1,000 degrees Fahr. and will be driven by steam jets placed near the combustion chamber. These gases will absorb moisture from the fresh refuse standing on the drying hearth before it is raked on to the grates.

The furnaces will be built of brick masonry walls 18 ins. to 24 ins. thick, 9 ins. of which will be fire brick. Special blocks will be used for the arches over the grates. The combustion chamber will extend down to the basement floor, 8 ft. below the ash pit.

The boilers will be of the horizontal water tube type, set high, with a tubular air heater set below the tubes in the second pass of each boiler. Each of the four boilers will have a rated capacity of 200 boiler h.p. The gases of combustion will pass from each group of three cells to the central combustion chamber, thence into the boilers and air heaters and finally through the flue into the chimney.

The fans and fan engines will stand on a floor raised about 5 ft. above the clinkering floor and located at the center of the building. There will be a fan and fan engine for each unit. Forty-eight inch Sirocco fans direct connected to 5-in. A B C vertical engines will be installed.

Clinkering will be done by firemen on the clinkering floor. As they draw the clinker from the grate it will fall through a trap door directly in front of each grate and into a clinker car standing on rails below in the basement. This quickly removes the dust and heat of the clinker from the firing room. Laborers in the basement will remove the clinker cars when necessary.

The basement extends under the whole building. All the boiler settings, the combustion chambers and the flue rest on foundations at the basement level and are provided with clean-out doors. In this way dust and soot can be readily removed.

The machinery is located at the level of the clinkering floor, between the furnaces and at the south end of the building. In the machinery room will be two 50 kw., 220-volt, direct-current generating sets, two boiler feed pumps and a feed water heater. At the north end of the building will be the office room and a locker room for the workmen.

Instruments for measuring the temperatures and for analyzing the waste gases will be provided.

This design provides several special features to which I wish to call your attention as follows:

(1) The garbage, being stored by itself away from the ashes and rubbish, can be drained of its free water. According to analyses made by Prof. R. E. W. Sommer with Milwaukee garbage, this free water, which will drain away under pressure of the garbage itself, amounts to as much as 7 per cent to 9 per cent of the weight of the wet garbage. Draining this water away to the sewer reduces the amount of heat used unproductively to evaporate the moisture in the refuse, and the rate of evaporation in the boilers will be correspondingly increased.

(2) The drying hearth at the back of each grate, where the refuse is partially dried before it is raked on to the fire, increases the rate of combustion. The effectiveness of this drying hearth is increased by the hot gas duct extending along the back of the hearth, which conducts the highly heated gases to the freshly charged refuse and reduces the percentage of moisture in the refuse before it is stoked on to the grate.

The drying hearth is also a valuable factor in increasing the life of the fire grate because it receives the impact of the refuse as it falls from the charging tube. Being of substantial brick construction, it is especially designed for this work.

(3) Storing the ingredients of the refuse separately in the different compartments of the hopper and providing a mixing floor as described will insure a uniformity in the grade of refuse fed to the fires. Where steam is generated, as in this plant, the value of this feature is evident. Furthermore the grade of refuse can be somewhat adapted to the station load.

(4) The mechanical charging devices will make it unnecessary to do any hand firing

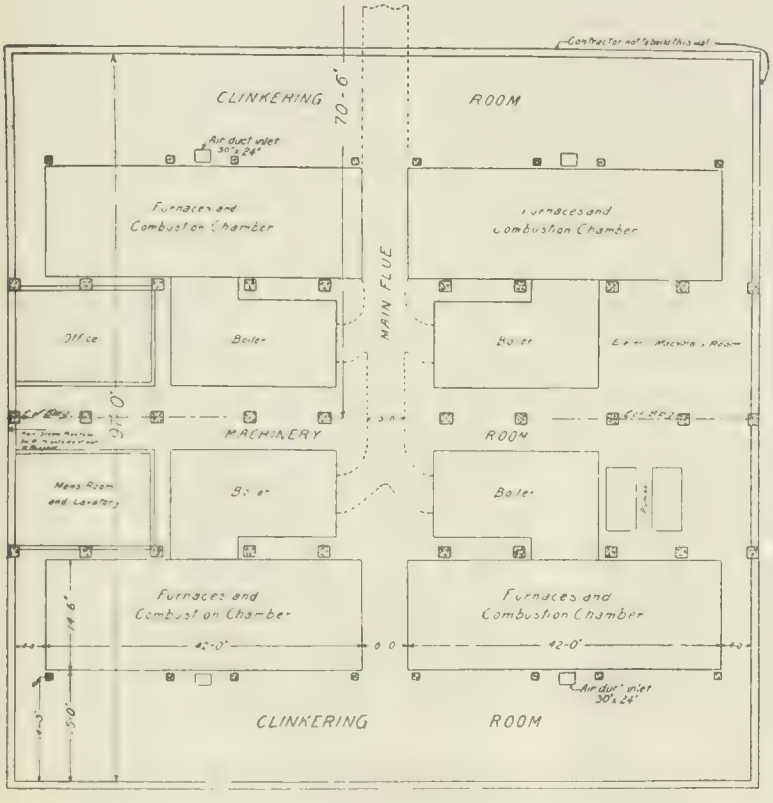


Fig. 2—Plan at Elevation of Clinkering Room, Milwaukee Refuse Incinerator.

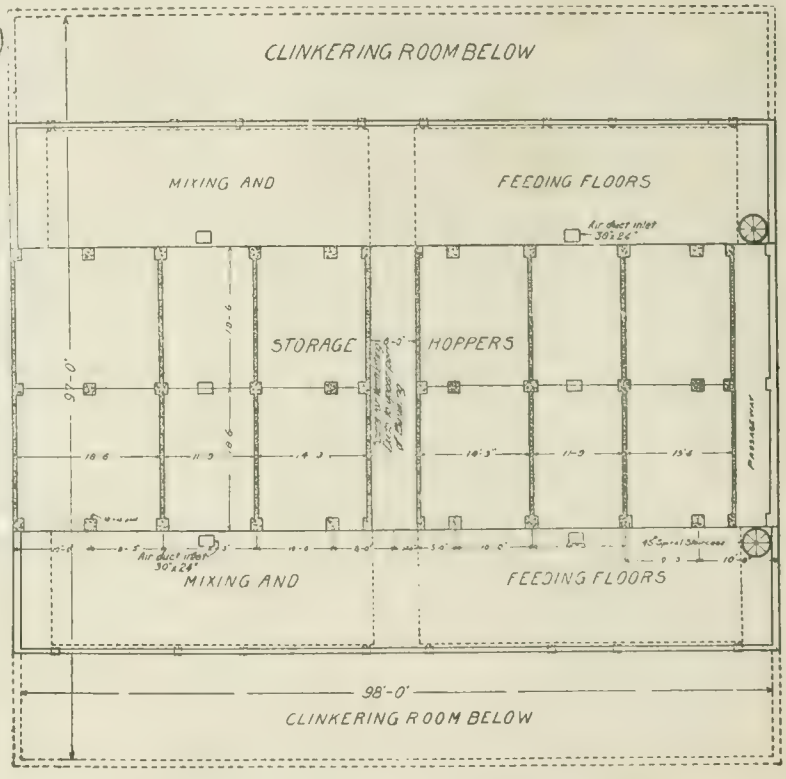

Fig. 3—Plan at Elevation of Mixing and Feeding Floors, Milwaukee Refuse Incinerator.

with wet, dirty refuse. This will reduce the manual handling of the refuse to as low a point as is possible without reducing the steaming results by removing all possibility of grading the refuse.

(5) Each operation in the conduct of the plant will be performed separately from every other. The cranesmen will work at top speed without interference from the men on the feeding and mixing floor. The men on the feeding and mixing floor will not be hindered by the men stoking the furnaces. Their whole work will be to keep the charging tubes full of refuse. Similarly the firemen will work by themselves in a room which is free from objectionable refuse and hot clinker. Their whole work will be to keep the fires as hot as possible and to thoroughly burn all the refuse. Finally the clinkermen in the basement will run the clinker cars out without interfering with the stoking above. These features should decrease the cost of operation.

(6) In burning refuse, a large amount of dust and soot is produced. If this dust settles on the boiler tubes it reduces the rate of evaporation and, if it goes up the chimney, it creates a nuisance. It is essential, therefore, to remove it. The arrangement of the grates on each side of a common combustion chamber causes the dust laden gases to enter the combustion chamber from opposite directions. This will momentarily retard the velocity of the gases and cause the dust to settle out. The combustion chamber extends 8 ft. below the ash pit and forms a pocket for the detention of this dust. It is of large cross sectional area, so that the velocity of the gases is somewhat reduced in this way. The boilers also are placed high, with their settings extending to the basement, and these settings, as well as the main flue, are all easily accessible for the removal of dust and soot and for repairs.

(7) Other features of special interest are the preheated air blast and the multicellular arrangement of the furnace grates. The air will be preheated to 300 degrees Fahr. and will increase the temperature of combustion. The multicellular arrangement of the grates will keep the temperature uniform, with no decided low points in the temperature curve during clinkering.

Results.—The contractors for the Milwaukee work have guaranteed, under bond, to maintain an average temperature in the combustion chamber of 1,500 degrees Fahr. and to evaporate 1.1 lbs. of water from and at 212 degrees Fahr. per pound of average annual refuse burned.

(Coal, depending upon boiler, will evaporate from 8 to 13 lbs. of water per lb.—Ed.)

According to the analyses and calorific values of the refuse already given, these results should be obtained. That similar results have been obtained elsewhere in practice is well known, I will briefly mention one or two such instances.

In Seattle, Wash., there is a 67-ton bottom charged refuse incinerator which has been in operation since January, 1908. Complete records of the operation of this plant have been kept and show satisfactory results. The temperature in the combustion chamber is almost always higher than 1,250 degrees Fahr., and the evaporation by actual measurement averages slightly more than 1 lb. of water per pound of refuse burned. The steam is used for the following purposes: (1) The operation of a 250 h.p. generator in parallel with the city lighting system; (2) the operation of a steam laundry; (3) the operation of a dry kiln in a kindling factory; and (4) the operation of a rock crusher with elevator and screens, which is used for the purpose of crushing and screening the clinker developed at the plant.

At Greenock, Scotland, there is a mechanically charged refuse incinerator which for the twelve months ending January 31, 1909, developed an average of 67.2 kw.-hr. per ton of refuse burned. At this plant a temperature of from 1,300 degrees to 2,160 degrees Fahr. is given as typical of a day's run. The electrical power generated netted about $8,000 for the year, and the clinker brought about $300.

Bridges, Buildings and Foundations

Note: This section is devoted to methods and costs of constructing steel and masonry bridges and buildings and of foundation work of all kinds. It will give special attention to erection plant and tools, falseworks and centers and cost data of all kinds.

A New Method of Sinking Cylinder Foundations in Underpinning the Cambridge Building, New York City.*

In July, 1907, the writer was retained by Henry G. Opdycke to report on the undermining of the Cambridge Building, on the southwest corner of Thirty-third St. and Fifth Ave., New York City, by the Pennsylvania R. R. tunnel, then under construction. Figure 1 shows the approximate cross section of the tunnel excavation at a point opposite this building, as taken by Mr. Opdycke and the writer. The space marked "To be backfilled" represents the approximate deviation from the theoretical tunnel lines, and shows that at one point an apparently misdirected blast caused a cavity extending some 3 ft. south of the building line of the Cambridge Building, or 9 ft. farther south than intended.

It also indicates roughly where Thirty-third St. caved in, on December 14, 1906, in front of the Waldorf. The cave-in had been backfilled, but the curb, the street, and the Cambridge Building had continued to settle. The tendency of the whole building was to bulge toward the north, as well as to settle vertically.

The fact that an old stream ran under the site of the Cambridge Building and the Waldorf-Astoria also aggravated matters, especialy as the break in the tunnel was at or near this old stream. The foundations of the Waldorf-Astoria had been carried down to the rock, but the east end of the Cambridge Building was founded on a spread footing of concrete and the west end on piles.

When the Cambridge Building was remodeled, in 1906, to convert it from a hotel into an office building, these piles, which were about 30 ft. long and when driven had been cut off below the water line, were found to be slightly above the water line, the latter having been lowered enough to expose their tops to the atmosphere, allowing them to rot. Therefore at that time the piles were cut off below the new water line, capped with concrete, and five heavy 20-in. I beams, about 40 ft. long, were placed on the concrete and buried in it, making a very substantial foundation for the west end of the building.

In 1907, when Mr. Opdycke and the writer examined the tunnel, they noticed that several rather large streams of water—evidently from the old stream shown on the maps—were pouring into it at this point. The examination showed that the building had settled considerably and was still settling, and the writer was requested to design a system of underpinning carried to rock. This he refused to do at that time, for fear of opening up a direct connection between the cylinders and the tunnel, thus endangering the entire building; but he recommended tying back the front wall with rods, to prevent it from falling away from the remainder of the building.

This was immediately done, as shown by Fig. 2. Two 12-in. beams, about 41 ft. long, were placed vertically just east of the main entrance on Thirty-third St., which was the point of greatest disturbance. These beams extended from the areaway floor up to and slightly above the third floor. The tops of the beams were anchored back by a 1½-in. rod, about 102 ft. long, made up of stock lengths of about 16 ft. and connected with turnbuckles.

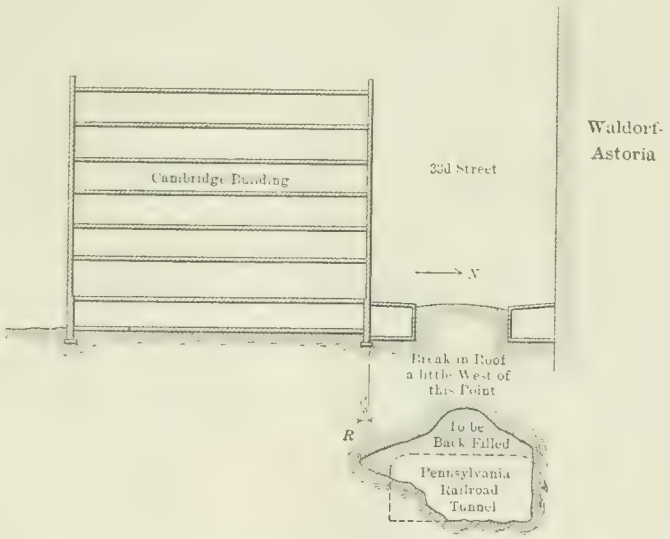

Fig. 1—Approximate Cross-Section Showing Relative Location of Pennsylvania R. R. Tunnel and the Cambridge Building.

The rear or south end of the rods ran through an open court, but close to the wall. On each side of the court 12-in. I beams, about 6 ft. long, were set vertically, and formed seats for the two 12-in. beams (18 ft. long) to which the rod was anchored. The north end of the rod was placed just under the floor in a private office and through the main hall.

The bottom ends of these long beams were anchored with two 1½-in. rods, just above the cellar floor. These rods were about 100 ft. long, and were made up of short sections, the rear or south ends being anchored to 5x9-ft. blocks of concrete, about 6 ft. deep, placed just under an old north and south partition wall, and in a position slightly inclined from the vertical. Two horizontal beams were also placed in the concrete, as shown. Near the west end of the building, another 1½-in. rod was placed, just above the cellar floor, the north end being locked over the top of the five 20-in. I beams and the south end being anchored to a similar block of concrete. Half way between this westerly rod and the first pair, a similar rod was placed and anchored in the same manner as the westerly rod. The

*Abstract of a paper by T. Kennard Thomson, Proceedings, American Society of Civil Engineers, Vol. XXXV, p. 1300.

41-ft. beams in front were then encased in sheet metal on account of their unsightly appearance.

The writer's examination was completed about July 23. A contract was at once made with Mr. Alexander Brown, Jr., to tie back the building, and the work was completed in about a week.

The rods were left in place until the permanent underpinning had been completed (during the following year), and effectually prevented the north wall from pulling away, although the entire building had apparently moved north in the interval. The anchorages in the cellar, although made very heavy, showed signs of the great strain by the cracks which opened up in the concrete floor behind them.

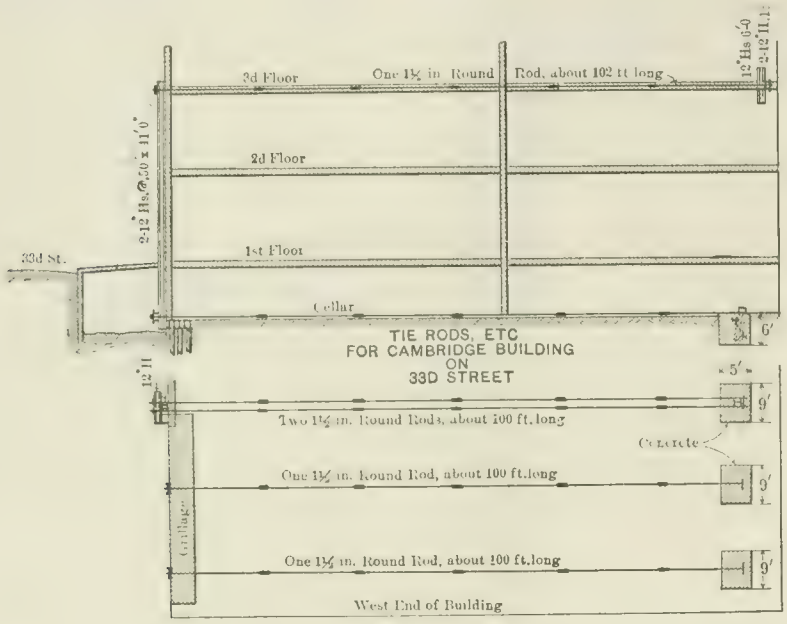

Fig. 2—Sketch Showing Method of Anchoring Cambridge Building Wall Against Bulging Outward.

When the rods were first put in, in the autumn of 1907, the writer tested them to see that they were under sufficient initial strain, and when he was called in to make another report and examination, in the following spring, a similar test indicated that they were under a considerably greater strain, showing the tendency of the building to move north. In the fall of 1908, when these rods were to be removed, the men commenced to saw through the second rod from the west on the cellar floor, quite near the end attached to the 20-in. I beams, without first slacking up the turnbuckles. When they had sawn three-quarters through the rod, it broke with a snap, and the long end sprang back about 2 ft. The men followed their instructions with the remainder of the rods, and slackened off the turnbuckles first.

The examination of the building in March, 1908, indicated that there had been considerable vertical movement or settlement since the previous fall. Borings then taken showed that the rock was about 20 ft. below the curb at the east end of the building and about 44 ft. at the west end. The substrata were found to be partly of made ground, and below that there was sand, gravel, clay, and silt or muck, such as is found in the beds of all old New York streams—a very treacherous material to have under a building.

The borings also indicated that the old stream had been entirely diverted by the tunnel, leaving the piles dry, and making their ultimate destruction by rot certain.

In the meantime the tunnel excavation had been completed, and the permanent masonry lining built in place, and it was thought that the stream which had been flowing into the tunnel the year before would back up, when it could not get into the tunnel, and again submerge the piles. The borings, however, indicated that this was not so, but that the tunnel had in some manner effectually and permanently diverted the old stream, thus lowering the ground-water level 30 ft. or more.

Reports had been obtained from H. G. Opdycke, Assoc. M. Am. Soc. C. E.; Rudolph P. Miller, M. Am. Soc. C. E.; Daniel E. Moran, M. Am. Soc. C. E., and Mr. Joseph Caccavajo, and, as these were similar in nature to that made by the writer, the Gorham Company (the lessee) decided to underpin the building to rock, and a contract for doing so was made with Mr. Alexander Brown, Jr., who retained the writer as consulting engineer to devise a plan and carry it out.

The east end of the north wall of the Cambridge Building was occupied by the show windows of the Kirkpatrick jewelry store, on the Fifth Ave. and Thirty-third St. sides of which store the old brick wall in the first story had been removed and a number of 8-in. cast-iron columns had been inserted to carry the upper brick wall and floors.

This is a kind of construction very frequently resorted to in converting old buildings into stores, etc., and answers the purpose as long as the foundations are not disturbed or the walls jacked against, as there is no transverse bracing between the columns; therefore it was decided not to use the old system, which involved jacking against the building to force cylinders or walls into the ground.

Under this end of the wall, from the curb to the cellar, there was a wall of brick and rubble masonry with some ashlar facing, which had been built, as was customary at the time and for that class of work, without any engineering supervision or advice; in other words, it was of the usual poor construction.

This foundation wall rested on a concrete footing, and on top of the wall were set the 4-in. beams, which for the length of the wall formed a base for the 8-in. cast-iron columns.

As it was not advisable to do much cutting in this wall in the condition it was then in, it was decided to reinforce it by placing a 5-ft. plate girder on each side about 1 ft. below the 4-in. beams, to bolt these two girders together with 1¼-in. bolts, and to grout the spaces between the girders and the wall. These spaces were usually 1 in. or more in width, as no attempt was made to dress down the surface of the masonry. As these girders in place were to be about 67 ft. long, they were each shipped in two sections in order that they might be put in position readily.

The west end, shown by Fig. 3, rested on the end of the old 20-in. steel beams, and the south end on a timber blocking under the sidewalk of Fifth Ave.

These girders had ½-in. web plates and one 6x6x¾ in. angle in each flange.

After the underpinning was completed, the 10 ft. under Fifth Ave. was sawn off, and a space of about 4 ft. was cut out for a door just west of the splice, the splice having been placed at that point on account of the door.

The girders were placed a little more than 2 ft. 2 ins. apart, back to back, and with the exception of the south end and the space cut out for the door were eventually bricked up on both sides, making a solid wall on top of the cylinders. As soon as the cylinders were in place and grouted, three 9-in. beams were placed under the 4-in. beams and under each column. The ends of these 9-in. beams were wedged up on top of the 5-ft. girders, thus transferring the load from the columns directly to these girders. The holes around these short beams were then filled with concrete and brickwork. There were six 8-in. cast-iron columns resting on this pair of girders, and it was now considered safe to undermine two columns at a time in order to make room for the underpinning cylinders, one of which was put directly under each of the five most easterly columns.

As the sixth column and the remainder of the wall, or the portion from the east side of the entrance to the west end of the building, was being carried on the five 20-in. grillage beams, resting on the concrete-capped piles, it was thought that it would be too expensive and dangerous to try to put the cylinders directly under the columns, especially as it would have been necessary to cut out the old piles all the way down. Therefore it was decided to sink four pairs of cylinders as close to the grillage beams as possible, and then remove enough concrete to place 20-in. I beams under the old grillage beams, the ends of these short beams to rest on the pair of cylinders, and wedges to be driven between the short beams and old long grillage beams. Three of these short beams were inserted over each pair of cylinders. At the extreme end an additional cylinder was sunk on the

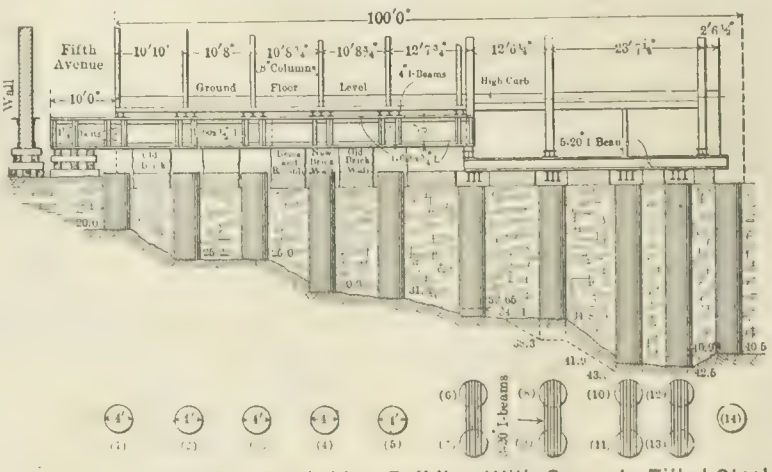

Fig. 3—Method of Underpinning Cambridge Building With Concrete Filled Steel Cylinders.

center line of the wall, making in all fourteen cylinders for the support of the building.

Two additional cylinders were sunk in the areaway, to support the north end of the boilers and the area wall.

Mr. Brown called for bids on this plan and awarded the contract to Thomas B. Bryson, as his bid was less than half as great as the other bids, and it was concluded that he could do a good job and make a fair profit, both of which he did. He also gave a bond to the owners for twice the amount of his contract. His total contract, including the extra work, was about $13,000, which included supplying and sinking the 16 cylinders, filling them with concrete, supplying and placing the girders and beams, doing the necessary wedging, etc., and back-filling with concrete where necessary.

The cylinders (Fig. 4) were 4 ft. in diameter, and had very thin shells. The method of placing them constitutes a new system of underpinning, for instead of placing the bottom section first and jacking it into the ground, and then placing another section on top and repeating the operation, a space was excavated for the top section, which was made 4 ft. deep, and the space outside of this top section

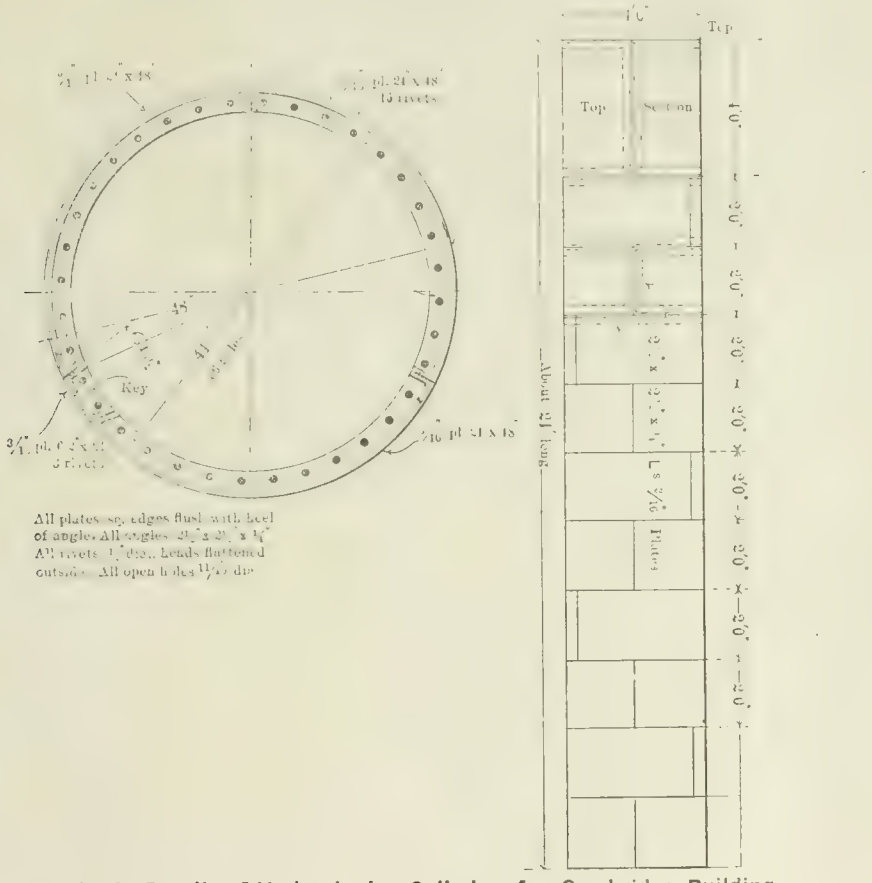

Fig. 4—Details of Underpinning Cylinders for Cambridge Building.

was back-filled, generally with concrete, and remained permanently in that position.

A laborer then entered the top section and with a short-handled shovel excavated the material under the "cutting edge" sufficiently to insert one segment of the next ring. All the rings below the top section were 2 ft. deep and in four segments, one of which was small, to act as a key, as in tunnel lining. In this key segment the connection angles were bent 13½° from the radial, to permit putting the key in place. The joints of the other segments, of course, were on the radial lines. All the plates were 3/16 in. thick and all the angles (horizontal and vertical) were 2½x2½x¼ in. When the first segment under the top section had been bolted in place, the excavation was made for the second segment, then the third, and then the fourth or key. Where the ground was good, the excavation was made for all four segments at once.

Although the borings showed that all the water had been drained off, it was considered desirable to provide in the contract for doing the work under compressed air if water should be encountered, and the first cylinder to be sunk had gaskets in the joints, but as it was found that the borings had been correct in showing the absence of water, no effort was made to obtain water-tight joints in the other 15 cylinders.

In sinking one of the cylinders the rock gave evidence of having been blasted, as it undoubtedly had been, as this cylinder was directly over the tunnel. The flushing of the street near the Waldorf allowed considerable water to percolate and get into the uncaulked joints of the cylinder, sometimes in quite a stream, but it was noted with surprise that this water disappeared as soon as it reached the bottom of the cylinder, passing into the drains or crevices alongside of the completed tunnel, although these drains were supposed to have been blocked off or choked up.

This proved the existence of the second danger feared for the Cambridge Building, resulting from the construction of the tunnel. The first was the rotting of the piles due to the removal of the ground water, and the second the removal of the subsoil, especially where it was muck or silt, as in this case, by the continual draining of the water from the streets, old streams, etc., into or alongside of the tunnels, for it is known, of course, that such continual drainage must carry a large amount of soil or muck with it, causing a gradually enlarged cavity which, sooner or later, would be filled from above, perhaps suddenly, and with disastrous results.

This action is occurring in so many places in New York City that some day we may expect to see a whole building suddenly collapse, like some of the villages in mining districts.

These plans were drawn up in July, 1908; Mr. Bryson was awarded the contract early in August, and by August 21 he had the first cylinder on rock, having spent 4 or 5 days on it, as his men were new to the work, and extra precautions were taken against water, etc. The other cylinders were put down at the rate of about 2 days each for a depth of about 30 ft. below the curb, the 16th or last cylinder being completed exactly 30 days after the first was landed. Generally an attempt was made to work on two cylinders at a time, but in such cramped spaces it was difficult and subject to delays. Mr. Bryson sublet the placing of the four 33½-ft. girders to Mr. Frank M. Tench, who handled the ticklish problem without disturbing the sidewalk in front of the jewelry store. As the cellar under this store was a salesroom for valuable goods, such as statues, paintings, etc., it was necessary to build a tight wooden partition, about 5 ft. south of the wall, which was reinforced by the girders, before work was started, and, after the girders had been bricked in, furred and plastered, the rich red burlap was replaced before the temporary partition was removed.

A Suggested Form of Building Contract Designed to Secure Justice and Equity to Both Owner and Contractor.

This paper has been limited to agreements for the construction of buildings, and no attempt has been made to cover the subject of agreements in general, because the writer has given this type special study and also feels that the principles underlying such agreements are readily adaptable to those for other construction, and that, within the limits of this paper, many of the vital questions at issue can be brought out more effectively by taking a concrete case rather than by dealing in generalities.

From the practical standpoint of the building agreement, it matters little whether the person who planned the building and will have charge of it until completion is called an Engineer or an Architect. The only practical difference would be that the word "Engineer" would be used in one case and the word "Architect" in the other, to represent such a person. Therefore, it should be understood that wherever the word "Engineer" is used throughout this paper it is intended to designate a person properly equipped by education, experience, training, or temperament, to lay out, supervise, and direct, in an executive capacity, all work, at any stage, in the erection of a building, from the time it is mentally conceived until it is finished and ready for use.

The purpose of this paper is not a defense of the Contractor, as against the Engineer or Architect, but is simply one advocating justice and equity to all parties to a contract. Destructive criticism is easy, but constructive criticism is of a different mold, and should always be welcomed among broad-minded men. In suggesting a new form of Agreement and Schedule of Conditions of Contract, it is hoped that something definite may be accomplished in righting the wrongs that most Engineers will readily admit exist, and nearly everyone has tried by different means to correct. The writer does not imagine that he has discovered some new and patentable truth, but hopes that his studies may have brought into concrete shape some practical suggestions for correcting well-recognized faults. After Engineers and Architects have set about putting their own houses in order, as typified by contract requirements, they can then more fearlessly demand that Contractors right the wrongs for which they alone are to blame.

DIVISIONS OF CONTRACTS.

Building contracts may be said to be divisable into four parts or divisions.

(1.)—*Matters Preliminary to Contracts*—Being the terms under which a contract is awarded, and giving the general information necessary before the execution of the agreement. It would include the "Form of Agreement" and "Schedule of Conditions of Contract" as given hereafter.

(2.)—*Agreement (or so-called Contract)*—Being the instrument executed between the Owner and Contractor, legally and formally binding them to fulfill their obligations. It should properly include the "Schedule of Conditions of Contract."

(3.)—*Specifications.*—Being the detailed written description of the method of construc-

*Abstract of a paper by Wm. B. Bamford Proceedings, American Society of Civil Engineers, Vol. XXXV, p. 1312.

tion and of the quality and kind of materials to be furnished.

(4.)—*Drawings.*—Being the detailed, graphic design of the work to be done, with the quantity and sizes of materials.

This paper treats only of the Agreement (or so-called Contract).

The Agreement, preferably, should not contain any matters concerning the details of construction, these belonging properly to the specifications. There are, however, a number of legal requirements which could be included in the Agreement or in the Specification. Legally, they would be just as binding in one as in the other. These matters will be mentioned under the heading "General Conditions."

REASONS FOR CONTRACTS.

A building contract is entered into by the owner in order to obtain the services of a contractor who is skilled in that particular kind of work, and by the contractor because he expects to make a certain profit in remuneration for his services and knowledge. Assured of his profit, it is immaterial to the contractor what kind of work the owner or Engineer may desire to have done, but if the contractor's profit is not assured, he becomes vitally interested in anything that may tend to affect his prospective profit. With the contractor, the work is purely a business proposition; he expects to make a certain profit for doing a particular amount of work. He must make a legitimate profit; his business life depends on it; and the more he feels this slipping away from him the more diligently will he find ways and means to reimburse himself. Even the best of contractors will try hard to obtain this profit in one way or another, else they must ultimately be forced from business and leave the field to those who are probably less competent contractors but shrewder business men.

A contract is intended to insure that an owner will obtain a definite piece of work for a stated sum and within a given time, and to insure that, for doing this, a contractor will be paid stated sums of money at definite times. The contract, therefore, should be drawn so that the owner can demand and obtain his work and the contractor his payments with the least delay and difficulty.

It is thought that the provisions of the Agreement and Schedule of Conditions of Contract given hereafter will protect more equitably the interests of all parties, and permit the engineer to enforce more certainly the proper fulfillment of the contract obligations than has been possible under the majority of such documents which have come to the writer's notice.

SYSTEMS OF CONTRACTING.

At present the systems of contracting used in building work may be divided into two general classes, the lump-sum system and the various percentage systems. They are often designated by the manner in which the work is to be paid for, as:

(1.)—Lump sum;

(2.)—Cost, plus a percentage;

(3.)—Cost, plus a percentage—where the general contractor takes estimates for subbranches of work, and makes lump-sum contracts, with the engineer's approval;

(4.)—Cost, plus a percentage, with guaranteed limit;

(5.)—Cost, plus a fixed sum;

(6.)—Cost, plus a fixed sum, with a bonus if cost is less than a fixed sum, and a penalty if it exceeds such sum.

Of these, the lump-sum system is the most usual, and is theoretically the best. Such a system pre-supposes that the contract defines the work to be performed, and that a contractor, therefore, can determine accurately what the execution of such work will cost. If, however, the contract requirements are indefinite, the contractor is never certain, no matter how conscientious he may be, that he may not be required, under broad or ambiguous clauses of the contract, to furnish more than he honestly understood would be required from his reading of the contract when estimating. Thus he may be forced to do work at a net loss instead of a profit. Under the various percentage systems, on the contrary, the contractor is assured of his profit, no matter how much work he may be required to do.

The lump-sum contract is superior to the percentage type because it more truly fosters fair and open competition, and is more economical, as has been demonstrated amply by many men of ripe experience. This presumes that the drawings and specifications describe completely and accurately everything that the contractor must do or furnish, especially where an expense is involved. If this is not done, the contractor's prices become mere gambles on probabilities, and not accurate estimates of actual costs plus a legitimate profit. In such a case is it to be wondered at that a contractor will fight at every legitimate opening in order to protect his final profit? He is not always able legally to demand additional compensation for the work which has actually cost him more than the estimated amount, therefore his only opportunity to make up his losses and come out with a fair total profit is by obtaining good prices for additional work, or, if it does not appear that there will be any such worth while, the contractor must find flaws in the contract and endeavor to get all the extra money he can, through technicalities or otherwise.

With the irresponsible or dishonest contractor there need be no sympathy, but by far the greater number of contractors only desire their legitimate profit, and the prospect of making a fair profit by hard, honest work is none too bright at the present time, under the usual lump-sum contract.

Contractors have found that the easiest and most practical way to overcome the disadvantages of the lump-sum estimates is by the various percentage systems. The contractor is thus assured of his profits, and the owner and engineer can change or increase the work to their hearts' content, as all additional expense involved is borne by the owner.

Assuming that the contractor is honest, and that the bills and statements he presents for payment are correct, and have all discounts, except a cash discount deducted, the cost of percentage work is apt to exceed the cost of work done under a lump-sum contract. The reasons for most of this increase are not hard to find. The contractor, not being responsible for the cost, and having his profits assured, readily makes any changes and does work as directed, no matter how expensive or uneconomical such work may be, and the owner does not realize how expensive his fads or fancies will be until the work is completed. Then again, if the percentage is based on the total cost, there is not the incentive for the contractor to become as zealous in obtaining the closest prices for materials as he would under a lump-sum contract.

Another most serious objection to percentage work is due to the fact that mechanics are inclined to loaf, even under the most careful supervision, and it is hard to get as much work out of them as under the lump-sum system. They seem to feel that as their employer, the contractor, will not suffer any loss, there will be no harm done, or they will not be in danger of losing their positions.

Many of the most serious objections to the percentage system have been overcome in varying degrees under systems 3, 4, 5, and 6. These systems have much to commend them, and, with all their faults, they will eventually supersede the lump-sum system, unless more care is taken to make contracts complete and accurate.

The English method of "Quantity Surveying" is another excellent attempt to overcome the worst objections to the lump-sum system of estimating, but, as at present in use, it would be too cumbersome for American practice. There the owner or engineer has the work to be done itemized in detail, and on this itemized statement, submitted to all contractors, they fill in their prices. These lists go into matters in minute detail, and, as all contractors estimate on the same list, the advantage is obvious. The Royal Institute of British Architects had approved forms, which are only slight modifications of the one for lump-sum contracting, in which the principal change is in making the "Quantities" a part of the contract. Under such a contract, the contractor would be able to obtain compensation for all items not mentioned specifically in the "Schedule of Quantities."

PRACTICAL AND EQUITABLE CONTRACTS.

Many contracts appear to be drawn by the engineer solely on the assumption that the owner's interests must be most carefully guarded against failure by the contractor to fulfill his agreements properly. In the past, when profits were sufficiently liberal, contractors could afford to take chances that "club-clauses" would not be strictly enforced, and profits lost by unfair clauses could be made up on "extras." Today, however, competition is sharper, and profits are too often figured on too slender a margin to permit a contractor to "take care" of losses caused by unfair clauses. No wonder, then, that the contractor becomes more and more technical and troublesome over small omissions or errors, whereas, before, he could charge these minor matters to profit and loss, or good-will. The chances which a contractor takes that an owner will not be fair-minded should not be overlooked. An owner may become very exacting, and may insist on "strict and literal" compliance with the letter of the specifications and contract, and may place an engineer in a very embarrassing position by referring to and insisting on the literal fulfillment of certain ambiguous conditions or the "taking of every pound of flesh," against the engineer's better judgment.

The value of a just contract to the owner and the engineer is as great as its value to the contractor. A just contract, provided it is accurate and free from ambiguity, cheapens the cost of work by eliminating the necessity for sums to cover possible contingencies; it broadens real competition, and encourages lower estimates; it ensures more rapid erection, and also acts as a powerful regulator of the mutual understanding and confidence in the fairness of all parties. Fairness, like oil for machinery, is necessary to prevent friction.

The agreement is only one of the divisions of a contract. It is the specifications and drawings, together, which must give the contractor a clear and complete knowledge of the work he must perform and the materials he must furnish, and should contain all the information necessary to permit him to make an accurate estimate and to carry out the work properly. The specification requirements should define clearly the result, the accomplishment of which is the object of the contract. It is a general statement of the work to be performed, a description of the materials, the quality required, and the workmanship to be performed, with definite limits as to what tests must be made in order to determine compliance with the requirements of the contract, or what defects would be sufficient cause for rejection.

Specification writing cannot be acquired successfully without practice and without broad knowledge, practical experience, and a careful study of the various materials and methods of construction and their relative costs. As ideas and methods change and improve, as a result of experience, so specifications should be changed to keep abreast of the times. An inexperienced writer is very apt to be uneven in his descriptions, writing at unnecessary length upon matters with which he is familiar, and covering his ignorance of equally important matters by the brief and ambiguous direction that "the work shall be done to the entire satisfaction of the engineer," "whose decision is to be final and binding on all parties." These statements are too often an admission that the engineer did not know what he desired, or that the owner had failed to express a preference and, therefore, had been left with unlimited future choice.

As previously stated, the ultimate object of a contract is to insure to the owner that he will obtain a definite finished product, of a

certain kind, for a particular cost, and in a given time; and to insure to the contractor that he will obtain certain sums of money at definite times for doing a definite amount of work; and the engineer is looked upon as the arbitrator or judge, to see that both parties receive their full justice under the contract. Contracts, therefore, should be drawn so that the owner can demand and obtain his work and the contractor his payments with the least delay and difficulty.

Engineers have always claimed to be arbitrators between owner and contractor, and not the representative solely of one party. This position is a proper one, but today it is more of a myth than a fact. The anomalous position is brought about, not because engineers are desirous of being unfair, but because of the agreements (or contracts) generally used, which make it extremely hard, if not almost impossible, for engineers to be fair if they try to conform to the agreement provisions.

It might be claimed that one of the most practical benefits to engineers and architects, in the more general use of an agreement similar to the one herein suggested, might be that it would not so insidiously "lead us into temptation" but would "deliver us" from many of the pitfalls lurking unsuspectingly around many present contracts.

While there is abundant room and great need for material improvement in specifications, it must be recognized that, with the limitations to the best of human endeavors, it will be extremely difficult, even for the most conscientious and painstaking, to prepare specifications for large work which may not contain some unfair requirements, when viewed from the contractor's standpoint. We can come near to the goal, certainly much nearer than is at present the practice, but possibly our slight oversight may mean a contractor's heavy loss.

The writer, therefore, strongly feels that one of the most practical steps toward the realization of contracts which will be fair and just to all parties will be made by the more general acceptance of the principles contained in the following forms of Agreement and Schedule of Conditions of Contract, and the adoption of similar provisions in contracts.

It is suggested that the following Agreement and Schedule of Conditions of Contract, be read through first as a whole, in order to obtain a general knowledge of their scope, omitting the reading of the notes following. They should then be read, article by article, with the comments after each.

AGREEMENT.

(For Lump-Sum Contracts.)

This Agreement, made the .... day of ....., in the year One Thousand and Nine Hundred and ...., by and between ....., of ....., hereinafter called the Contractor, and ..... of ....., hereinafter called the Owner.

Witnesseth, that the Contractor and Owner, for the considerations hereinafter named, agree as follows:

Article I. The Contractor agrees to provide all materials and perform all works for the (here briefly describe works) of a (here briefly describe type of building) at (here briefly describe location), shown on drawings numbered ..... and as described in the Specifications marked ....., prepared by ....., hereinafter called the Engineer; and to do all things required of him by the Drawings and Specifications and subject to the Conditions set forth in the Schedule hereto annexed (hereinafter referred to as "the said Conditions").

Article II.—The Contractor agrees to complete the works by and at the time or times hereinafter stated, to wit: .....

Liquidated damages should be a matter for special consideration in each separate contract. Many engineers and owners seem to desire them, possibly for the moral effect on contractors. The history of the legality of such provisions should cause them to be used with caution.

In many cases the following clause might be as far as it would be advisable to go toward obtaining just and reasonable damages for delay in completion:

The Contractor agrees that the time for completion of the works shall be considered as of the essence of the contract, and he agrees that for liquidated damages he will pay the Owner for the cost of all extra inspection, and for all amounts paid for rents, or for more protracted services on the part of the Engineer, or Clerk of the Works, or both, and other expenses entailed by the Owner by delay in completing the contract, and the Owner shall be entitled to retain from the amount otherwise to become due to Contractor an amount sufficient to reimburse properly the Owner for such expenses. Provided, however, that the sum collected as aforesaid for liquidated damages shall not exceed the sum of $.... for each and every day's delay not caused by the Owner, or otherwise as provided in the said Conditions, Section XXIV (subject to Arbitration).

Article III.—The Owner agrees to pay the Contractor for the execution of the contract ..... dollars ($.....) in current funds subject to additions and deductions as provided in the said Conditions, and upon the presentation of the certificates of the Engineer, as follows:

Before the ..... day of each month, the Contractor may submit to the Engineer a written statement showing (a) the value of the work and materials actually wrought into the building to the first of the month, (b) the value of materials delivered at the building but not incorporated into the work, and shall deduct the aggregate of previous payments. On or before the ..... day of the same month, the Engineer shall issue a certificate for .....% of the value of work as executed in the building, until the balance retained by the Owner amounts to the sum of $....., after which time the payments shall be for the full value of the work subsequently executed. The Contractor shall be entitled, under the certificate to be issued by the Engineer, to receive payment of ....., being a part of the said sum retained in hand when the works are practically completed, and in like manner to payment of the balance within a further period of ..... months, or as soon after the expiration of such period of ..... months as the work shall have been finally completed, and all defects made good according to the true intent and meaning hereof, whichever shall last happen. The Engineer, however, shall have authority to retain out of any monies actually due the Contractor only such sums as are provided by the said Conditions, Section XXX.

The manner of payment could be varied in many ways, as the conditions of the particular case made it necessary. The principle underlying the form suggested above, however, is important. As before stated, it is as essential that the contractor shall be able to demand and obtain his payments as that the owner shall be able to obtain the work for which he pays. In Article III the contractor's right to definite payments is expressed clearly. The engineer must issue a certificate for money due, and the owner must pay the amount due. It should be noted that the engineer is allowed ample discretionary power to withhold any money not justly due, as provided by Section XXX of the conditions. Thus the obligations become fairly clean cut. If the contractor's work is not done properly, there is ample power to withhold money to cover definite defects. On the other hand, if the engineer or owner withhold any payments without just cause, the contractor has recourse to arbitration, under Section XXXIV of the conditions, or to terminate the contract, under certain contingencies, as provided in Section XXXIII.

The idea of retaining percentages until the completion of the work is intended to insure its proper completion. The usual American practice of retaining an unchanging percentage from start to finish is unnecessarily extravagant, and in contracts involving large amounts is more harmful than beneficial. After the work has been approximately half completed, the remainder should be paid for in full without retaining a percentage. Of course, additional sums can be retained to cover known defects. The sum retained when the work is half completed is usually sufficiently liberal to cover possible contingencies, and is just as effectual as to continue to increase it until completion.

Article IV.—It is mutually agreed that the term "the Engineer" in the said Conditions shall mean the said ..... or in the event of his death or ceasing to be the Engineer, for the purpose of the contract, such other person as shall be nominated for that purpose by the Owner, not being a person to whom the Contractor shall object for reasons considered to be sufficient by the Arbitrators or Arbitrator mentioned in the said Conditions. Provided, always, that no person subsequently appointed to be Engineer under this contract shall be entitled to disregard or overrule any decision, or approval, or direction, given or expressed by the Engineer for the time being.

The purpose of Article IV is to cover cases which may be unusual but are generally very troublesome when they occur. It would prevent a subsequent engineer from altering at will matters of personal opinion or choice of his predecessor. No two minds are exactly alike, and few engineers or architects have exactly similar tastes. Should an engineer desire to change work which may be purely matters of opinion or judgment of both himself and his predecessor, such changes should not be paid for by the contractor, but by the owner, if he decides to follow the suggestions of his adviser. Of course defective work should be condemned at any time, when discovered Should an engineer desire to change some orders of his predecessor, and take the ground that certain work should be done as a part of the contract, he should not have arbitrary power to enforce his will, but could order the work done as provided by Section XVII of the Conditions, leaving to the Contractor the right of appeal to arbitration, under Section XXXIV., if he desires.

Article V.—It is mutually agreed that the said Conditions shall be read and construed as forming a part of this Agreement, and the parties hereto will respectively abide by and submit themselves to the conditions and stipulations, and perform the agreements on their parts, respectively, in such Conditions contained.

Article VI.—The Contractor and Owner, for themselves, their successors, executors, administrators, and assigns, hereby agree to the full performance of the covenants and agreements herein contained.

In Witness Whereof, the Contractor and Owner have hereunto set their hands and seals, the day and year first above written.

In presence of

.... [Seal]

SCHEDULE OF CONDITIONS OF CONTRACT.

1.—Drawings and Specifications.—The works shall be erected in accordance with the directions and to the reasonable satisfaction of the Engineer, in accordance with the Contract Drawings and Specifications, and in accordance with such further drawings, details, instructions, directions, and explanations as may from time to time be given by the Engineer. If the work shown on any such further drawings or details, or explanations be, in the opinion of the Contractor, extra to that comprised in the Contract, he shall, before proceeding with such work, give notice in writing to this effect to the Engineer. In the event of the Engineer and Contractor failing to agree as to whether or not there is any extra, and of the Engineer deciding that the Contractor is to carry out the said work, the Contractor shall accordingly do so, and the question whether or not there is any extra, and if so the amount thereof, shall, failing agreement, be settled by Arbitration, as provided in Section XXXIV, and the Contractor will be paid accordingly.

This section covers the troublesome question of work shown by details, etc., being in excess of the contract requirements. It might be reasonable to assume that the engineer would know better than anyone else whether his details require extra work, and the contractor should be permitted at any time to recover the value of such work upon proving that it was extra to the contract. There are many sound objections to such a course, and the more satisfactory of the two evils would seem to be to require the contractor to notify the engineer of any extra work, before proceeding with it, as a precedent to obtaining extra compensation.

II.—Contractor to Provide Everything Necessary.—The Contractor shall provide everything necessary for the proper execution of the works, within the limits established by the Drawings and Specifications, according to the true intent and meaning of the Drawings and Specifications taken together, whether the same may or may not be particularly shown on the Drawings or described in the Specifications, provided that the same is reasonably to be inferred therefrom; and if the Contractor finds any discrepancy in the Drawings, or between the Drawings and Specifications, he shall immediately refer the same to the Engineer, who shall decide which shall be followed. Figured dimensions shall be followed in preference to the scale, and figures on large-scale drawings shall take precedence over those at smaller scale.

III.—Copies of Drawings and Specifications.—The Contract Drawings and Specifications shall remain in the custody of the Engineer, and shall be produced by him at his office as and when required by the Contractor or the Owner. Three complete copies of all Drawings and of the Specifications shall be furnished by the Engineer, free of cost, to the Contractor, for his own use. The Engineer shall furnish to the Contractor within ..... days after the receipt by him of a request for the same, any details which, in the opinion of the Engineer, are necessary for the execution of any part of the work, such request to be made only within a reasonable time before it is necessary to execute such work in order to fulfill the contract. A complete set of such copies and details shall be kept on the works until the completion thereof, and the Engineer or his representative shall at all reasonable

times have access to the same, and, as instruments of service, all drawings are the property of the Engineer and shall be returned to the Engineer by the Contractor at the time of making the final payment under the contract.

IV.—Conform to Laws, Regulations, Etc.—The Contractor shall conform to the provisions of all the State building and sanitary laws, and with all municipal or local ordinances, rules, and regulations relating to building and to the preservation of the public health and safety, also with all regulations of the Board of Fire Underwriters and Fire Insurance Authorities having jurisdiction, and of any Water and Lighting Companies with whose systems the structure is proposed to be connected, and, before making any variations from the Drawings and Specifications that may be necessary by so conforming, shall give to the Engineer written notice, specifying the variation proposed to be made, and the reason for making it, and apply for instructions thereon. In case the Contractor shall not in due course receive such instructions, he shall proceed with the work, conforming to the provisions, ordinances, rules, and regulations in question, and the variation thus necessitated shall be dealt with under Section XXXIV. All contract requirements over, above, and beyond the said provisions, ordinances, rules, and regulations, shall be fully complied with. The Contractor, at his own expense, unless the law specifically requires the Owner to do so, shall obtain all necessary permits and licenses, give all necessary notices, and pay all legal fees.

The laws, ordinances, etc., of states and municipalities are often very divergent in their requirements, and in places positively contradictory. The meaning of many of their requirements, together with a great many of those of various fire insurance authorities, is not easy to determine by the most careful reading. Then again, the local authorities may have discretionary powers, and their "personal preferences" may be difficult to obtain, even by local men. Thus it would appear that, if an engineer cannot interpret correctly the local requirements in his drawings and specifications, it is unfair to place the responsibility, by a blanket clause, on the contractor. If, therefore, the authorities require work to be done in a different manner than that called for by the contract documents, and such work involves additional expense, the owner, and not the contractor, should pay for the same.

V.—Setting Out Work.—The Contractor shall set out the work in accordance with the Owner's survey and the Engineer's drawings, and, during the progress of the building, shall correct at his own expense any errors arising from inaccurate setting out, unless the Engineer shall decide to the contrary.

It is advisable that the owner have a survey made, and guaranteed, if desired, by some recognized title guaranty company. With this survey and the drawings, the contractor should be held to lay out the work correctly; but to renounce all responsibility for the survey or drawings and endeavor to place the responsibility for all conditions, both known and unknown, on a contractor, is not good business policy, nor keen professional foresight, though there may be specific cases apparently to justify such a course.

VI.—Foreman.—The Contractor shall keep constantly on the works a competent general foreman, and any directions or explanations given by the Engineer to such foreman shall be held to have been given to the Contractor.

VII.—Assignment of Contract.—The Contractor shall not, without the written consent of the Engineer, assign this agreement, and, before subletting any portion of the works, shall notify the Engineer of such fact, in writing. No sub-contractors, to whom the Engineer has made written objections, shall be employed, and the Contractor shall assume full responsibility for all his sub-contractors.

Sub-contractors are not legally recognized as parties to a contract, but, in many cases the power is assumed of dictating to a contractor what persons he must employ as sub-contractors. Such a course is not only unfair, but might cause legal difficulties later should the contractor take the ground that he is not responsible for the acts of a sub-contractor not of his own selection, but who was forced upon him by the engineer or owner. In the foregoing section the engineer may disapprove of sub-contractors who are not satisfactory, but he is not permitted to dictate who must be employed as sub-contractors. Where the engineer approves a sub-contractor, it can be implied that he considers that the person whom he may approve will be satisfactory, while, by confining himself to the disapproval of unsatisfactory sub-contractors, no such satisfaction can be implied, as the persons finally employed may be entirely unknown to the engineer.

VIII.—Work by Other Contractors.—The Contractor shall permit the execution of work by any other mechanics or trades employed by the Owner, and shall afford them every reasonable facility for the proper erection of their work. The Owner agrees not to employ any other mechanics or trades on the work against whom the Contractor shall make what the Engineer considers a reasonable objection, or who will not enter into a contract with the Contractor guaranteeing the due performance of his work and indemnifying the Contractor against valid claims which may arise during the performance of the work.

The object of this section is simply to minimize the chances for disagreement between independent contractors and their making claims to the owner for damages done to them by other contractors. By this section, if a general contractor is responsible for the completion of certain work, he is permitted to make reasonable objection to other independent contractors before they are employed, and to exact a warranty for valid claims arising out of the work. If they agree to indemnify each other, the owner has then fulfilled his obligations; then any disagreements must be settled between the individual contractors, and the owner can demand with a clear conscience that they shall perform their contract obligations, and settle their own differences.

IX.—Materials, Etc., to Conform to Specifications.—All materials and workmanship shall be of the respective kinds described in the Specifications, and the Contractor, upon the request of the Engineer, shall furnish him with vouchers to prove that the materials are such as are specified. The Contractor shall also furnish duplicate labeled samples of materials and workmanship, for the Engineer's approval, and the materials and workmanship furnished shall be equal to the approved samples.

X.—Dismissal of Workmen.—The Contractor, on the written request of the Engineer, shall immediately dismiss from the works any person employed thereon by him, who, in the opinion of the Engineer, may be incompetent, or who misconducts himself, and such person shall not be again employed on the works without the permission of the Engineer.

XI.—Access to Work.—The Engineer and any person authorized by him shall at all reasonable times have access to the works, and the Engineer and his representatives shall at like times have access to the workshops of the Contractor or other places where work is being prepared for the building.

XII.—Clerk of Works.—The Clerk of the Works or other representative shall be considered to act solely as inspector, and under the Engineer, and the Contractor shall afford him every facility for examining the works and materials. The Clerk of the Works or other representative shall have no power to revoke, alter, enlarge, or relax any requirements of the contract, except in so far as such authority may be specifically conferred by a written order of the Engineer.

XIII.—Work to Be Opened Up.—The Contractor, at the request of the Engineer, and within such times as the Engineer shall name, shall open for inspection any work covered up; and should the Contractor refuse or neglect to comply with such request, the Engineer may employ other workmen to open up the same. If the said work has been covered up in contravention of the Engineer's instructions, or if, on being opened up, it is found to be not in accordance with the Drawings and Specifications or the instructions of the Engineer, the expense of opening and covering it up again, whether done by the Contractor or such other workmen, shall be borne by, and shall be recoverable from, the Contractor, or may be deducted, as hereafter provided. If the work has not been covered up in contravention of such instructions, and be found in accordance with the said Drawings and Specifications or instructions, then the expense aforesaid shall be borne by the Owner and be added to the contract sum; provided always that in the case of foundations, or other urgent work thus opened up and requiring immediate attention; the Engineer, within a reasonable time after the receipt of notice from the Contractor that the work has been so opened, shall make or cause the inspection thereof to be made, and at the expiration of such time, if such inspection shall not have been made, the Contractor may cover up the same, and shall not be required to open it up again for inspection except at the expense of the Owner.

This section seems to indicate the fairest practical way of solving a perplexing problem.

XIV.—Removal of Work.—During the progress of the works, the Engineer shall have power to order in writing from time to time the removal from the works, within such reasonable time or times as may be specified in the order, of any materials which in the opinion of the Engineer are not in accordance with the Specifications or the instructions of the Engineer, the substitution of proper materials, and the removal and proper re-execution of any work executed with materials or workmanship not in accordance with the Drawings and Specifications or instructions; and the Contractor shall forthwith carry out such order at his own cost. In case of default of the Contractor to carry out such order, the Owner shall have power to employ and pay other persons to carry out the same; and all expenses consequent thereon or incidental thereto shall be borne by the Contractor, and shall be recoverable from him by the Owner, or may be deducted by the Owner from any monies due or that may become due to the Contractor. If, in the opinion of the Engineer, it is not expedient to remove materials delivered or alter work done which is not in accordance with the contract, the Owner may deduct the difference in value of the materials as delivered and the work as done and that required by the Drawings and Specifications, together with a fair amount for damages, which sum shall be determined by the Engineer (sub-

XV.—Defective Work.—Any defects, shrinkage, or other faults which may appear within ..... months from the completion of the works, and, in the opinion of the Engineer, arising from materials or workmanship not in accordance with the Drawings and Specifications or the instructions of the Engineer, or any damage to pointing by frost appearing within the like period, shall, upon the direction in writing of the Engineer, and within such reasonable time as shall be specified therein, be amended and made good by the Contractor at his own expense, unless the Engineer shall decide that he ought to be paid for the same; and, in case of default, the Owner may employ and pay other persons to amend and make good such defects, shrinkage, or other faults or damage, and all expenses consequent thereon or incidental thereto shall be borne by the Contractor and shall be recoverable from him by the Owner from any monies due or that may become due to the Contractor. Should any defective work have been done or should any defective materials be supplied by any sub-contractor employed on the work who has been nominated or approved by the Engineer, as provided in Sections VII and XXIX, the Contractor shall be liable to make good in the same manner as if such work or materials had been done or supplied by the Contractor and had been subject to the provisions of this and the preceding Section.

XVI.—Copy of Quantities, Etc.—The Contractor, if required before executing this agreement or before making application for any payment, shall furnish to the Engineer, upon a blank form prepared by him, a correct, verified, itemized statement, showing the quantities of labor and materials that will be required to perform the principal items of the contract, together with their prices; and the amount included in his estimate for each general item of work to be furnished complete and in position, including in each item its due proportion of expense and profit, the sum of the different items equaling the total amount of the proposal. The above schedule shall be for the use of the Engineer, at his discretion, only in preparing estimates for payments on account to the Contractor.

If this section is read in connection with Sections XVII and XVIII, it will be seen that possibly many apparently desirable modifications are covered by the provisions of these two sections.

XVII.—Variation and Extras.—The Contractor, when authorized by the Engineer, or as provided by Section IV, shall vary by altering, adding to, or deducting from the contract requirements; such authorization is to be sufficiently proven by any writing or drawing signed by the Engineer, or by any subsequent written approval by him, but the Contractor shall make no variation without such authorization. No claim for extra compensation will be allowed unless it shall have been executed under the provision of Section IV, or by the authority of the Engineer, as herein mentioned. Such an extra is hereinafter referred to as an authorized extra.

Variations in the contract (or extras) is one of the most troublesome phases of lump sum contract work. By the provisions of this section and Section XVIII, with the final redress to arbitration under Section XXXIV, it is hoped, that the greater part of such controversies can be adjusted satisfactorily.

XVIII.—Price for Extras.—No variation shall vitiate the contract; but all alterations, additions to, or deductions from the contract requirements, which may have been made with the authority of the Engineer, or without his authority, provided he gives subsequently a written sanction to such omission, shall be valued in one of the four following ways, as may be selected by the Owner:

A.—By Estimate and Acceptance of a Lump Sum. The Contractor shall submit an estimate for making the variation contemplated, and in case an agreement as to price cannot be reached, the Engineer may order the work to proceed and the Contractor shall forthwith proceed with such variation and leave the price to be settled by Arbitration. A tentative amount, however, will be allowed by the Owner, equal to the proportion of the amount of the estimate conceded by both the Owner and Contractor, and payments will be made on the basis of such amount "without prejudice" until the correct amount shall be determined by Arbitration.

B.—By Unit Prices. Where the Contractor shall have given, in his estimate for the contract, or in subsequent accepted estimates, unit prices for specified parts of the work, the Engi-

neer may make an award of a sum based on these unit prices, subject to Arbitration.

C.—By Net Cost. In this case the Contractor will be paid the actual net amount paid by him for materials; after all trade discounts, except a bona fide cash discount, have been deducted, plus the cost of labor or material required to erect and finish the work properly; plus ....% for profit, general office superintendence, and other general office expenses not peculiar to this contract; plus ....% per month on the actual cost for reproducing the plant as used for such extra work, for plant rental. The total net cost shall not exceed the usual reasonable cost for similar work, unless the Contractor can prove conclusively that the excess was due to exceptional and unavoidable difficulties or conditions At required intervals, of not less than seven days, the Contractor shall render detailed statements and vouchers, and the Engineer will award an amount as the net cost, subject to Arbitration. In variations involving the omission of work, the amount to be deducted for such omission shall be based on the net cost as given above, plus ....% for prospective profit.

D.—By Cost Plus a Lump Sum. In such cases the Contractor shall submit an estimate which he agrees the variation shall not exceed, plus a sum for profit. The Contractor, at required intervals, of not less than seven days, shall render detailed statements and vouchers of the net cost, on the same basis as given under "C" above, except that no profit shall be included. If the actual cost is less than that given in his estimate, the Contractor shall receive, in addition to the lump sum profit, ...% of the difference between the actual cost and the amount of his estimate. If the actual cost is greater than that given in his estimate, the Contractor shall receive, in addition to the amount of his estimate, only ....% of the difference between the actual cost and the amount of his estimate.

The foregoing methods of determining the price to be paid for variations to the contract (or extras) with the redress to Arbitration (Section XXXIV), is in principle the most equitable method that has come to the writer's notice, for solving one of the most vital parts of a contract—the proper compensation for legitimate extra work. This section, in detail, is entirely different from anything which the writer has seen in use, and he suggests for it special consideration. In principle, it is similar to the requirements of the Royal Institute of British Architects.

XIX.—Damage to Persons and Property.—The Contractor shall indemnify and save harmless the Owner from any and all claims and demands which may be made by reason of (1) any injury or damage suffered or sustained by any person or corporation, caused by, or alleged to have been caused by, any act or omission of the Contractor or his agents, servants, workmen, employes, or sub-contractors, in the course of the performance of the work; and (2) any injury or damage suffered or sustained by any such agents, servants, workmen, employes, or sub-contractors, however caused, in or about said building; and the Contractor, at his own cost, expense, and risk, shall defend any and all actions, suits, or other legal proceeding that may be brought or instituted against the Owner on any such claim or demand, and pay and satisfy any judgment that may be rendered against the Owner in any such action, suit, or other legal proceeding, or result thereof; provided, however, that this section shall not be construed as an assumption by the Contractor of any liability to the Owner for any injury or damage caused by an employe of the Owner who is not a Contractor or sub-contractor, or an agent, servant, workman, or employe of a Contractor or sub-contractor engaged in the performance of work in or about said building.

XX.—Damage to Work.—The Contractor shall assume the responsibility for, and repair at his own expense, all damage to his work, or the work of other Contractors, or to the building and contents, caused by the installation of work or by th carelessness or negligence of himself, his sub-contractors, or employes. He shall also be responsible for, and make good, any damage to adjoining property, caused by any movement or settlement, or by material or implements falling upon the same during construction, or for any other cause for which the Owner may be held liable, and shall thoroughly complete the whole of the works.

XXI.—Patent Infringement, Etc.—The Contractor shall indemnify and save harmless the Owner from any and all claims and demands which may be made by reason of any infringement, or alleged infringement, of any patent, patent rights, or claim, caused, or alleged to have been caused, by the use of any apparatus or appliances, or portions thereof, furnished or installed by the Contractor; and the Contractor, at his own cost, expense, and risk, shall defend any and all actions, suits, or other legal proceedings that may be brought or instituted against the owner on any such claim or demand, and pay and satisfy any judgment or decree that may be rendered or adjudged against the Owner in any action, suit, or other legal proceeding or result thereof.

XXII.—Insurance.—During the progress of the works, the Owner will maintain insurance on said works, in his own name and in the name of the Contractor, against loss or damage by fire or lightning, and the policies will cover all work incorporated in the building, except that of excavation and foundations below the level of the ground, and all materials for same in or about the premises, and be made payable to the Owner, for adjustment between the parties hereto, as their interests may appear. At the end of each month the Contractor shall deliver to the Owner a statement showing the total value of work done and materials delivered, as herein described, to that date, and the owner will maintain said insurance in accordance with the latest statement thus delivered.

The objection to most insurance clauses is the difficulty of adjusting properly the interests as they may appear. Fire insurance companies usually hold such payments until both parties sign an agreement stating the proportionate amounts each party is to receive. This adjusting, in case of a disagreement, may consume considerable time and delay the continuance of the work. Under Section XXII. the amount of the insurance is payable directly to the owner, and as he receives monthly a statement from the contractor and insures the contractor in accordance with such statement, it is fairly simple to estimate the contractor's loss at any time. If the owner neglects to insure himself properly, he then has no one but himself to blame.

XXIII.—Damages for Delay.—Should the Owner claim damages for delay in the completion of the works, the Engineer, if, in his opinion, any damages be payable, will make an award on the basis stated in the Agreement, and will write the amount across the face of the final certificate as "the amount to be deducted from the face hereof for delay in completion of the work" (subject to Arbitration). Thereupon the Engineer's services in this matter shall terminate, except as provided under Section XXXIV.

Should the Contractor, by his own fault or negligence, unnecessarily delay the completion of the work, thereby necessitating unusual or more protracted services on the part of the Engineer or the Clerk of the Works, or both, the Owner shall be entitled to retain from the amount otherwise to become due the Contractor an amount sufficient to reimburse properly either the Engieer or the Clerk of the Works, or both, for such protracted or unusual services (subject to Arbitration).

This section should be read in connection with any damages to be allowed under Article II. of the Argeement. It should be distinctly stated in the Agreement whether or not the specified sum for damages includes the protracted service of the engineer, etc., herein mentioned. In many cases compensation for such protracted service might be all the damage that should justly be demanded.

XXIV.—Extension of Time.—If, in the opinion of the Engineer, the work be delayed by force majeure or by reason of any exceptionally inclement weather, or by reason of, instructions from the Engineer in consequence of proceedings taken or threatened by, or disputes with, adjoining or neighboring owners, or by the work or delay of other Contractors or mechanics engaged or nominated by the Owner or the Engineer, and not referred to in the Specifications, or by reason of authorized extras or additions, or in consequence of any notice reasonably given by the Contractor in pursuance of Section IV, or by the combined action of workmen, in no wise caused by or resulting from default or collusion on the part of the Contractor, or in consequence of the Contractor not having received in due time necessary instructions from the Engineer for which he shall have specifically applied in writing, the Engineer will make a fair and reasonable extension of time for completion in respect thereof. In case of such combined action of workmen, the Contractor shall, as soon as may be, give to the Engineer written notice thereof; but the Contractor shall, nevertheless, use his best endeavors to prevent delay, and shall do all that may reasonably be required, to the satisfaction of the Engineer, to proceed with the works.

The usual practice is to grant an extension of time to a contractor equal to the time which he may be delayed, provided he gives notice of such delay within 48 hours. The reasons for which extensions may be granted are usually very few, and not always of the most importance. The section suggested above will probably be objected to as not definitely specifying the length of the extension of time that may be allowed. The engineer is empowered to make a fair and reasonable extension of time for completion, and he can thus take into account matters which it would be hard to cover by an arbitrary clause. Should either party feel aggrieved by the length of time of the extension, it has the right of appeal to arbitration (Section XXXIV).

XXV.—Suspension of Work by Contractor.—If the Contractor, except on account of any legal restraint upon the Owner preventing the continuance of the works, or on account of any of the causes mentioned in Section XXIV, or in case of any certificate being withheld or not paid when due, shall suspend the works, or, in the opinion of the Engineer, shall neglect or fail to proceed with due diligence in the performance of his part of the contract, or if he shall more than once make default in the respects mentioned in Section XIV, the Owner, by the Engineer, shall have power to give notice in writing to the Contractor requiring that the works be proceeded with in a reasonable manner and with reasonable dispatch. Such notice shall not be unreasonably or vexatiously given, and must signify that it purports to be a notice under the provisions of this section, and must specify the act or default on the part of the Contractor upon which it is based. After such notice shall have been given, the Contractor shall not be at liberty to remove from the site or works, or from any ground contiguous thereto, any plant or materials belonging to him which shall have been placed thereon for the purpose of the works; and the Owner shall have a lien upon all such plant and materials, to subsist from the date of such notice being given until the notice shall have been complied with. Provided always that such lien shall not, under any circumstances, subsist after the expiration of thirty-one days from the date of such notice being given, unless the Owner shall have entered upon and taken possession of the works and site, as hereinafter provided. If the Contractor shall fail for .... days after the time given in such notice to proceed with the works as therein prescribed, the Owner shall be at liberty to provide any such labor or materials, and to deduct the cost thereof from any money then due or thereafter to become due to the Contractor under the contract.

The general purport of this section is similar to the majority of similar American clauses. Its wording, however, is freer from uncertainties and deserves careful attention.

XXVI.—Termination of Contract by Owner.—If the Contractor shall fail for .... days after such notice has been given as provided in Section XXV, to proceed with the work as therein prescribed, and if the Engineer shall then certify that such refusal, neglect, or failure is sufficient ground for such action, the Owner may enter upon and take possession of the works and site, and of all plant and materials thereon (or on any ground contiguous thereto), intended to be used for the works, and all such materials as above mentioned shall thereupon become the property of the Owner absolutely, and the Owner shall retain and hold a lien upon all such plant until the works shall have been completed under the powers hereinafter conferred on him. If the Owner shall exercise the above power he may engage any other person to complete the works, and exclude the Contractor, his agents, and servants, from entry upon or access to the same, except that the Contractor or any one person nominated by him may have access at all reasonable times to inspect, survey, and measure the works. And the Owner shall take such steps as, in the opinion of the Engineer, may be reasonably necessary for completing the works without undue delay or expense, using for that purpose the plant and materials above mentioned, in so far as they are suitable and adapted to such use. Upon the completion of the works, the Engineer shall certify the amount of the expense properly incurred consequent on and incidental to the default of the Contractor as aforesaid, and in completing the works by other persons. Should the amount thus certified as the expenses properly incurred be less than the amount which would have been due to the Contractor upon the completion of the work by him, the difference will be paid to the Contractor by the Owner; should the amount of the former exceed the latter, the difference shall be paid by the Contractor to the Owner. The Owner will not be liable to make any further payment or compensation to the Contractor for or on account of the proper use of the plant for the completion of the works under the provisions hereinbefore contained other than such payments as are included in the contract price. After the works shall have been thus completed by persons other than the Contractor, under the provisions hereinbefore contained, the Owner shall give notice to the Contractor of such completion, and may require him from time to time, before and after completion, to remove his plant and all such materials as aforesaid as may not have been used in the completion of the works, from the site. If such plant and materials are not removed within a reasonable time after notice shall have been given, the Owner may remove and sell the same, holding the proceeds, less the cost of their removal and sale, to the credit of the Contractor. Any notice to be given to the Contractor under this clause shall be given by leaving the same at the place of business of the Contractor, or by a registered letter sent to him at that address.

This section conforms in substance to the generally accepted American practice, but its wording is more definite, and it leaves fewer loop holes for argument or controversy:

XXVII.—Net Cost.—The words, "Net Cost," or the initials, "N. C.," used in the Specifications, for materials to be obtained and installed by the Contractor, shall mean, unless otherwise stated in the Specifications, the sum paid to merchants, after deducting all trade discounts, for such materials, in the ordinary course of delivery, but not deducting discount for cash, and such sum shall be exclusive of special cartage, the cost of installation, and Contractor's profit.

XXVIII.—Provisional Sums.—The provisional sums mentioned in the Specifications for materials to be supplied or for work to be performed by special contractors or mechanics, or for other works or fittings to the building, shall be paid and expended at such times, and in such amounts, and to and in favor of such persons, as the Engineer shall direct, and sums thus expended shall be payable by the Contractor without deduction or discount, or (without prejudice to any rights of the Contractor existing under the contract referred to in Section XXIX) by the Owner to the said Contractors or mechanics. The value of works which are executed by the Contractor in respect of provisional sums, or in additional works, shall be ascertained as provided by Section XVIII. At the settlement of accounts the amount paid by the Contractor to the said contractors and mechanics, and the said value of such works executed by the Contractor, shall be set against all provisional sums or any sum provided for additional works, and the balance, after allowing pro rata for the Contractor's profits at the rate of ....%, unless different rates are contained in the Contractor's original estimate, shall be added to or deducted from the contract sum, provided that in estimating the amounts paid as last herein provided no deductions shall be made by or on behalf of the Owner in respect of any damages paid by the sub-contractor to the Contractor, the intention being that the Contractor and not the Owner shall have the benefit of any such damages.

There are many cases where important matters may not be definitely determined before the execution of a contract. The practice in many cases is to insert a blanket clause giving almost unlimited selection to either owner or engineer. In such case a contractor must make a shrewd guess at the amount to include in his estimate, or something as nearly as possible to what may be required may be specified and afterward the problem is to reconcile the cost of the work as specified with the work as required. The idea of having provisional sums inserted in a contract to cover matters not distinctly determined is not new but the above section may suggest a wording which will overcome many of the previous objections to such provisional sum clauses.

XXIX.—Sub-Contractors. — All contractors, merchants, mechanics, or others executing any work, or supplying any materials for which net cost prices or provisional sums are included in the Specifications, who may at any time be nominated, selected, or approved by the Engineer are hereby declared to be sub-contractors employed by the Contractor; but no sub-contractor shall be employed upon the works against whom the Contractor shall make what the Engineer considers reasonable objections, or who shall not enter into a contract with the Contractor upon terms and conditions consistent with those in this Contract, and securing the due performance and maintenance of the works supplied or executed by such sub-contractors, and indemnifying the Contractor against any claims arising out of the misuse by the sub-contractor or his workmen of any scaffold erected or plant used by the Contractor, or that may be made against the Contractor in consequence of any act, omission, or default of the sub-contractor, his servants or agents, and against any liability, as given under Sections XIX, XXI, or XXII.

This section is intended to cover cases where it becomes desirable to have special contractors execute work covered by provisional sums. In many cases particular types or makes of articles cannot be obtained excepting from special parties. To require a contractor to employ such parties and not be relieved from responsibility for their actions is a difficult problem. This section will prevent a contractor who may be under heavy penalty to complete his work from being compelled to employ a particular contractor for a sub-branch who may absolutely refuse to indemnify the contractor if he fails to complete his work on contract time or to give a warrant for the faithful performance of the work.

XXX. Payment and Certificate. The Engineer shall issue his certificates for payments due the Contractor in accordance with the terms of the Agreement, provided, however, that the Engineer may withhold only such proportion of any sum due as in his judgment will cover the expense of the liens as given under Section XXXI, or of correcting such violation as given in Section XIV, and such payments shall not become due until violations are properly corrected (subject to Arbitration) or the liens are removed as hereinafter provided. No certificate given or payment made under the contract, nor partial or entire occupancy of the building by the Owner, shall be construed as an acceptance of defective work, or of improper materials, or as condoning any omission, provided, however, that in the case of a partial or entire occupancy of the building by the Owner, the Contractor shall have been given notice of all defects or omissions reasonably noticeable before such occupation. No certificate, final or otherwise, shall be construed as relieving the Contractor from his obligations to make good any defects discovered in his work after the completion and acceptance of the same, nor as a waiver of any specific obligation the Contractor may have assumed as to the durability of his works. The acceptance by the Contractor of the payment of the final certificate shall constitute a waiver of all claims against the Owner under or arising out of the contract. The Contractor, before each payment falls due, shall submit to the Engineer a requisition therefor and shall, if required, submit therewith an itemized statement of the quantities and value of works in general items performed to date, and such statements shall be made in form provided or approved by the Engineer.

The provisions of this section are of great importance in any contract. Its importance is in its wording and not because it contains any new principle.

XXXI.—Lines.—If at any time there shall be evidence of any lien or claim, for which, if established, the Owner or the premises might be made liable, and which would be chargeable to the Contractor, the Owner shall have the right to retain out of any payment then due, or thereafter to become due, an amount sufficient to indemnify himself against such lien or claim until the same shall be effectually discharged, or bonded; and should there prove to be any such claim after all payments are made, the Contractor shall refund to the Owner all moneys that the latter may be compelled to pay in discharging any lien upon said premises made obligatory in consequence of the Contractor's default. Before the final payment shall become due, the Contractor shall deliver to the Owner a satisfactory release of all liens against the premises on the part of all persons who have delivered materials for use in, or performed work on, said premises, including a release from the Contractor himself.

XXXII.—Unfixed Materials.—When the Contractor shall have received payment of any certificate in which the Engineer shall have stated that he has taken into account the value of any unfixed materials intended for the works, and placed by the Contractor thereon, or upon ground adjacent thereto, all such materials shall become the property of the Owner, and shall not be taken away, except for the purpose of being used on the building, without the written authority of the Engineer; and the Contractor shall be liable for any loss of or damage to such materials.

XXXIII.—Termination of Contract by Contractor.—Should the Owner not pay the Contractor any sum certified by the Engineer within the times respectively named in the Agreement, the Contractor shall give to the Owner written notice of the non-payment, and should the Owner not pay any such sum within the period of .... days from the date of delivery of such notice at the Owner's address, or sent to him there in the ordinary course of mail by registered letter, or if the Owner shall become bankrupt or file any petition for liquidation of his affairs, and if his Receiver in Bankruptcy shall repudiate this contract, or if the Receiver shall be unable to show, within .... days, to the reasonable satisfaction of the Contractor, his ability to carry out the contract, and to make all payments due or to become due thereunder, or if the works be stopped for .... months, under an order of the Engineer or any Court of Law, the Contractor shall be at liberty to terminate the contract by notice in writing to the Engineer, and to recover from the Owner payment for all work executed and for any loss he may sustain upon any plant or material supplied or purchased for the purpose of the contract. In ascertaining the amount of such payment, the rates contained in the Contractor's original estimate shall be followed, or, where the same may not apply, rates proportionate to the prices therein contained, as far as the same are applicable.

Few American contracts contain any provision permitting a contractor to terminate a contract on any condition whatsoever. In fact most contracts are filled with clauses designed to bind a contractor hand and foot so that no matter what may happen he is certain to remain a party to the contract. The absolute unfairness of many such requirements is hard to account for except that they have been inherited from times when work and conditions were totally different from those existing today. The fairness of engineers including within contracts a section similar to the above should be apparent from a careful reading of the section.

XXXIV. Arbitration. Provided always that in case any dispute or difference shall arise between the Owner, or the Engineer on his behalf, and the Contractor, either during the progress of the works or after the termination, abandonment, or breach of the contract, as to the construction of the contract or as to any matter or thing arising thereunder (except as to matters left to the sole discretion of the Engineer under Sections II, VII, X, XIV, and the exercise by him, under Section XIII, of the right to have any work opened up), or as to the withholding by the Engineer of any certificate to which the Contractor may claim to be entitled, then either party shall forthwith give to the other notice of such dispute or difference, and such dispute or difference shall be and is hereby referred to the arbitration and final decision of three disinterested arbitrators, one chosen by the Owner, one by the Contractor, and the third chosen by these two arbitrators. The decision of any two of these arbitrators shall be final and binding on both parties hereto. If the parties hereto mutually agree, one arbitrator may be appointed in place of the three named as above, and his decision shall be final and binding on both parties.

When the time for submitting matters to arbitration, as herein provided, has arrived, either the owner or the Contractor may appoint an arbitrator and demand the appointment of an arbitrator by the other party. Should the party filing notice of appeal to arbitration as herein provided fail to choose an arbitrator or to agree on a single arbitrator within seven days after receiving a written request from the other party, his right to arbitration in such matters shall lapse; should the other party fail to choose an arbitrator or to agree on a single arbitrator within seven days after receiving a written request so to do, then such dispute or difference shall be and is hereby referrd to the arbitration and final decision of ....., or in the event of his death, or unwillingness or inability to act, of ....., or in the event of his death, or unwillingness or inability to act, of a person to be appointed on the request of either party after giving notice to the other party, by the President for the time being of the American Institute of Architects or of the American Society of Civil Engineers, and the award of such arbitrator shall be final and binding on both parties.

Such reference, except on the question of certificate, shall not be opened up until after the completion or alleged completion of the works, unless with the written consent of the Owner or Engineer and the Contractor. The arbitrator, or arbitrators, shall have power to open up, review, and revise any certificate, opinion, decision, requisition, or notice, save in regard to the said matters expressly excepted above, and to determine all matters in dispute which shall be submitted to him or them, and of which notice shall have been given as aforesaid, in the same manner as if no such certificate, opinion, decision, requisition, or notice had been given. Should either party refuse, or neglect, to supply the arbitrator or arbitrators with any papers or information considered necessary by him or them to arrive at a decision in the matters referred to him or them, which papers or information have been specifically demanded in writing, he or they are hereby authorized and empowered by both parties to the contract to proceed in ex parte proceedings, and such proceedings shall be final and binding.

Upon every or any such reference, the costs of and incidental to the reference and award, respectively, shall be in the discretion of the arbitrator or arbitrators, who may determine the amount thereof, or direct the same to be taxed as between attorney and client, or as between party and party, and shall direct by whom and to whom and in what manner the same shall be borne and paid.

This section caused more debate among the members of the Royal Institute of British Architects and more differences of opinion between the British architects and builders than all the other sections combined. The discussion on this subject in the Journal of the Royal Institute of British Architects is especially worthy of study.

The importance of this section justifies the most careful study which can be given to it. Around it would center the much discussed authority of the engineer or architect to settle all matters of every kind and description. Every one who has exercised such powers must realize that while they are theoretically desirable, their proper curtailment would unravel a very difficult situation, and would permit questions being considered in a more equitable light for all parties.

The usual American arbitration clause is a delusion and a snare to all parties. Many have felt that it was a guaranty of redress for possible wrongs, only to be awakened when its provisions were called into action.

It should be noted, of course, that the English "arbitration act, 1889," is a very practical document, and probably gives more legal security to the enforcement of arbitration clauses than would be possible under the laws of most of the states. Arbitration clauses are used in many contracts, and they should be made as practical and workable as possible, then if it is found that even under the most practical of clauses the state laws need strengthening to make the term "arbitration" a reality and not a myth, there would be a good foundation on which to advocate an arbitration act similar to the English statute.

The above section leaves the engineer as the deciding party between both owner and contractor, but should either party formally dissent from his decision, a notice can be given of an appeal to arbitration. Such appeals, however, will not be actually submitted to the arbitrators until the substantial completion of

the work. This seemed to be the point of greatest disagreement between the British architects and builders. The former indorsed the above procedure, while the builders desired the matters to be submitted to arbitrators at any time. The objection to permitting submissions at any time is that, under the broad powers which it is desirable to grant to arbitrators, it would cause confusion during construction, and make it possible to confuse hopelessly the power of the engineer and the arbitrator. After the substantial completion of the work such conflict cannot well arise. The engineer being supreme during construction and after completion, the arbitrator has power to review only certain of the engineer's decisions to which written exception has been taken, as herein provided. Of course, in the matters which are referred to arbitration, the decision of such arbitration is final. Such a policy, by its very broadness, would tend to make owners, engineers, and contractors more willing to listen and consider the grievances, real or imaginary, of the other parties.

Section XXXV is intended to dissuade both parties from taking unnecessary or trivial appeals from an engineer's decision.

While the foundation of the arbitration section is laid on the lines of that of the Royal Institute of British Architects, it differs in many details.

XXXV.—Damages for Submission to Arbitration.—In submitting to arbitration questions in dispute, or differences involving a variation in the amount of the contract, both the Owner and the Contractor shall have the option of submitting their appeals in separate items or groups of items. In which case the arbitrators or arbitrator, in awarding a judgment on each item or group of items, are authorized and directed by both parties to the contract, to award to the party whose contention is sustained, in addition to the sum actually determined as correct, an amount equal to ....% of such amount. Such additional sum shall be added to or deducted from the amounts in question as the case may require. Should a claim be set aside in whole, or should the nature of the case otherwise require it, the amount of such additional award shall be added to or deducted from the amount due the Contractor on the contract. These additional sums shall be considered as damages for the time and trouble incident to such appeal.

The object of this section is to act as a check to prevent appeals to arbitration becoming the fashion rather than the exception. While the principle of this section is considered good, the ability to enforce it is not settled in the writer's mind.

GENERAL CONDITIONS.

The endeavor has been to make the agreement and schedule of conditions of contract as broad and general as is consistent with good practice. There are additional conditions which may be desirable or essential for particular buildings, but as these conditions are special and of only limited, if not personal, application, it is unwise to attempt to write such in a general set of conditions of contract.

Legally such conditions would be just as binding upon a contractor whether they were given as a part of the agreement or were placed in the specifications. The writer, therefore, advocates placing in the fore part of a specification a chapter headed "General Conditions," under which would be placed special requirements of a more or less legal and general nature, which, for the purpose of the particular building, might have been made a part of the schedule of conditions of contract.

The following are given as samples of clauses which might be found under a heading "General Conditions." It must be distinctly understood that these clauses are given only as samples, without comment. The writer does not indorse them for general use and except in isolated cases he considers that many of the provisions might be more harmful than beneficial.

Checking Documents.—The Contractor shall carefully study and compare all drawings, specifications, and other information given to him by the Engineer, both as to figures, materials, and methods of construction, and shall report in writing to the Engineer for rectification any error, inconsistency, or omission therein, which he shall discover, or any modification he considers necessary or desirable for the stability or economical construction of the building.

Doing Work in Freezing Weather.—Work shall not be done when the temperature where work is being done is below 28 degres Fahr., or if exposed to rains, except by special permission of the Engineer. Frozen materials shall not be built upon.

Engineer's Approval.—All materials or work specified to be of an "approved" type, construction, or finish, shall be submitted to and approved by the Engineer before being used or executed. Where materials, quality, or finish are not distinctly specified, samples shall be submitted to and approved by the Engineer before using same. An approval by the Engineer shall be understood to mean that it is conditional upon the work being in conformity with the contract requirements. No approval of deviation from contract requirements shall be implied, but shall be specifically mentioned in the Engineer's written approval. (See Section IV, Schedule of Conditions of Contract.)

Materials and Workmanship.—All materials shall be new, and all materials and workmanship shall be the best of the respective kinds contemplated by the contract, unless otherwise specified.

Contemplated Work.—The work to be executed under the contract consists in general of a ....., constructed and completely finished in every particular ready for furnishing, within the limits shown on the Drawings and described in the Specifications, except (a) elevators, (b) lighting fixtures, (c) electrical, (d) heating work, (e) or work specifically excepted or made subject for separate bids.

Contract Documents.—(See Agreement, Article I.)

Definitions.—The following definitions of works, terms, etc., shall be understood to govern their use throughout the Contract:

Approved.—The word "approved," as applied to any material, manner or mode of construction, shall be construed as though followed by the words "by the Engineer."

Best.—The term "best," or "best quality," shall be taken to mean that there is no better quality or finish of material of the grade specified or reasonably implied, obtainable on the market supplying the vicinity, or that there is no better class of work mentioned, reasonably obtainable.

Net Cost.—(See Conditions of Contract, Section XXVII.)

Provide, Etc.—For the sake of brevity, and to avoid needless repetition, the imperative mood has been largely used throughout the specification. Wherever it is used it shall be understood to mean, "The Contractor shall furnish all material and perform all labor necessary to ....." and these words shall be read into the sentence.

Provisional Amount.—(See Conditions of Contract, Section XXVIII.)

Drawings.—The Contractor shall furnish to the Engineer at proper times all shop and setting drawings or diagrams which the Engineer shall deem necessary to carry out the work. Each drawing or diagram shall give all the information required by the nature of work which it is intended to govern. These drawings or diagrams shall conform strictly to the Engineer's drawings and specifications, and where possible upon measurements taken from existing work. No deviation from the Engineer's drawings and specifications shall be made unless by special written order. The Engineer will inspect such drawings, but his purpose being to aid the Contractor and expedite the work, he shall not be held responsible for the Contractor's errors, the result of which, should they occur, must be made good at the Contractor's expense. The Contractor shall make required changes in such drawings or diagrams and supply the Engineer with one correct copy. Any methods or templates submitted shall be changed as reasonably required until satisfactory.

Fires, Smoking, Etc.—The Contractor shall not permit open fires to be lighted at any time in or dangerously near the building, and, after the roof is on, shall prohibit smoking within the building.

Imperfect Construction.—The Contractor shall notify the Engineer in writing if at any time he finds that any work or material that has or is being furnished by another Contractor in connection with his work is imperfect; and in case of his failure to give such notice, the Contractor shall be held to have accepted such work or materials, and all other existing conditions, and shall be responsible for any defects in his own work consequent thereon, or any change to his work made necessary by the future correcting of such defective work by other Contractors, and shall not be relieved of the obligation of any warranty because of any such condition or imperfection.

Imperfect Design.—The Contractor shall notify the Engineer in writing if he thinks any part of the work as designed or constructed is unsafe or likely to become so, or unsuited to produce the intended results, and shall thereafter proceed with such work only on the order from the Engineer.

Lines and Levels.—The Contractor shall establish all lines and levels necessary to the proper locating, laying out, and erecting of the work, in accordance with the Owner's survey and Engineer's drawings, and shall be responsible for their accuracy and maintenance. (See Schedule of Conditions of Contract, Section V.)

After the foundations have been completed and before the first tier of beams is set, the Contractor shall file with the Engineer a certificate from an approved surveyor showing that the building is located correctly according to the Owner's survey, and that the foundations, column bases, etc., are correct according to the drawings.

Measuring Work in Place.—The Contractor shall measure work already in place to insure the proper execution of subsequent work, or to assist the Engineer in making his drawings, and should any discrepancy between the executed work and the drawings be discovered, he shall report at once such discrepancy to the Engineer.

Notifying Engineer.—The Contractor shall bring to the attention of the Engineer any conditions pertaining to the site, the soil, the various portions of the work, whether executed by himself or by other Contractors, or to proposed work, or to laws and ordinances governing the work that should be known by the Engineer.

Overloading Structure.—The Contractor shall not permit any part of the structure to be loaded during construction with a weight greater than it is calculated to bear.

Reports to Engineer.—The Contractor shall furnish reports to the Engineer showing the status of the work at the building and in the shops, whenever so required, and in the manner directed.

Signs.—The Contractor shall not permit signs upon the building or premises, other than that of the General Contractor, except by the written permission of the Engineer.

Storage Limits.—The Contractor shall confine the storage of materials and the operations of his workmen to the reasonable limits indicated by the Owner or Engineer, and shall not necessarily encumber the premises with his materials.

A Suggestive Letter to Municipal Officials.

A complaint made generally by contractors for many years, has been that city officials begin work so late on the necessary formalities of a legal nature in connection with public improvements that construction work is commenced too late in the year. This frequently throws the completion into the fall when uncertain weather and scracity of labor increases costs.

It is believed that costs can be reduced and better work done if the legal proceedings are commenced early in the fall or winter. In the hope of bettering conditions the Illinois Association of Municipal Contractors has sent a letter to the Boards of Local Improvements throughout Illinois.

Owing to the many advantages to be derived from an early award of contracts for municipal improvements and in view of the time necessary to follow the legally prescribed course of proceedings and secure confirmation of the same, we suggest an early start on proceedings for all contemplated improvements for the year 1910.

Reports from many sections of the State indicate that the coming season will be a very busy one and we are prepared for a vigorous campaign—to improve the Quality, Quantity and Efficiency of Public Improvements.

We realize that in order to accomplish this, it will be necessary to secure a high degree of accuracy in the legally prescribed procedure and proceedings, to eliminate from specifications conditions which are onerous to the contractor and wasteful to the public, to have estimates made sufficient to enable the contractor to employ the materials and construct the work, as prescribed by your plans and specifications, at a fair profit, thus stimulating the market and demand for your bonds and protecting the contractor against unwarranted extractions and unreasonable discounts.

We are ready and willing to aid you in accomplishing the above, also to secure the faithful execution of contracts in substantial compliance with the plans and specifications thereof.

If at any time you are in doubt as to whether the contractor is executing the work properly, write this Association and we will investigate immediately.

Let is be understood that this Association bears all expenses incident to such investigation, such as attorney's fee, inspectors salaries, etc., and in no case will your officials or property owners be solicited for money to pay the expense.

Yours very truly,

Illinois Association of Municipal Contractors,

WILLIAM HOWE, Exec. Sec'ty.

Railway Section

Note: This section is devoted to methods and costs of constructing railways. It will cover road-bed and track construction, contractor's plant and organization, surveying methods and permanent way structures.

Original Cost and Cost of Reproduction of the Northern Pacific Railway (1,645 Miles) in the State of Washington.

In ENGINEERING-CONTRACTING, Dec. 8, 1909, was given the cost of the Great Northern railway (768 miles) in the state of Washington, as determined by Mr. Halbert P. Gillette for the Railroad Commission of that state. This issue contains similar data relating to the Northern Pacific railway, data that were submitted as exhibits by Mr. Gillette in his testimony at the hearings before the Railroad Commission, but not printed in the "findings," which contain only the conclusions as to costs reached by the commission after hearing all the evidence.

Work was begun on the Northern Pacific in Washington in 1879, and the major part of the construction of the main line was done in the early 80's. The task of ascertaining the original cost of the Northern Pacific was complicated not only by the age of the records but by the purchase of a number of important branch lines. The purchase prices were available, but it was exceedingly desirable to arrive at the actual cost to the builders of those branches. This was determined with considerable accuracy by securing construction quantities from old engineering records and applying prices current at the time of construction. The total original cost of main line and branches in Washington was found to be about $64,000,000, including improvements and betterments. Of this total, 80 per cent was ascertained with great accuracy from the accounting records. Of the remaining 20 per cent fully half was determined with almost as great accuracy from old engineering records, leaving only about 10 per cent to be estimated by field inspection. It has been repeatedly stated that the original cost plus improvements can be ascertained for very few railways in America.

Doubtless this assertion has deterred other railway commissions from even attempting to secure the original cost. The facts are, however, that of the entire railway values in Washington, not much more than 5 per cent were such that the original cost plus improvements could not be found. Mere age of construction has less to do with the difficulty of arriving at original costs than is commonly supposed. The greatest difficulty exists where purchases of lines have been made without transfer of the construction ledgers from the original owners to the purchasers. In many instances such transfers of ledgers are made, and in nearly all cases transfers of cross section books and other engineering records are made. The importance of securing the original itemized costs plus itemized costs of improvements can not be overestimated. The conflicting testimony of experts in court is the bane of a judge's life, but with actual original costs as a basis there is not great difficulty in determining costs of reproduction, for wages and prices are a matter of record and the increase or decrease in the value of any item of railroad construction is readily ascertained.

The following is a summary of the mileage of the Northern Pacific railway in Washington up to June 30, 1906:

	Miles.
Main line	658.73
Branch lines (Incl. Wash. & Col. River)	986.53
Total lines	1,645.26
Second track, main line	41.65
Spurs	117.59
Yard tracks and sidings	400.75
Total track	2,205.25

In the findings of the Railroad Commission the following mileage was assigned to the Northern Pacific:

	Miles.
Main line	687.68
Branches and spurs	941.74
Total lines	1,629.42

However, we shall use the mileage determined by Mr. Gillette—namely: 1,645 miles of line—since the following costs are based upon that mileage.

The original cost of the Northern Pacific in Washington plus improvements and betterments up to June 30, 1906, as determined by Mr. Gillette, was as given in Table I. In using the last column of this table it should be remembered that there were 1.34 miles of all tracks to each "mile of line"; hence to arrive at the cost per mile of track, divide the items in the last column by 1.34.

TABLE I.—ORIGINAL COST OF THE NORTHERN PACIFIC RAILWAY IN WASHINGTON, PLUS IMPROVEMENTS.
(1,645 miles of line.)

	Total.	Per mile of line.
1. Engineering	$ 2,907,344.26	$1,768
2. Right of way	1,796,272.60	1,092
3. Real estate	1,360,895.38	827
4. Clearing and grubbing	1,213,770.19	738
5. Grading	15,589,712.88	9,479
6. Tunnels	974,519.99	590
7. Bridges, trestles and culverts	7,879,328.94	4,790
8. Masonry	156,823.46	95
9. Ties	2,278,007.25	1,385
10. Rails	8,520,625.03	5,182
11. Track fastenings	1,063,620.96	647
12. Frogs and switches	255,243.07	155
13. Track laying and surfacing	1,669,691.18	1,015
14. Ballast	1,524,759.29	929
15. Station buildings and fixtures	1,477,207.49	897
16. Engine houses and turntables	246,663.97	150
17. Engine and car shops	849,340.77	516
18. Shop machinery and tools	294,507.95	179
19. Water stations	325,042.66	198
20. Fuel stations	79,544.48	47
21. Fencing right of way	273,067.50	166
22. Snow fences, etc	130,494.72	79
23. Stock yards	31,064.11	19
24. Crossings, cattle guards and signs	101,860.54	62
25. Interlocking and signal apparatus	44,706.61	27
26. Docks, wharves and coal bunkers	1,015,566.29	617
27. Transfer boats and barges	31,662.70	19
28. Section and tool houses	122,352.50	74
29. Miscellaneous structures	1,179,108.09	717
30. Telegraph lines	207,361.48	126
31. Transportation charges and rent of equipment	1,756,796.39	1,068
32. Operating expenses	261,910.26	159
33. Construction equipment	63,743.75	39
34. General expense	640,744.02	390
35. Interest and discount	7,173,190.53	4,360
36. Legal expense	3,009.24	2
37. Undistributed expense	480,212.62	292
Total	$63,979,772.61	$38,895
38. Equipment (rolling stock)	11,478,121.38	6,978
Grand total	$75,457,893.99	$45,873

Of this $63,979,772 cost of construction, $5,896,735 was spent for "improvements and betterments" between the years 1896 and 1906. The corresponding improvement expenditures prior to that time (charged to "Construction B") were $2,951,972, making a total of $8,848,707 spent for improvements.

It will be noted that Item 1, Engineering, amounts to nearly 5 per cent of the total cost exclusive of equipment. This very high percentage was due to several factors. The explorations for a pass through the Cascade Mountains were made at an early date when little was definitely known about their topography and that exploration alone cost $300,000. The engineering on the early branch lines cost 6 per cent of the $11,400,000 spent in building them, due in part to slow progress of work in those early days. A very considerable part of the early Northern Pacific work was done by company labor, which added not only to the expenditures for engineering and supervision, but also made the entire cost of the work greater than it would have been had it been done by contract.

Items 2 and 3 are small, because nearly all the right of way was given by the government. But as a matter of fact it should be a trifle higher than given in Table I, to provide for the unascertainable original cost of right of way of about 350 miles of branch lines.

Item 31, Transportation Charges and Rent of Equipment, relates to the book charges for hauling construction materials over the N. P. lines. Under a proper system of accounting this item would have been distributed to the materials themselves.

Item 32, Operating Expense, relates to the cost of operating freight and passenger trains over the lines before they were formally transferred to the operating department.

Item 34, General Expense, was practically 1 per cent of the total construction cost.

On the early construction work, involving some $30,000,000, this item of general expense was nearly 1¾ per cent.

Item 35, Interest and Discount, is inordinately high. It consists mostly of discount on the bonds. In fact the first $22,400,000 expended, more than $5,900,000 was charged to interest and discount, or nearly 27 per cent of the total. Hence no general conclusions can be drawn from this item.

Item 36, Legal Expense, does not appear in any of the accounts except for a small branch line, where it amounted to nearly 1 per cent of the cost of that branch.

Item 37, Undistributed Expense, relates to certain items which were so entered that they could not be prorated to Washington under any definite item, and were consequently grouped here.

The cost of reproducing (new) the Northern Pacific railway in Washington, as estimated by Mr. Gillette, is given in Table II, the values of right of way and land being those finally determined by the Railroad Commission.

TABLE II.—COST OF REPRODUCING THE NORTHERN PACIFIC RAILWAY IN WASHINGTON, AS ESTIMATED BY H. P. GILLETTE.
(1,645 miles of line.)

1. Engineering, 5% of Items 3 to 37	$ 2,510,580.23
2. Right of Way, etc.:	
Terminal land, Seattle	13,038,176.50
Terminal land, Tacoma	7,638,006.00
Terminal land, Spokane	5,306,465.00
Terminal land, Everett	366,530.00
Terminal land, Bellingham	215,330.00
Right of way and other station grounds	6,298,364.50
Total Right of Way, etc.	$32,862,872.00
3. Clearing and Grubbing:	
Clearing, 9,445 acres at $100.00	$ 944,500.00
Grubbing, 16,542 stations at $22.00	330,840.00
Extra trees cut, 4,942 at $2.00	9,964.00
Six branch lines (from acctg. records)	117,811.04
Improvements (from acctg. records)	24,069.48
Total Clearing and Grubbing	$ 1,427,184.52
4. Grading:	
Earth excavation, 18,566,958 cu. yds. at $0.22	$ 4,084,730.76
Earth embank. (barrow), 3,265,120 cu. yds. at $0.22	718,326.20
Unclassified, 318,512 cu. yds. at $0.50	159,256.00
Cement gravel, 3,483,838 cu. yds. at $0.40	1,393,535.20
Loose rock, 1,321,720 cu. yds. at $0.50	660,860.00
Solid rock, 1,735,503 cu. yds. at $1.10	1,909,053.30
Overhaul, 13,767,359 cu. yds. 100 ft. at $0.01	137,673.59
Rip-rap, 186,064 cu. yds. at $1.10	204,670.40
Slope wall, 3,350 cu. yds. at $2.50	8,375.00
Log cribs, 882,632 lin. ft. logs at $0.16	141,221.12
Timber cribs, 127,774 ft. B. M. at $26.00	3,322.12
Six branch lines (cost from acctg. records)	1,113,697.75
S. L. S. & E. (estimated from field inspection)	88,000.00
Improvements and betterments (from acctg. records)	1,988,673.81
Total Grading	$12,543,395.25
5. Tunnels:	
Stampede, 9,844 lin. ft. (masonry lined), at $180.00	$ 1,771,920.00
Seattle, one-half interest, 5,141 (dbl. track in earth), at ½ of $360.00	925,380.00
Other tunnels lined with concrete, 2,570 ft. at $110.00	282,700.00
Other tunnels lined with timber, 2,329 ft. at $70.00	163,030.00
Total Tunnels	$ 3,143,030.00

6. Bridges, Trestles and Culverts: Howe Trusses and Combination.	
30-ft. spans, 1 at $1,200.00	$ 1,200 00
50-ft. spans, 4 at $1,600.00	6,400.00
60-ft. spans, 8 at $1,800.00	14,400.00
70-ft. spans, 1 at $2,000.00	2,000.00
80-ft. spans, 3 at $2,300.00	6,900.00
90-ft. spans, 1 at $3,000.00	3,000.00
100-ft. spans, 15 at $4,000.00	60,000.00
110-ft. spans, 1 at $4,500.00	4,500.00
120-ft. spans, 3 at $5,500.00	16,500.00
130-ft. spans, 1 at $6,200.00	6,200.00
140-ft. spans, 5 at $7,000.00	35,000.00
150-ft. spans, 19 at $7,500.00	142,500.00
13 miscel. spans (2,390 lin. ft. at $60.00)	143,400.00
8 draw spans, 1,625 lin. ft. at $60.00	97,500.00
Total Howe Trusses and Comb. Spans	$ 539,500.00
Pile and frame trestles (44,130 M at $30,000, and 1,304,533 lin. ft. piles at 0.25; av. height trestle 19 ft.), 168,978 lin. ft. at $10.50	1,774,269.00
Trestles filled with earth (139,862 lin. ft.), 5,988,784 cu. yds. at $0.20	1,197,756.80
Steel Bridges:	
Spokane River at Trent	$ 40,000.00
Snake River, Ainsworth	1,100,000.00
Columbia River, Kennewick	500,000.00
Tacoma Channel	105,000.00
Chehalis River	100,000.00
Walla Walla River, W. & C. R.	43,190.00
Three plate girders (260 ft.) and concrete ret. wall (350 ft.), N. & C. R.	30,200.00
Steel in other bridges, 19,516,343 lbs. at 0.0175	327,026.44
Masonry abutments and piers for 215 spans	537,500.00
Total Steel Bridges	$ 3,382,916.44
Culverts:	
Log culverts, 264,943 lin. ft. logs at $0.16	$ 42,390.88
Timber culverts, 5,015,024 ft. B. M. at $26.00	130,390.62
Box drains, 336,720 ft. B. M. at $26.00	8,754.72
Total log and timber culverts	$ 181,536.25
Concrete arch, 11,510 cu. yds. at $9.00	103,590.00
Stone drains, 6,731 cu. yds. at $8.00	53,848.00
Total masonry culverts	$ 157,438.00
Vitrified Pipe:	
4-in., 62 lin. ft. at $0.25	$ 15.50
10-in., 50 lin. ft. at 0.45	22.50
12-in., 1,229 lin. ft. at 0.50	614.50
15-in., 226 lin. ft. at 0.75	169.50
16-in., 137 lin. ft. at 0.80	109.60
18-in., 3,929 lin. ft. at 1.30	5,107.70
20-in., 168 lin. ft. at 1.70	285.60
22-in., 109 lin. ft. at 2.00	218.00
24-in., 24,895 lin. ft. at 2.60	664,727.00
30-in., 2,845 lin. ft. at 3.50	9,957.50
36-in., 276 lin. ft. at 4.50	1,242.00
Total Vitrified Pipe Culverts	$ 682,469.40
Cast Iron Pipe:	
6-in., 300 lin. ft. at $1.00	$ 300.00
8-in., 24 lin. ft. at 1.50	36.00
12-in., 892 lin. ft. at 3.00	2,676.00
14-in., 27 lin. ft. at 3.50	94.50
16-in., 732 lin. ft. at 3.75	2,745.00
18-in., 5,095 lin. ft. at 4.00	20,380.00
20-in., 889 lin. ft. at 4.75	4,222.75
24-in., 28,411 lin. ft. at 6.00	170,466.00
30-in., 2,432 lin. ft. at 7.00	17,024.00
36-in., 4,453 lin. ft. at 9.00	40,122.00
42-in., 663 lin. ft. at 13.00	8,619.00
48-in., 1,026 lin. ft. at 18.00	18,468.00
54-in., 516 lin. ft. at 21.00	10,836.00
60-in., 198 lin. ft. at 25.00	.....
36-in. corrugated iron, 900 ft. at $3.00	4,950.00
Total Iron Pipe Culverts	2,700.00
Masonry walls, etc	303,639.25
Total Bridges, Trestles and Culverts	$ 7,776,348.11
7. Ties.	
(2,205.24 miles at $3,000), 6,615,750 at $0.50	$ 3,307,875.00
8. Rails:	
221,367 tons at $40.00	$ 8,854,680.00
9. Track Fastenings:	
Spikes (6,500 lbs. per. mi.), 14,334,125 lbs. at $0.028	$ 401,355.50
Angle Bars (17,600 lbs. per mi.), 38,812,400 lbs. at $0.025	970,310.00
Bolts (1,800 lbs. per mi.), 3,969,450 lbs. at $0.032	127,022.00
Rail braces, 838,950 at $0.10	83,895.00
Tie plates, 1,525,000 at $0.08	122,000.00
Total track fastenings	$ 1,704,582.90
10. Frogs and Switches:	
Switches, 2,850 at $80.00	$ 228,000.00
11. Ballast.	
1,645 miles at $1,000.00	$ 1,645,000.00
560 miles at $600.00	336,000.00
Total ballast	$ 1,981,000.00
12. Track Laying and Surfacing:	
2,205.25 miles at $700.00	$ 1,543,675.00
13. Fencing Right of Way:	
From acctg. records plus 20%	$ 227,682.00
14. Snow Fences and Sheds:	
From acctg. records plus 20%	$ 156,595.00
15. Crossings, Cattle Guards and Signs:	
From acctg. records plus 20%	$ 122,232.00
16. Telegraph Lines:	
From acctg. records plus 20%	$ 248,835.00
17. Station Buildings and Fixtures:	
Seattle terminal station (½ interest)	$ 280,000.00
110 combination depots (frame), 167,062 sq. ft. at $1.50	250,593.00
100 passenger depots (frame), 121,684 sq. ft. at $1.25	$ 152,105.00
Spokane passenger depot (brick), 8,050 sq ft. at $4.00	32,200.00
31 freight depots (frame), 591,050 sq. ft. at $1.00	591,050.00
3 freight depots (brick), 81,320 sq. ft. at $1.50	121,980.00
Warehouses (frame), 376,741 sq. ft. at $1.40	527,437.40
720 wood platforms, 1,006,790 sq. ft. at $0.10	100,679.00
15 cinder platforms, 26,492 sq. ft. at $0.06	1,589.52
2 cement platforms, 34,631 sq. ft. at $0.15	5,194.65
198 water closets, 10,666 sq. ft. at $1.00	10,666.00
Track scales, 28 at $1,300.00	36,400.00
Total station buildings	$ 2,109,894.57
18. Engines Houses and Turntables:	
8 engine houses (frame), 27,686 sq. ft. at $0.75	$ 20,764.50
Engine houses (frame), 20 stalls $900.00	18,000.00
Engine houses (brick), 71 stalls at $1,500.00	106,500.00
Turntables, 28 at $2,800.00	78,400.00
6 ash pits, 277 lin. ft. at $15.00	4,155.00
Total engine houses and turntables	$ 227,819.50
19. Engine and Car Shops:	
43 machine shops and car houses (frame), 114,523 sq. ft. at $0.50	$ 57,261.50
39 machine shops and car houses (brick), 299,685 sq. ft. at $2.90	869,086.50
Transfer tables, 2 at $1,500.00	3,000.00
83 sand, coal, wood, oil and store houses, 20,245 sq. ft. at $0.50	10,122.50
3 bins, 2,053 sq. ft. at $0.25	513.25
Total engine and car shops	$ 939,983.75
20. Shop Machinery:	
From acctg. records plus 20%	$ 353,408.00
21. Water Stations:	
91 tanks, 41 pump houses, etc. (from acctg. records plus 20%)	$ 390,050.00
22. Fuel Stations:	
From acctg. records plus 20%	$ 95,453.00
23. Stock Yards:	
63 yards, 603,397 sq. ft. at $0.05	$ 30,169.85
24. Interlocking and Signal Apparatus:	
From acctg. records plus 20%	$ 53,648.00
25. Docks, Wharves and Coal Bunkers:	
From acctg. records plus 20%	$ 1,216,680.00
26. Section and Tool Houses:	
124 section houses, 89,866 sq. ft. at $1.25	$ 112,332.50
86 bunk houses, 29,430 sq. ft. at $0.70	20,601.00
147 tool houses, 27,839 sq. ft. at $0.50	13,919.50
Total section and tool houses	$ 146,853.00
27. Miscellaneous Structures:	
From acctg. records plus 20%	$ 1,382,530.00
28. Legal and General Expense:	
1% of items 3 to 27 inclusive	$ 502,116.04
29. Interest During Construction:	
5% of items 1 to 28 (except item 2)	$ 2,661,215.04
30. Stores on Hand	530,677.00
Total of items 1 to 30 inclusive	$89,279,064.76
31. Equipment:	
Locomotives	$ 4,242,950.51
Passenger	1,447,593.23
Freight	8,040,254.92
Work and miscellaneous	603,578.55
Total equipment	$14,334,377.21
Grand total of items 1 to 31 incl.	$103,613,441.97

It will be noted that Item 1, Engineering, was estimated at 5 per cent, instead of the 3½ per cent which was used for the Great Northern. Since engineering had actually cost the Northern Pacific 5 per cent, Mr. Gillette considered it fair to allow that amount, particularly in view of the fact that there was a large mileage of cheap branch lines where the item of engineering would form a larger percentage than on main line construction. The Railroad Commission, however, adopted a uniform 3½ per cent for all the railways in the state as a fair allowance for engineering.

Item 2, Land, does not include any land not actually used or needed for railway purposes in the immediate future. The Northern Pacific railway has a right of way 400 ft. wide on much of its line, given to it by the government. The Railroad Commission allowed a 100 ft. strip as being all that is actually needed for railway purposes, except in towns and cities. In addition to the lands owned and used for terminals, there was land of the following value, which was included in Item 2 because it is not needed for railway purposes at present.

Spokane	$ 1,194,156
Tacoma	4,980,417
Seattle	9,250,000
Total	$15,424,573

The value of the right of way land not needed for railway purposes was determined to be $913,184, and is not included in Item 2. Item 4, Grading, is equivalent to the following yardage per mile of line:

	Cu. Yds. Per Mile.
Earth excavation	11,325
Earth embank. (borrow)	1,990
Unclassified	195
Cement gravel	2,125
Loose rock	805
Solid rock	1,055
Total	17,495
6 branch lines (unclassified)	1,700
S. L. S. & E. (unclassified)	130
Improvements (unclassified)	4,545
Trestles filled (item 6)	3,650
Grand total	26,520

The items of yardage in the "6 branch lines" and of yardage in "improvements" are estimated by assuming that the unclassified yardage on these branch lines cost 40 cts. per cu. yd. and that the yardage in improvements cost 30 cts. per cu. yd. Since most of the improvement yardage was bank widening, the lower unit price for this unclassified work is justified. By referring to our issue of Dec. 8 it will be seen that the yardage per mile on the Great Northern was 28,570 cu. yds. per mile. (An error will be found in our issue of Dec. 8; the yardage of filling trestles should be 2,700 instead of 270 per mile.)

Table III gives a summary of Mr. Gillette's estimate of the cost of reproduction (new) and the present value (second hand) of the Northern Pacific in Washington. The annual rates of depreciation of the different classes of structures and of equipment were the same as those used in calculating the present value of the Great Northern, for which see ENGINEERING-CONTRACTING, Dec. 8.

TABLE III.—COST OF REPRODUCTION AND PRESENT VALUE OF THE NORTHERN PACIFIC RY. IN WASHINGTON (1.645 MILES).

	Cost of Reproduction New.	Condition Per Cent.	Present Value.
1. Engineering	$ 2,510,580	100.0	$ 2,510,580
2. Right of way, etc.	32,862,872	100.0	32,862,872
3. Clearing and grubbing	1,427,185	100.0	1,427,185
4. Grading	12,543,395	110.0	13,797,735
5. Tunnels	3,143,030	100.0	3,143,030
6. Bridges, trestles and culverts	7,776,348	84.7	6,586,567
7. Ties	3,307,875	50.0	1,653,938
8. Rails	8,854,680	80.0	7,083,744
9. Track fastenings	1,704,583	80.0	1,363,666
10. Frogs and switches	228,000	80.0	182,400
11. Ballast	1,981,000	100.0	1,981,000
12. Track laying and surfacing	1,543,675	100.0	1,543,675
13. Fencing right of way	227,682	55.0	125,225
14. Snow fences and sheds	156,595	72.0	112,748
15. Crossings, cattle guards and signs	122,232	55.0	67,228
16. Telegraph lines	248,835	75.0	186,626
17. Station buildings and fixtures	2,109,895	81.5	1,727,769
18. Engine houses and turnt'bles	227,819	68.2	155,373
19. Engine and car shops	939,984	66.4	624,169
20. Shop machinery	353,408	65.0	299,715
21. Water stations.	390,050	65.5	255,483
22. Fuel stations.	95,453	77.5	73,976
23. Stock yards	30,170	45.5	13,727
24. Interlocking and signal apparatus	53,648	85.0	45,601
25. Docks, wharves and coal bunkers	1,216,680	75.0	912,510
26. Section and tool houses	146,853	61.0	89,580
27. Miscellaneous structures	1,382,530	61.0	843,343
28. Legal and general expense	502,116	100.0	502,116
29. Interest during construction	2,661,215	100	2,661,215
30. Stores on hand	530,677	100.0	530,677
Total of items 1 to 30	$ 89,279,065	.....	$83,363,454
31. Equipment	14,334,377	67.5†	9,677,947
Grand total	$103,613,442	.....	$93,041,401

TABLE IV.—COST OF REPRODUCTION OF THE NORTHERN PACIFIC IN WASHINGTON.

	Per mile of line.*
1. Engineering	$ 1,526
2. Right of way, etc.	19,980

*There are 1.34 miles of track per mile of line.

3. Clearing and grubbing	867
4. Grading	7,626
5. Tunnels	1,911
6. Bridges, trestles and culverts	4,728
7. Ties	2,011
8. Rails	5,384
9. Track fastenings	1,036
10. Frogs and switches	139
11. Ballast	1,206
12. Track laying and surfacing	938
13. Fencing right of way	138
14. Snow fences and sheds	95
15. Crossings, cattle guards and signs	74
16. Telegraph lines	151
17. Station buildings and fixtures	1,283
18. Engine houses and turntables	138
19. Engine and car shops	571
20. Shop machinery	215
21. Water stations	237
22. Fuel stations	58
23. Stock yards	18
24. Interlocking and signal apparatus	33
25. Docks, wharves and coal bunkers	740
26. Section and tool houses	89
27. Miscellaneous structures	840
28. Legal and general expense	305
29. Interest during construction	1,618
30. Stores on hand	322
Total of Items 1 to 30	$54,277
31. Equipment	8,715
Grand total	$62,992

The actual cost of the equipment on the entire Northern Pacific system, up to June 30, 1906, was as follows:

Locomotives	$12,977,823.23
Passenger	5,074,739.99
Freight	21,436,740.43
Work and miscel	1,904,185.11
Trust equipment	3,032,526.48
Discount and commission	939,858.42
Total equipment	$45,365,882.66

The mileage of the Northern Pacific system and its chief engineer's estimate of cost of reproduction of the equipment, as well as of other items, was published in ENGINEERING-CONTRACTING, April 15, 1908.

The above does not include the equipment of the Washington and Columbia River railway, which was estimated by Mr. Gillette to have cost as follows:

Locomotives	$ 60,000
Passenger	24,000
Freight	62,000
Work	1,200
Total	$147,200

The cost of the locomotives in Washington was based upon the cost of those actually used in that state. The cost of passenger and freight cars was apportioned to Washington according to car mileage. The cost of work equipment was apportioned according to mileage of railway line operated. On this basis the following costs were arrived at for the state of Washington:

	Original cost.	Cost reprod.	Present value.
Locomotives	$ 3,689,522	$ 4,242,950	$2,715,488
Passenger	1,598,184	1,447,593	868,556
Freight	5,665,564	8,040,255	5,668,380
Work and miscellaneous	524,851	603,579	425,523
Total	$11,478,121	$14,334,377	$9,677,947

The "cost of reproduction" was determined by adding 15 per cent to the original cost to provide for increased prices. The "present value" was determined by deducting from the "cost of reproduction" a depreciation of 3.6 per cent per annum.

In this connection it is interesting to note that the report of the Northern Pacific railway to the Interstate Commerce Commission for the fiscal year ending June 30, 1906, gave the value of the equipment at $32,044,260, or about 70 per cent of its original cost. Mr. Gillette's estimate of the "present" value was 67.5 per cent of the original cost, which shows that the Northern Pacific railway had charged off for depreciation only slightly less than Mr. Gillette has estimated.

It is also worthy of comment that many railway engineers have erred in their estimates of the cost of equipping railways, largely because they have taken the total cost of equipment given in the Interstate Commerce Reports and have divided it by the total mileage of railway lines. It has not been generally known that the costs given in the Interstate Commerce Commission reports are depreciated, or second hand, values. Some years ago Mr. John F. Wallace (see Gillette's "Handbook of Cost Data," p. 548) estimated that the average mile of "trunk line" would cost $40,000, of which $4,000 was for equipment. It will be noted that the equipment of the Northern Pacific in Washington averages $8,715 per mile of both trunk (or main) line and branches.

In roughly estimating the probable cost of equipment of a steam railway line the proper method is obviously to base the estimate upon the ton-miles (or car-miles) of freight per year per mile of line. In ENGINEERING-CONTRACTING, June 19, 1907, the freight carried per mile of railway in America was shown to have been 830,000 ton-miles in 1904. Since the Northern Pacific carried 845,000 ton-miles in 1906 per mile of line in Washington, it may be regarded as nearly typical of the average American road, so far as freight is concerned. On the other hand, its passenger traffic is considerably less dense than that of the average American road. It is safe to say, therefore, that the cost of the equipment of the Northern Pacific is fairly typical of the average railway in America. Roughly speaking, then, the cost of equipment of an American railway is $10 per 1,000 ton-miles carried per annum per mile of line.

For a discussion of the life of the Northern Pacific equipment and cost of repairs, see ENGINEERING-CONTRACTING, Sept. 2, 1908.

During the fiscal year ending June 30, 1906, there were 1,390,064,467 ton-miles of freight carried over the Northern Pacific within the state of Washington, or 845,000 ton-miles per mile of line. This was almost 50 per cent more per mile of line than was carried by the Great Northern, which accounts for the higher cost of the Northern Pacific equipment per mile of line.

In drawing conclusions relative to the probable average cost of railway lines throughout the country, serious errors have been made by considering only the costs in one or two states. It will be noted that the cost of terminal lands in Washington is enormous when charged entirely to the road mileage within that state. In the findings of the Washington Railroad Commission it was determined that 56.8 per cent of the entire value of lands used by the whole Northern Pacific railway system exists in the state of Washington. (See ENGINEERING-CONTRACTING, April 15, 1908, for an itemized estimate of the cost of the entire Northern Pacific railway system.)

The Railroad Commission also determined that 62.3 per cent of the entire cost of tunnels and 31.6 per cent of the entire cost of bridges on the N. P. system is found in Washington.

These figures show clearly the rugged character of much of the country traversed by the N. P. in Washington. Unquestionably the cost of its lines in that state far exceeds the cost in any other state through which it passes. The same also is true of the Great Northern.

In a subsequent issue we shall give similar data relative to the cost of the 500 miles in Washington owned by the Oregon Railroad & Navigation Co., the cost of which is very much less per mile than the G. N. or N. P.

The Study of Engineering-Contracting in Engineering Colleges.*

BY W. R. HARRIS

Instruction in engineering-contracting is a very important matter in this age of keen and strenuous competition. Engineering has been defined by a prominent member of the profession as "The science of designing structures so as to resist the force to which they are subjected while performing their functions," and as "The art of so designing these structures that the interest upon their first cost plus annual depreciation plus annual operating expenses shall be the least sum possible of attainment."

Engineering-contracting may be defined as the art of constructing structures at a cost closely approximating the original estimates for same. In short, an engineer-contractor should know what one dollar, either in energy or materials, will accomplish.

The time is passing when one can wait to obtain knowledge of engineering-contracting solely by personal experience. We must study the experience and results of others and those who reap the benefit of the experience of others are indeed fortunate. The present method of obtaining an education in engineering-contracting is by actual work in field and office and by reading and studying books and papers dealing with methods and costs on engineering work as well as of designing.

The newly fledged graduate engineer is of small use to the contractor, for although he may be qualified to design structures, he is not always able to compute the quantities of labor and materials required in the proposed structure. He can very seldom suggest practical methods of operations, costs, etc., and hence, before he can attain to the position where he will be of much value to the contractor, he must pass through the school of experience.

It is possible to so arrange studies in engineering colleges that the graduate engineer will have some knowledge of engineering contracting such as to render his services of greater value to his employer.

The student in engineering-contracting can be instructed in methods and costs of construction. Such a course of instruction would make better engineers for they would then have made their start in the art of engineering as defined above.

An engineer or contractor is always judged by his experience, and if the student in college can gain some of this knowledge by instruction instead of experience he is saved just so many years of hard work.

A great many structures have incorporated in their design non-essential details which increase the cost of the structures beyond economic limits. This is caused by ignorance of construction methods and not by the desire to unnecessarily increase costs, hence a course in engineering-contracting will be of great assistance to an engineer as he would be able to omit non-essential details and to design his structure so that the minimum of energy would be expended in its construction. By non-essential details I do not mean the addition of lines that would beautify a structure where beauty is desirable.

An engineer instructed in simply the science of engineering, and one that the contractor usually refers to as a "theoretical engineer," would design a structure to resist certain forces and would probably not consider, due to lack of knowledge on the subject, that the contractor, to secure certain lines called for by the design, would expend more work than would be necessary by the modification of the design, which modification would not affect the ultimate strength. For example, I know of several instances in concrete design and construction work where by a slight modification in the angles and lines a better, cheaper, and more beautiful structure was obtained.

An engineer who is familiar with everything that enters into the design and construction of the proposed structure, whether it be a sewer, a building, a bridge, a piece of machinery, or what not, can produce better results than one who is simply trained in the pure theory of the science.

The question will naturally arise as to how such instruction can be imparted to the student, and I will attempt to suggest some ideas which I hope will be productive of discussion and bring out other, and better, ideas on the subject. I believe that any department of engineering, whether civil, mining, hydraulic, mechanical, electrical, etc., can be so handled as to provide instruction in engineering-contracting as applied to any particular branch of engineering.

When the student arrives at that part of the course of study embracing designing, he should be required to make up a schedule of quantities showing a bill of materials with market prices on same, and also to include in his schedule the estimate of labor required to construct, manufacture, or erect each item or group of items. He could give a statement of what, in his opinion, would be the proper crew and proper tools required in the construction of the work. He could also suggest a plan of operation for the construction crew.

Again, at the proper period of the course

*A paper read before the American Society Engineering Contractors, Jan. 12, 1910.

of instruction, plans and specifications of actual proposed work, preferably in the immediate vicinity of the college, could be secured and each student in engineering-contracting be required to make up a detailed estimate on the proposed work and to submit a bid on same. With his detailed estimate and his bid, he could present a detailed plan of operation, including the list of outfit, crew required, etc. He could also estimate the time required to complete the work or certain portions of it. Copies of the bona fide bids on which the contracts were awarded could then be secured and compared with the students' bids. Where the work was in the immediate neighborhood, students could be detailed to observe the operations, methods of working, obtain costs, etc., and report all of this back to the class.

Each student could spend a day or several days' time on this work, and another student take it up where the preceding student left off. The result of each day's operations could be reported the succeeding day in open class in a very few minutes. Such a course of procedure would not only develop the student's power of observation but would also place him in a position where he would be in actual touch with construction work.

All colleges have more or less construction work which they in most cases let by contract. Every student in the branch of engineering involved in each contract could make up a detailed estimate, bid, etc., as outlined above, and the same method of procedure adopted as to inspection, reports and discussion.

I do not believe that this is practised in many colleges, at least I have never seen such a method of procedure adopted on any work on which I have bid. I know from my own experience that the study of any piece of work is of value to any engineer or contractor.

The most important part of such a course of study would be the open discussion in class of each day's work, methods, etc., as through discussion new ideas will be brought forth.

In other learned professions such as medicine and law, practising lawyers, surgeons and physicians of repute are secured to lecture to students, which lectures are from a practical standpoint and are based on results achieved in actual practise. Certain processes, methods, etc., evolved by actual work are brought up and described. There are more books on law and medicine than have ever been written on engineering or contracting and, therefore, the classes in engineering-contracting are more in need of lectures.

I believe it would be easy to secure the services of practising engineers and contractors to lecture to classes in engineering colleges, and a few lectures from such men, engaged in actual work can be of inestimable value to every student in the class. Such lectures and discussions as would be produced by the system as outlined above would cause every student to consider plans and specifications from the view point of the constructor as well as from the view point of the designer.

The result of this could not help but eliminate unjust clauses in specifications, such clauses as would tend to increase costs without an adequate and necessary return in strength, beauty and utility.

The ethics of engineering-contracting should be taught and discussed, as well as the ethics of engineering. Engineering students should be taught that contractors are "worthy of their hire," and that the contractor is entitled to a fair profit on honest work. He should be taught that it is fair to ask only for what is possible and to pay a price that is based upon actual cost plus a fair profit. He should be taught to specify good work and to require good work.

He should so draw plans and specifications that intelligent contractors could arrive at a clear idea of what is required as well as to conditions governing costs. He should be taught to conceal nothing regarding conditions that would affect the cost.

He should be taught to make specifications as brief and plain as is consistent with a clear explanation of what is required.

The student would learn to draw specifications that would be better than many now drawn, for by studying the specifications of public works, he would himself, when called upon to prepare detailed estimate of cost and bid on these specifications, realize the unfair features that many times enter into contracts, and having impressed upon his mind the effect on the cost by these unfair features his tendency would be to eliminate these features after entering into the business field.

I have recently had the pleasure of meeting an engineer whom every contractor termed a "crank." Every contractor, however, stated that he was absolutely honorable and absolutely just, although in many things not practical. I was told that the specifications would have to be fulfilled to the letter. This engineer, I do not believe, ever did any construction work himself, and hence there were certain impractical features in some of his work that increased the cost of his structures unnecessarily. In fact, I understand that he had spent many thousands of dollars, due to impractical ideas, but he always got what was specified and his work, though costly, was always good from an engineering standpoint.

This instance simply emphasizes the necessity of the engineer having a broad acquaintance with construction methods and costs, for I do not believe that engineer mentioned above had any idea that he was impractical in the slightest. I believe that he erred on the right side because every contractor who knew him figured absolutely on the specifications and took nothing for granted except what was specified. Therefore, every contractor figured on the same basis.

I also understand that the inspection on work under this engineer's charge is very rigid, but that the contractor is never called upon to do anything not specified in his contract.

It would be very much better if all engineers would consider a structure from both the standpoint of the constructor and the engineer, and then see that the specifications are obeyed strictly.

The engineering-contracting student should familiarize himself with tools and appliances used in work coming within his branch of engineering, and to this end every college should have a catalogue library, properly indexed. Each student should study the advertising columns in technical papers and should request such catalogues as interest him and place same in the catalogue library of the college, for many times new methods are suggested by new appliances.

The student should be taught to think of actual work, first, as so much human energy expended in periods of man-hours, whether this energy is utilized by men with the pick, shovel, or other hand tool, or by means of the steam shovel, crane, or other piece of machinery.

After the student learns that a gang of a certain number of men will accomplish with a certain tool so many units of work by the expenditure of so many units of energy, he will be able to approximate closely similar work in any part of the country no matter what the cost of labor, tools, and materials may be, provided he is acquainted with the local cost of same.

All the theory of design ever taught will not help the student to arrive at the man-hours required to excavate earth, rock, etc., nor will it show him the difference in man-hours required per unit of sand, clay, loam, gravel, loose rock, solid rock, in open cut, nor the difference in energy expended per unit in tunnel or in shaft.

This can only be guessed at by the ordinary engineering student, but it can be more nearly approximated by the same student after he has studied work near him and after he has, by actual observation, obtained some data along these lines. Such observation and study of the work near him will enable him to study with intelligence cost data compiled by engineers and contractors on work that may be done at a distance remote from the college.

I know that many contractors have been disappointed in the work rendered by graduates of engineering colleges, and I believe that graduates who have taken a course in engineering-contracting will be more gladly received by the constructors as well as by the engineering fraternity.

The above statement may be somewhat crude in its presentation, but this is such a broad subject that it cannot be properly handled by one man in one article, and I trust that what I have said above will be productive of discussion among our members and that it will bring forth ideas that will assist in staring the establishment of a course in engineering-contracting in some of our engineering colleges.

LETTERS TO THE EDITOR.

Using the Bag of Cement as a Unit of Measure.

Sirs: I note in a recent issue that you suggest that specifications for concrete work should call for a certain number of barrels or of sacks of cement to the yard instead of the more common practice of specifying the proportions, and I wish to advise that the same has been my practice for several years now.

In the annual city specifications for the city of Memphis, drawn by me for 1908 for concrete work in the city, I specified three classes of concrete, using, 1st, 1½ bbls. of Portland cement, ½ cu. yd. sand and 1 cu. yd. of crushed stone; 2d, using 1¼ bbls. of cement, ½ cu. yd. sand, and 1 cu. yd. of stone; and, 3d, using 1 bbl. cement, ½ cu. yd. of sand and 1 cu. yd. of stone. These classes are designated by me as first class, second class and third class concrete, the third class being that specified for foundation work and the first class that specified for curb and gutter.

These classes have been adhered to in all city work under my supervision since I have been in office. I certainly am glad to see you advocating the practice, and I trust you will further push your recommendations in the matter and endeavor to get the custom thoroughly rooted. I see no reason for the use of the more cumbersome method, except that it has been established by custom for a number of years, and the engineers seem to follow it as do sheep their leaders.

Yours very truly,
J. H. WEATHERFORD,
City Engineer.

Memphis, Tenn.
Jan. 7, 1910.

(Our correspondent seems to have missed our point. The barrel has disappeared practically as a unit and the bag has taken its place. We advocated the disuse of all specifications involving the barrel and the yard. Engineers specify mixtures by proportions of cement, sand and coarse aggregates and contractors mix batches as a rule with small quantities of the materials. Our suggestion was that after specifying the proportions the engineer should fix quantities by establishing a unit. This unit can very properly be the present commercial size bag accepted as being equivalent to one cubic foot. The contractor can then make his measuring boxes and his batches of any convenient size. With the barrel and yard as units a certain amount of calculating must always be done involving fractions.—EDITORS.)

Directions for Coloring Concrete.

Sirs:—I want to get some information on the subject of making concrete white or any other color for ornamental work.—Adam W. Griffith.

Tornado, W. Va.

(A number of cement manufacturers now make white Portland cement and by writing to cement manufacturers advertising in ENGINEERING-CONTRACTING you can no doubt secure some. The color of concrete is largely determined by the aggregates for the cement is only from 10 to 12 per cent of the mass. By using broken marble in place of ordinary

stone and marble screenings in place of sand an almost white concrete may be obtained. The mixing water should be filtered and free from iron. For green use 5 lbs. of ultramarine and for blue use 6 to 7 lbs. of ultramarine per bag of cement. One authority says 2 lbs. of Excelsior Carbon Black per bag of cement will make a good black. Some men use 10 to 11 lbs. of manganese dioxide per bag of cement for black. For brown use 6 lbs. of Roasted Iron Dioxide per bag of cement. For yellow use 6 lbs. of yellow ochre and for buff use double this amount per bag of cement. An ordinary red can be made with from 6 to 10 lbs. per bag of red iron oxide and a bright red with 6 lbs. per bag of Pompeiian red.—Editors.)

Technical Society Meetings.

The list following names those technical societies in which engineers and contractors are most interested, whose meetings are to be held within three months of the date of this issue. There are given for each society listed the date and place of meeting and the name and address of the secretary, to whom all communications and inquiries should be addressed.

American Society of Civil Engineers.
Jan. 19-20, 1910. Annual meeting at New York City. Secy., Chas. Warren Hunt, 220 W. 57th St., New York, N. Y.

Canadian Society of Civil Engineers.
Jan. 25-27, 1910. Annual meeting at Ottawa, Ont. Secy., C. H. McLeod, 413 Dorchester St., West, Montreal, Que.

American Society of Engineering Contractors.
Feb. 24-26, 1910. Annual convention at Chicago, Ill. Secy., Daniel J. Hauer, Park Row Building, New York, N. Y.

American Society of Heating and Ventilating Engineers.
Jan. 18-20, 1910. Annual meeting at New York City. Secy., W. M. Mackay, P. O. Box 1818, New York, N. Y.

American Society of Inspectors of Plumbing and Sanitary Engineers.
Jan. 20-22, 1910. Annual convention at Trenton, N. J. Secy., C. S. McCosker, Mobile, Ala.

Connecticut Society of Civil Engineers.
Feb. 8, 1910. Annual meeting at New Haven, Conn. Secy., J. Frederick Jackson, Box 1304, New Haven, Conn.

Illinois Association of Municipal Contractors.
Feb. 24-26. Annual meeting at Chicago, Ill. Secy., Orie T. Dunlap, Edwardsville, Ill.

Illinois Lumber Dealers' Association.
Feb. 16-18. Annual meeting at Chicago, Ill. Secy., Geo. K. Hotchkiss, 315 Dearborn St., Chicago.

Illinois Masons' Supply Association.
Feb. 16-18. Annual meeting at Chicago, Ill. Secy., Geo. K. Hotchkiss, 315 Dearborn St., Chicago.

Illinois Society of Engineers and Surveyors.
Jan. 26-28, 1910. Annual meeting at Cairo, Ill. Secy., E. E. R. Tratman, 1656 Monadnock Block, Chicago, Ill.

Indiana Engineering Society.
Jan. 14-16, 1910. Annual convention at Indianapolis, Ind. Secy., Chas. Brossman, Union Trust Bldg., Indianapolis, Ind.

Interstate Mantle and Tile Dealers' Association.
Feb. 15-16. Annual meeting at Chicago, Ill. Pres., Joseph W. Lantry, Wm. H. Jackson Co., Union Square, New York City.

Iowa Association of Cement Users.
March 9-11, 1910. Annual meeting in Cedar Rapids, Ia. Secy., Ira A. Williams, Iowa State College, Ames, Iowa.

Iowa Engineering Society.
Feb. 16-17, 1910. Annual convention at Cedar Rapids, Ia. Secy., A. H. Ford, Iowa City, Ia.

Michigan Engineering Society.
Jan. 12-14, 1910. Annual meeting at Lansing, Mich. Secy., Miss L. Holmes, 574 Wealthy Ave., Grand Rapids, Mich.

National Association of Cement Users.
Feb. 21-25, 1910. Annual meeting at Chicago, Ill. Secy., Geo. C. Wright. Address all communications to Edw. E. Krause, Asst. to the President, Harrison Bldg., Philadelphia, Pa.

National Brick Manufacturers' Association.
Feb. 7-12, 1910. Annual convention at Pittsburg, Pa. Secy., T. A. Randall, Indianapolis, Ind.

Ohio Engineering Society.
Feb. 8-10. Annual meeting at Columbus, Ohio. Secy., C. J. Knisley, New Philadelphia, O.

Northwestern Cement Products Association.
Feb. 18-21, 1910. Annual meeting at Chicago, Ill. Chairman of Executive Committee, O. U. Miracle, Minneapolis, Minn.

Personals.

Mr. J. H. Weatherford has been re-elected City Engineer of Memphis, Tenn., under the new commission form of government, for a term of two years.

John H. Lidgerwood, Vice-President and Treasurer of the Lidgerwood Mfg. Co., of New York City, died Jan. 1 at his home in Morristown, N. J., aged 80 years.

Camille S. D'Invellieres, Engineer of Construction for the Pennsylvania R. R. in Pennsylvania, died Jan. 2 at his home in Cresson, Pa., from pneumonia. He was 58 years old.

Mr. F. J. Fleichbauer, Consulting Engineer, has become associated with the Wm. Graver Tank Works, and will be located at the Chicago offices of the company at 413 The Rookery, Chicago, Ill.

Mr. George W. Hackett, Deputy City Engineer of Utica, N. Y., has opened an office in the Clarendon Bldg. in that city, where he will engage in a general engineering and construction business.

Mr. Ernest J. Lederle, Consulting Sanitary Engineer for the New York State Water Supply Board and the New York City Water Supply Board, has been appointed Health Commissioner of New York City to succeed Dr. Thomas A. Darlington.

Mr. John T. Featherston, of New York City, who passed at the head of the list at the recent civil service examination in Chicago for the position of Street Superintendent, has declined to take the position. Mr. John B. Hittell, who was second on the list, will probably be appointed to the position.

Mr. W. H. Zimmerman, formerly Manager for the Michigan Power Co. in Lansing, Mich., has been retained by the Michigan State Railway Commission as Consulting Engineer under the law giving the commission certain supervisory powers over water power and electric power companies, and providing for such an appointment.

Mr. Theodore McKibben, Assistant Engineer at Minden, Mo., has been appointed Chief Clerk in the office of Mr. J. M. Meade, Engineer of the eastern lines of the Santa Fe, at Topeka. Mr. James Dansey, formerly Chief Clerk in that office, has gone to Winslow, Ariz., where he will have charge of a part of the double tracking work which the Santa Fe is beginning in that state.

Mr. Alexander B. Shepherd, who has been Superintendent of the Bureau of Water Supply and Distribution of Pittsburg, Pa., for 14 years, and who served as Acting Director of the Department of Public Works during two years of the administration of Mayor George W. Guthrie, will retire from the city service at the end of this month. Mr. Shepherd leaves the city's employ to become General Manager of the transportation interests of the Jones & Laughlin Steel Co., and it is understood that he is to be elected a vice-president of the company. He will have charge of the Monongahela Connecting R. R., which, according to recent announcement, is to be extended to the great lakes, and will have charge of all other transportation business of the company. It is understood that his salary will be $10,000 a year. His salary from the city is $4,000 a year.

Mr. James V. Costigan has associated with himself Mr. E. H. Cahoon and Mr. C. F. Beck, under the corporate name of The Portage Engineering Co., with offices in the Doyle Block, Akron, O. The new firm will carry on a general engineering business, comprising civil, mining, municipal and hydraulic engineering and land surveying, including the designs, plans and specifications, inspection and superintendence of any work prosecuted under the foregoing heads. Mr. Cahoon was formerly Assistant Engineer of Construction of the W. & L. E. R. R. Co., and for the past three years has held the position of City Engineer of St. Clairsville, O. Mr. Beck, after completing a course in Civil Engineering in Case School, accepted a position with the Land Department of the Northern Pacific R. R. Co. and later became Chief Draughtsman and Bridge Designer of the Akron, Canton & Youngstown Ry.

The Civil Service Commission of Chicago, Ill., will hold an original entrance examination on Feb. 2d for Chief Engineer of the Board of Education. The occupant of this position is over all the school engineers as well as the general office force of the engineering department. The position is one requiring a man of executive ability as well as highly technical qualifications. The salary paid for the late occupant of this position was $6,000 a year, and it is understood that this amount would be increased if a man of the highest ability is secured. Local residence is waived in this examination and the subjects and weights are as follows: Experience, tending to qualify, 4; technical knowledge required for the position to be filled, 3; special subject, 2; mathematics, 1. Under special subject it is possible that the commission may hold an oral test covering matters of administration. This examination will cover three days' time and applicants will have to come to Chicago to take it. Application blanks may be had upon application to the Civil Service Commission, Chicago, Ill., and must be filed not later than 5 p. m., Feb. 1st.

The U. S. Civil Service Commission, Washington, D. C., will hold an examination on Feb. 16-17, 1910, at various cities throughout the country to secure eligibles from which to make certification to fill vacancies as they may occur in the position of hydraulic engineer in the Water Resources Branch of the Geological Survey. The salaries range from $1,200 or less to $2,400 per annum and will be determined chiefly by the character of the training and experience of the eligibles. The U. S. Civil Service Commission will also hold an examination on Feb. 16, 1910, to secur eligibles for temporary employment as topographic aid under the Geological Survey during the field season. The entrance salary ranges from $40 to $75 a month. Appointment to permanent positions will be made only of persons who qualify in and are certified from the junior topographer examination. An examination for junior topographer will be held on Feb. 2-3, 1910. An applicant who desires to be examined for both positions must file a separate application for each position.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Graphite as a Lubricant.—Paper, 6x9 ins., 60 pp. Joseph Dixon Crucible Co., Jersey City, N. J.

This is the eleventh edition of a work on lubrication, of considerable value to men who use machinery and should be of especial use to contractors who have frequently to use partly worn machinery. By adding graphite to the oil the effect on the running of gears is remarkable in its improvement.

Rock Drills.—Wood Drill Works, Patterson, N. J.

This circular gives a description of the test applied to Wood rock drills, and the opinions of Prof. A. C. Dart of the University of Wyoming, and J. M. Carson, Jr., of the West Point Military Academy as to work accomplished with the Wood rock drill.

The Grimm Wood Worker. Paper, 4½x7 ins., 24 pp. Littlefield & Clark, 39 Erie St., Buffalo, N. Y.

The Grimm Wood Worker is a portable circular saw outfit for contractors' use, with gasoline engine attached. It has attachments so it can be used to rip or crosscut boards, mould and shape, groove and cut tenons, joint and edge, bore, sand or be used for jig sawing.

Jeffrey Screens.—Paper, 6x9 ins., 22 pp. The Jeffrey Mfg. Co., Columbus, Ohio.

Revolving and shaking screens in great variety are here illustrated and described.

Linolite Illuminating System.—Paper, 6x9 ins., 8 pp. Electrical Dept. of the H. W. Johns-Manville Co., 100 William St., New York.

The novel feature in the linolite system of illumination is the tubular lamp with reflector.

Deane Steam Pumps.—Paper, 5¼x8 ins., 54 pp. The Deane Steam Pump Co., Holyoke, Mass.

This booklet contains a list of places where Deane pumping engines have been furnished for use on water works service, the year when they were erected, size and daily capacity in U. S. gallons.

Expansion Bolts.—Paper, 6x9 ins. Steward & Romaine Mfg. Co., 124 N. Sixth St., Philadelphia, Pa.

This is a very complete catalog of expansion bolts and fittings of great use to contractors.

Concrete Telegraph and Trolley Poles.—A. C. Chenowith, 16 Court St., Brooklyn, N. Y.

This circular describes the Chenowith concrete pole with a hollow tapered center.

Industrial Photography.—Paper, 6x9 ins., 8 pp. Williams, Browne & Earle, 918 Chestnut St., Philadelphia, Pa.

This circular explains the value of photography for industrial purpose and gives descriptions and prices of outfits.

The Parmley System of Reinforced Concrete.—Paper, 6x9 ins., 24 pp. Walter C. Parmley, Everett Bldg., New York, N. Y.

Mr. Parmley, while an Assistant Engineer in Cleveland, Ohio, patented a system of reinforcement for sewers, manholes, conduits and tunnels. This catalog describes and illustrates his system, which he contracts for and allows to be used on royalty terms.

Good Roofs.—Paper, 6x9 ins., 32 pp. Stowell Manufacturing Co., Jersey City, N. J.

This catalog describes 10 different "ready roofing" materials made by this company and paints, asphalts, etc., for roofing purposes.

Engineering-Contracting Monthly Review Index of Civil Engineering Literature.

A classified index and review of the civil engineering papers, articles, reports, pamphlets and books published during the month just passed is given in the succeeding pages. The literature indexed and reviewed—with the exception of books—relates solely to civil engineering. In the section devoted to Book Reviews all books in all branches of engineering are listed as received and such of them as seem worthy are reviewed as fully as due regard for conciseness will permit. In choosing books for review rigid selection is exercised. Next to careful choice of books for review timeliness of review is sought. All books are reviewed within a month of their receipt. The same statement is true of the articles and papers that are indexed. Also, as in choosing books for review, the choice of articles and papers for indexing is based on merit. Numerical strength in "titles indexed" is not sought; excellence of selection is sought.

The purposes of the Monthly Review Index are: First, to inform civil engineers and contractors of the articles and papers of merit that are published each month, in such a way as will give a clear idea of their character and scope; second, to supply the user with the date and place of publication, the length of each article and the cost at which it can be secured. The name, adopted abbreviations, place of publication and price per number of each periodical examined for civil engineering articles are given in the list immediately following. The other information is given in the index proper for each article separately.

Books reviewed will be sent post paid on receipt of price by the Book Department of ENGINEERING CONTRACTING; periodicals, etc., containing articles indexed should be ordered direct from the publishers.

LIST OF PERIODICALS INDEXED.

American Architect (Am. Arch.), New York, N. Y.; w; 7x10 in.; 15 cts.
American Builders' Review (Am. Bldrs. Rev.), San Francisco, Cal.; m; 7x10 in.; 50 cts.
American Carpenter and Builder (Am. Car. & Bldr.), Chicago, Ill.; New York, N. Y.; m; 7x10 in., 20 cts.
American Engineer and R. R. Journal (Am. Engr. & R. R. Jl.), York, N. Y.; m; 7x10 in.; 20 cts.
American Gas Light Journal (Am. G. L. Jl.), New York; N. Y.; w; 10x13 in.; 10 cts.
American Institute of Electrical Engineers Proceedings (Am. I. of E. E. Proc.), New York, N. Y.; m; 4x7 in.; 50 cts.
American Machinist (Am. Mchst.), New York; w; 7x10 in.; 15 cts.
American Society of Civil Engineers Proceedings (Am. Soc. C. E. Proc.), New York, N. Y.; m; 4x7 in.; 75 cts.
American Society of Mechanical Engineers Journal (Am. Soc. M. E. Jl.), New York, N. Y.; m; 4x7 in.; $1.
Annales des Ponts et Chaussees (An. P. & C.), Paris, France; m.
Applied Science, Toronto, Ont.; m; 6x9 in.; 20 cts.
Architects and Builders Journal (Arch. & Bldrs. Jl.), Baltimore, Md.; m; 9x12 in.; 20 cts.
Architects and Builders Magazine (Arch. & Bldrs. Mag.), New York, N. Y.; m; 5x8 in.; 20 cts.
Architect and Engineer of California (Arch. & Engr.), San Francisco, Cal.; m; 5x7 in.; 15 cts.
International Railway Congress Bulletin (Int. Ry. Cong. Bul.), Brussels; m; 50 cts.
California Journal of Technology (Cal. Jl. of Tech.), Berkeley, Cal.; m; 4x7 in.; 25 cts.
Canadian Architect (Can. Arch.), Toronto, Ont.; m; 7x19 in.; 20 cts.
Canadian Cement and Concrete Review (Can. Cem. & Conc. Rev.), Toronto, Ont.
Canadian Engineer (Can. Engr.), Toronto, Ont.; w; 7x11 in.; 20 cts.
Canadian Machinery and Manufacturing News (Can. Mach. & Mfg. News), Toronto, Ont.; m; 7x10 in.; 15 cts.
Canadian Mining Journal (Can. Min. Jl.), Toronto, Ont.; bi-w; 7x10 in., 20 cts.
Canadian Municipal Journal (Can. Mun. Jl.), Montreal, Que.; m; 6¾x10 in.; 10 cts.
Canadian Society of Civil Engineers Proceedings (Can. Soc. C. E. Proc.), Montreal; m; 4x7 in.; 50 cts.
Carpentry and Building (Carp. & Bldg.), New York, N. Y.; m; 11x8 in.; 10 cts.
Cassier's Magazine (Cas. Mag.), New York; m; 5x8 in.; 25 cts.
Cement, New York, N. Y.; bi-m; 5x8 in.; 25 cts.
Cement Age (Cem. Age), New York, N. Y.; m; 4¾x8 in.; 15 cts.
Cement and Engineering News (Cem. & Eng. News), Chicago, Ill.; 7x10 in ; 25 cts.
Cement Era (Cem. Era), Chicago, Ill.; m; 7x10 in.; 10 cts.
Cement-Record (Cem. Rec.), m; 4¾x8 ins.; 15 cts.
Cement World (Cem. Wld.), Chicago, Ill.; m; 9x11 in.; 10 cts.
Chemical Engineer (Chem. Engr.), Chicago, Ill.; m; 4x7 in.; 15 cts.
Clay Worker (Cl. Wkr.), Indianapolis, Ind.; m; 7x10 in.; 20 cts.
Compressed Air (Comp. Air), New York, N. Y., m; 5x7 in.; 10 cts
Concrete, Detroit, Mich.; m; 6x9 in.; 15 cts.
Concrete Age (Conc. Age), Atlanta, Ga.; m; 9x11 in.; 10 cts.
Concrete and Constructional Engineering (Conc. & Cons. Eng.), London, England; m; 5x7 in.; 25 cts.
Concrete Engineering (Conc. Eng.), Cleveland, O.; m; 7x10 in.; 10 cts.

ROADS AND STREETS.

Possibilities of Portland Cement as a Road Material.—By Logan Waller Page. Eng. Rec., Dec. 25, 1909. 1 p.

A paper read by the Chief of the U. S. Bureau of Road Inquiry before the Association of American Portland Cement Manufacturers. He describes experiments the government is making in mixing asphalt and Portland cement in order to get the best results from both materials in road building.

Extracts from Papers Before the British Road Conference of 1909.—Eng. News., Dec. 16, 1909. 5 pp.

Nine papers on road construction, maintenance and dust prevention are here abstracted. It is good reading.

The Construction and Preservation of Macadam and Bituminous-Macadam Roads.—By Logan Waller Page. Eng. News., Dec. 9, 1909. 1½ pp.

This is an abstract of a paper read before the Western Society of Engineers, Nov. 3, 1909, and will be printed in full in the Journal of the Western Society. It is a discussion on the present day problems of macadam road construction by the Director of the Bureau of Road Inquiry of the U. S. Government.

Street Flushing in New York.—Mun. Jl. & Eng., Dec. 29, 1909. 2 pp.

Gives results of tests made on washing paved streets as compared with sweeping for the purpose of cleaning them. A table is presented showing the number of square yards cleaned per day by different makes of machines and gals. of water used per 1,000 sq. yds. cleaned.

Draining Street Intersections.—By S. D. Newton. Mun. Jl. & Eng., Dec. 29, 1909. 2 pp.

The author is engineer of Knoxville, Tenn., and this article is a reprint of a paper read at the 1909 convention of the American Society of Municipal Improvements. A paper of considerable value to engineers in towns where storm sewers are not provided.

Rubbish and Snow Removal.—Mun. Jour. & Eng., Dec. 22, 1909. 5 pp.

A description of the work done in New York city in cleaning and sprinkling streets.

Road Tarring.—Mun. Jour. & Eng., Dec. 8, 1909. 1½ pp.

Abstract of a paper by W. H. Fulweiler in Journal of The Franklin Institute Sept., 1909, describing all the leading methods for improving macadam roads with tar.

Dangers of Street Dust.—Mun. Jour. & Eng., Dec. 8, 1909. 1 p.

Gives data from New York city reports and medical sources to show that street sweepers between the ages of 25 and 45 years are peculiarly liable to consumption.

Pavements and Grade Limitations.—By S. C. Thompson. Mun. Jour. & Eng., Dec. 8, 1909. 1½ pp.

Abstract of paper read at 1909 convention of the American Society of Municipal Improvements, on kinds and costs of pavements in New York city on specified grades.

Drainage at Street Intersections.—By J. H. Weatherford. Mun. Jour. & Eng., Dec. 15, 1909. 4½ pp.

This is a paper read before the 1909 convention of the American Society of Municipal Improvements. Discusses surface drainage of streets in cities without storm sewers. The illustrations show methods used in Memphis, Tenn. Gives costs.

Concrete Blocked Pavement.—Mun. Jour. & Eng., Dec. 1, 1909. 4½ pp.

Describes the reconstruction work of the Knoxville (Tenn.) Railway & Light Co. A cross section of the roadbed is shown with details of the blocked pavement. Base is 5¼ ins. thick of 1:2½—5 concrete. Top surface is 1¾ ins. thick of 1:1½ cement and crushed granite. Surface is given rough finish and blocked with grooving tools. Expansion joints ¾-in. wide, filled with asphalt filler are placed 100 ft. apart after setting of finished pavement is completed.

Paving Practice with Respect to Crowns of Roadway Pavements and Concrete Pavements.—By George C. Warren. Eng. News., Dec. 2, 1909. 1½ pp.

Mr. Warren out of his experience as a paving contractor gives rules in his opinion best for computing crowning for roadways; also gives practical hints on construction of concrete foundations.

The Lesson Taught by the Extravagantly High Cost of Pavement Repairs Done by Day Labor in Brooklyn, N. Y.—Eng.-Contg., Dec. 1, 1909. 1¼ pp.

Gives statistics showing high cost of pavement repairs and discusses them in the light of the day labor policy of doing municipal construction work.

Cost of Patching Asphalt Pavement Using a Small Repair Plant.—Eng.-Contg., Dec. 15, 1909. ¾ p.

Describes plant and methods used in repairing some 6.64 miles of asphalt streets by city labor, with cost of plant, materials, labor and itemized unit costs of repairs.

Standard Details of the New York State Highway Department for State and County Roads.—Eng.-Contg., Dec. 15, 1909. 2¼ pp.

Illustrates and describes standard plans for road sections, concrete culverts, concrete ditch covers, dry inlets, cast iron culverts, concrete retaining walls, concrete catch basins, mile posts and guide boards, and guard rails.

Macadam Road Construction in Ohio.—Eng.-Contg., Dec. 8, 1909. ⅓ p.

Describes general practice in constructing macadam roads employed by the Ohio State Highway Department, as given by State Highway Commissioner J. C. Wonders.

Specifications of the New York State Highway Department for Bituminous Macadam and Characteristics Required of Bituminous Materials.—Eng.-Contg., Dec. 8, 1909. 1¾ pp.

This is a reprint of the standard specifications issued by the New York State Highway Department.

Hints in Oiling Macadam.—Eng.-Contg., Dec. 1, 1909. ¼ p.

Gives directions for oiling macadam roads by V. M. Frodden, Superintendent of Streets, Alameda, Cal.

Standard Specifications of the New York State Highway Commission for Brick Pavement.—Eng.-Contg., Dec. 15, 1909. 1½ pp.

Reprint of revised specifications issued by the Bureau of Plans and Surveys of the New York State Highway Commission.

Methods and Cost of Sprinkling Road Surfaces With Oil.—By W. A. Gillette. Eng.-Contg. Dec. 8, 1909. 1½ pp.

Describes methods to be followed in preparing the roadbeds and in applying and working the oil; describes special oil distributor and oil pumping plant for filling oil wagons from tank cars, and gives itemized unit costs of oil treatment. An unusually practical article on road oiling.

Method and Cost of Oiling Park Roads at Kansas City, Mo.—Eng.-Contg., Dec. 1, 1909. 1 p.

Describes the kinds of oil used and the methods of application and gives costs of oiling 672,188 sq. yds, in 1908. Plans are given of a plant for unloading tank cars of road oil.

Cost of Road Treatment With Oil and Dust Preventives at Washington, D. C.—Eng.-Contg., Dec. 29, 1909. ½ p.

Describes briefly 12 jobs of road treatment and gives itemized cost of each.

System for Recording and Accounting for Supplies and Labor in the Paving Division of a City Street Department.—Eng.-Contg., Dec. 29, 1909. 2¾ pp.

Illustrates and describes purpose of and manner of using forms for requisition of supplies, delivery tickets, receiver's daily report, inspector's daily report, custodian's final report, record of time and work of teams, etc.

Study of Street Cleaning Conditions in Boston with Data on the Cost of Snow Removal, Push Cart Patent System, Machine Sweeping and Maintenance of Horses.—Eng.-Contg., Dec. 22, 1909. 3¾ pp.

Describes methods employed and gives costs for Boston, Mass., of snow removal, push cart patent system of cleaning and machine sweeping. Very full data are given on costs of keeping department horses. A notably interesting article.

Regrading the Streets of Seattle.—Gd. Rds. Mag., December, 1909. 4 pp.

General article describing the regrading of the streets of Seattle, Wash., by the hydraulic sluicing method.

Road Materials and Some Simple Rlues for Testing Them.—By Austin B. Fletcher. Gd. Rds. Mag., December, 1909. 3 pp.

A paper read at the First American Congress of Road Builders, at Seattle, Wash. In it the author gives simple tests for the following materials entering into the construction of roads: Sand and clay, gravel, rock suitable for macadam purposes, and bituminous materials. For the last material he gives the Massachusetts Highway Commission's specifications for refined tar, asphaltic oil and oil asphalt.

Crowns of Roadway Pavements.—By George C. Warren. Gd. Rds. Mag., December, 1909. 1½ pp.

Abstract of a paper read before the last convention of the American Society of Municipal Improvements. The paper treats of various formulas and rules for determining the crown of roadway.

Bituminous Road Materials.—By Prevost Hubbard. Gd. Rds. Mag., December, 1909. 3 pp.

A paper discussing the general principles for the use of bituminous road materials. The paper was read at the second annual Good Roads Convention of the American Automobile Association at Cleveland.

SEWERS.

Asphalt Joints for Sewer Pipe.—By Carl Hennecking. Eng. Rec., Dec. 25, 1909. 1 p.

Describes the joints used in German sewers, made of asphalt to secure watertightness. This asphalt is a special compound which does not soften under about 131° F.

Utilizing a Creek Valley Bed for a City Sewer.—By Harlow Gale. Eng. Rec., Dec. 25, 1909. ⅔ p.

This describes a piece of work in Minneapolis, Minn., in which a sewer was laid in a creek bed underneath the bottom of the creek, which bottom was afterwards restored to its former natural condition so that the creek now runs over the sewer.

Sewage Disposal at Country Houses.—Eng. Rec., Dec. 18, 1909. 2 pp.

An abstract of a paper read by Mr. John D. Watson, Chief Engineer of the Birmingham, Thames and Rea District sewage disposal works in England. This paper on the disposal of sewage at country houses is well worth study.

Experiments on the Passage of Bacteria Through Soil.—Eng. Rec., Dec. 4, 1909. 1 p.

Describes some interesting experiments made in Berlin on the passage of bacteria through sandy soil, to determine the liability of endangering a water supply from wells. It was found that the strongest bacteria travelled the 69 ft. through the soil in such small numbers that it was found only 1 in 40,000 placed in the hole ever reached the well. It was concluded therefore that pathogenic bacteria, being weaker than the innocent ones chosen, would stand a very small chance of polluting the wells.

The Construction of the Bronx Storm Relief Sewer.—Eng. Rec., Dec. 4, 1909. 3 pp.

A purely descriptive article with illustrations of the construction of a sewer 6,900 ft. long with a cross sectional area of approximately 200 sq. ft.

Material for Sewer Inverts.—Eng. Rec., Dec. 4, 1909. ⅔ p.

Abstract of a paper read at the 1909 annual meeting of the American of Municipal Improvements, describing experiments made by Mr. Edward S. Rankin, of Newark, N. J., on materials used for sewer inverts. The conclusion reached is that good concrete is better than tile and there is no necessity for lining concrete sewers with tile.

A Siphon Tunnel Under the River Dee.—Eng. Rec., Dec. 4, 1909. 2 pp.

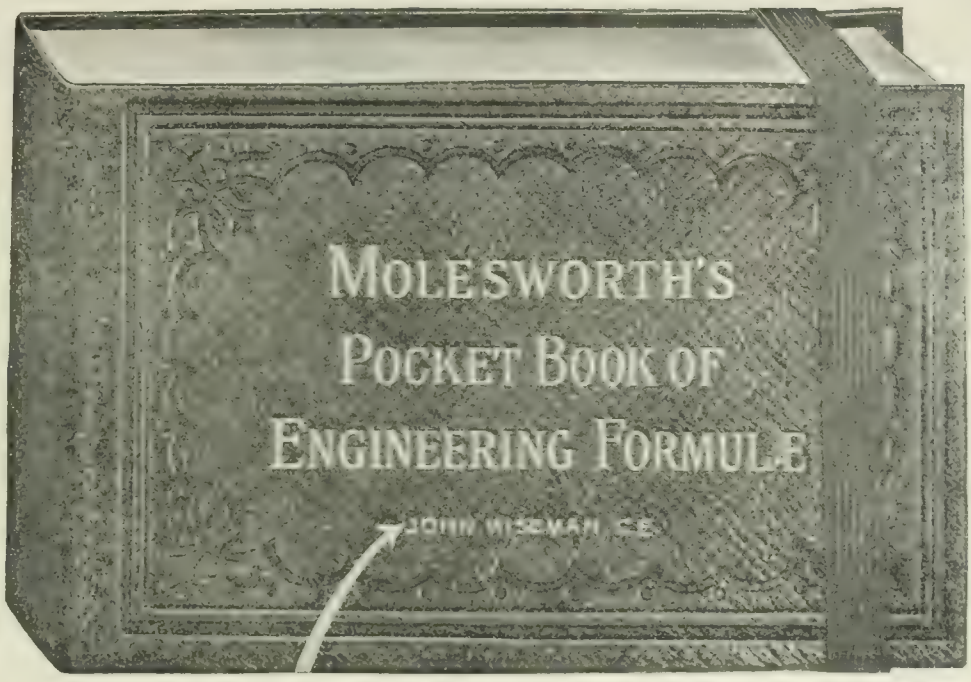
Aberdeen, Scotland, has found it necessary lately to conduct its sewage through a long pipe to an outfall in the sea. This involved going under the River Dee with an inverted siphon, having an internal diameter of 8 ft. 4 ins., a length of 344 ft. and put at a depth so the top of the tunnel lining is 41 ft. below the surface of the river. This article describes the siphon with illustrations. The tunnel is divided really into two siphons.

Some Notes on the Separation of Solids from Sewage and Waste Liquors.—By James P. Norrington. Eng. News., Dec. 30, 1909. 1¼ pp.

Describes a German and an English sedimen-

Don't carry in your HEAD— Carry them in your POCKET!

those innumerable formulae that you need in your business every day.



Synopsis of Contents

26th Edition

Levelling and Surveying.
Strength and Weight of Materials.
Earthwork and Brickwork, Masonry, Arches and Tunnels.
Struts, Columns, Beams, Floors and Roofs.
Girders and Bridges.
Railways and Roads.
Hydraulics, Canals, Sewers, Waterworks, Docks, Irrigation, Breakwaters, Diving and Dredging.
Heat, Light, Color and Sound, Ventilation, Warming, Refrigeration and Gas.
Laws of Motion.
Millwork.
Workshop Recipes
Machinery and Manufacturing.
Steam, Oil and Gas Engines.
Motive Power.
Wind, Windmills and Pneumatic Machinery.
Ships and Steam Navigation.
Buoys and Moorings.
Weights and Measures.
Algebraical Signs and Formulae.
Trigonometry and Calculus.
Conic Section Curves, etc.
Mensuration.
Logarithms.
Squares, Cubes, Roots, etc.
Electrical Supplement.

YOUR NAME IN GOLD ON COVER **FREE** CUT SHOWS EXACT SIZE OF POCKETBOOK

MOLESWORTH'S Pocket Book of Engineering Formulae—the only *real* pocket-book for Civil, Mechanical and Electrical Engineers. Enables you to carry *your* formulae in your *pocket*, in *compact* form and ready for *instant* use. It's a time-*saver*, a brain-fag-*preventive* and a mistake-*eliminator*—*up-to-date* in *every* respect (26th edition just issued). *Comprehensive* but *stripped* of *all* extraneous matter and abstruse mathematical terms. Indexed so as to make *any* of its contents available *at a glance*.

A Practical Book *for* Practical Men *by* Practical Men. A copy Will Take a Load Off Your Mind.

Sent postpaid upon receipt of $2.00. Price includes your name in Gold on Cover.

SPON & CHAMBERLAIN, 123 C.E. Liberty St., New York

tation tank and compares their comparative worth. These two types remove such a large per cent of solids (75% to 96%) that in some cases of weak sewage further treatment by filters is deemed unnecessary. Abstract of a paper read before the Incorporated Association of Municipal and County Engineers, England. Oct., 1909.

Disinfection of Sewage.—By Earle B. Phelps. Mun. Jour. & Eng., Dec. 22, 1909. 2½ pp.

A paper read before the American Society of Municipal Improvements. Gives a general resume of sewage purification and tells when and why sterilization is proper. Costs are given ranging from 52 cts. per million gallons containing 1 part chlorine per million to $5.05 per million gallons containing 15 parts chlorine per million.

Standards for Sewage Effluents.—By Dr. John Thresh. Surveyor, Dec. 17, 1909. 3 pp.

A paper read before the 1909 annual convention of Sewage Works Managers in London, England, Dec. 9, 1909, describing simple tests devised by Prof. Phelps of the Massachusetts Institute of Technology, Boston, Mass., and published by him in a bulletin entitled "Putrescibility and Stability of Sewage Effluents."

Sewage Clarification Tanks.—Mun. Jour. & Eng., Dec. 8, 1909. 2 pp.

Describes the Kessel tank operating by a siphon action and also a concrete separator tank of high efficiency in use in England.

Explosions of Sewer Gas in New York City.—By A. A. Breneman. Eng. News, Dec. 2, 1909. 1⅓ pp.

Describes investigations made into causes of explosions in sewers, seemingly on the increase. The cause is ascribed to gasoline from automobile garages and recommendations are made for traps to minimize the danger.

Specifications for Concrete Sewers at Richmond, Ind.—Eng.-Contg., Dec. 29, 1909. ½ p.

Reprint of specifications employed by city of Richmond, Ind., for both monolithic concrete and concrete pipe sewers.

Construction of the Baltimore Sewage Disposal Works.—Eng. Rec., Nov. 13, 1909, 2½ pp.; Nov. 20, 1909, 3 pp.

These articles describe the construction of one of the largest sewerage purification plants in the world, showing plan of work and layout of contractor's plant with descriptions of methods adopted during construction.

WATERWORKS AND HYDRAULICS

Some Phases of Hydroelectric Enterprises.—Eng. Rec., Dec. 18, 1909. 2 pp.

Abstract of a paper by Mr. Henry L. Doherty before the American Institute of Electrical Engineers. Of considerable value to men who may some time try to market a water power for the generation of electric energy.

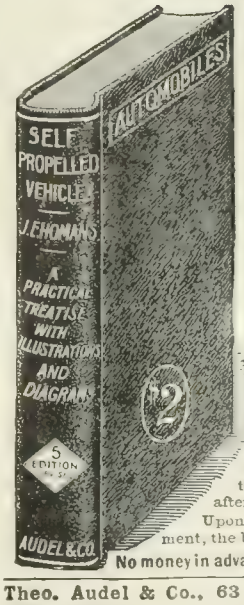
Design and Operation of a Mechanical Filter Plant.—Eng. Rec., Dec. 19, 1909. 3 pp.

This is a very good article for men who are looking up the subject of mechanical filtration (or as it is generally termed, rapid sand filtration). Describes a plant having a 2,000,000-gallon daily capacity.

Cost of Laying Water Mains at Cheyenne, Wyo.—By H. G. Porak. Eng. Rec., Dec. 4, 1909. ½ p.

This article gives the costs of excavating and backfilling trenches 5 ft. deep and laying in them pipes ranging in diameter from 4 ins. to 20 ins. The 10-in. pipe was laid in a trench

HOW TO RUN AN AUTO



"Homans' Self Propelled Vehicles" gives full details on successful care, handling and how to locate trouble.

Beginning at the first principles necessary to be known, and then forward to the principles used in every part of a Motor Car.

It is a thorough course in the Science of Automobiles, highly approved by manufacturers, owners, operators and repairmen. Contains over 400 illustrations and diagrams, making every detail clear, written in plain language. Handsomely bound.

PRICE $2 POSTPAID

ON APPROVAL

The only way the practical merit of this MANUAL can be given is by an examination of the book itself, which we will submit for examination, to be paid for or returned, after looking it over.

Upon receipt of the following agreement, the book will be forwarded.

No money in advance required, sign and return

Theo. Audel & Co., 63 Fifth Ave., New York

Kindly mail me copy of Homans' Automobiles, and, if found satisfactory, I will immediately remit you $2.00, or return the book to you

NAME .....

OCCUPATION .....

ADDRESS .....

where a 6-in. was already laid and replaced the smaller pipe.

The Pipe Line of the Canon City Water Supply System.—Eng. Rec., Dec. 4, 1909. 3⅜ pp.

Water will be delivered under a head of 210 ft. in Canon City by the new system. The pipe line consists of 1,500 ft. of 36-in. steel and approximately 35,000 ft. of 30-in. wood stave pipe. This article describes the work of putting in this pipe line with some remarks on the head works. Illustrated by half-tone views and a few details.

Data Relating to Awards for Water and Water-Power Diversion.—Eng. News, Dec. 16, 1909. 3 pp.

This article is condensed from report of committee of New England Water Works Association, Dec. 8, 1909. The paper contains considerable data on water sheds of New England and information on the value of water power.

Effect of Roughness of Bed on Depth of Water and Distribution of Velocity.—By E. C. Murphy. Eng. News, Dec. 30, 1909. 1⅓ pp.

A paper describing experiments made by the U. S. Geological Survey of flow of water. Considerable data is given in tables and diagrams. The results are given in an exponential formula for mean velocity in a channel. The experiments were made to determine (1) the relative effect of roughness of bed on the distribution of velocity in vertical planes, and (2) the relative effect of roughness of bed on mean and bottom velocity for various slopes.

Cleaning Water Filters.—By S. Bent Russell. Eng. News, Dec. 23, 1909. 2 pp.

This is an abstract of a paper entitled "Notes on Certain Points in the Design of Large Filtration Plants," read before the St. Louis Engineers' Club. Very little literature on mechanical filters has appeared that is of service to designers and this paper is timely and valuable.

The Multiple Arch Dam.—By C. E. Grunsky. Jour. El. P. & Gas, Dec. 25, 1909. 2 pp.

This is a short discussion on points of design of a new form of concrete dam of light arched section without reinforcement. The inventor, John S. Eastwood, described in the Oct. 30 issue of the same paper a dam near Hume, Cal., built on the multiple arch system.

San Francisco's Water System.—By Herman Schussler. Jl. El. P. & Gas, Dec. 11, 1909. 19 pp.

One of the best descriptions of the growth of a water works system for a large city that has been printed. The author has been chief engineer of the Spring Valley Water Works for over forty-five years.

The Partial Failure Through Undermining of the Zuni Dam, New Mexico.—Eng. News, Dec. 2, 1909. 4 pp.

The Zuni dam is 70 ft. high with a crest length of 720 ft. The lower side is a rock fill structure containing 40,160 cu. yds. and the reservoir side is a hydraulic fill dam containing 60,120 cu. yds. of earth with rip rap slope. This type of dam was selected because of its flexibility as the geological formation was not deemed proper for a masonry dam. A portion of the dam settled owing to undermining by underflow, and the selection of this type of dam was thus justified. The article is of value to hydraulic engineers and contains the findings of the consulting engineers as to cost and methods of repair work.

Some Data on Water-Works Maintenance and Operation Gleaned from a Public Service Report.—Eng.-Contg., Dec. 8, 1909. 1⅓ pp.

Extracts from the report for 1908 of the Water Commission of Boston.

The Kensico Reservoir, Catskill Water Supply.—Eng. Rec., Dec. 25, 1909. 1⅔ pp. 1½ pp., ill.

Describes a masonry dam 170 feet high above the bed of the reservoir.

The Water Supply of Springfield, Ohio.—By Paul Hansen. Eng. Rec., Dec. 11, 1909. 3 pp., ill.

The supply is mainly from gravel deposits and this article is one of a sanitary nature showing that only in certain cases can any city be certain to receive a supply of water from gravel beds that is not in danger of contamination. Such methods of filtration are not under as good control as artificially made filtration beds.

Control of Pressure and Flow in Water Dis-

Now Ready

CONCRETE CONSTRUCTION

METHODS AND COST

By

Halbert P. Gillette

M. Am. Soc. C. E., M. Inst M. E.,
Managing Editor, Engineering-Contracting

and

Charles S. Hill, C. E.,

Associate Editor, Engineering-Contracting.

THIS book handles the subject of concrete construction entirely from the view-point of the ***builder*** of concrete structures. The testing of cement, the physical properties of cements and concrete, and the design of concrete structures are not considered. The aim of the authors has been to eliminate all matter not germane to the constructing end of their subject. By doing this it has been possible to crowd a vast amount of detailed information on methods and cost of concrete construction into a volume of moderate size. The book is a treatise on the ***methods and cost*** of building in ***concrete.***

WHILE concrete design is not considered, no designer of concrete can be a really good designer without having a profound knowledge of costs and of practical methods of construction. This book will be of interest therefore to every engineer and architect who is engaged in designing concrete structures. It should be of particular assistance, however, to the contractor or engineer engaged in the actual work of making and placing concrete.

THE methods given are practical methods and they are so given that the practical man can use them. The costs given are actual costs, itemized, analyzed and reduced to units. Costs of material, costs of transporting, costs of mixing, costs of placing, costs of tamping, costs of finishing, costs of forms, costs of bending and placing reinforcement, costs of waterproofing, costs of superintendence, costs of plant, interest charges, depreciation charges are all given, and to make these costs useful, the conditions and the methods of doing the work are stated in each case.

Cloth, 6 x 9 inches, 700 pages, 306 illustrations, $5 net, postpaid.

The Myron C. Clark Publishing Co.

355 Dearborn St., Chicago, Ill.

tribution Systems.—Eng.-Contg., Dec. 1, 1909. 1¼ pp.

Discusses conditions calling for pressure control and describes and illustrates an automatic controlling altitude valve.

Methods and Costs of Laying About 1¼ Miles of 20-in. Cast Iron Water Pipe in Cuba.—Eng.-Contg., Dec. 8, 1909. ⅝ p.

Describes methods of work for trenching, pipelaying and backfilling and also method of testing and gives itemized unit costs of each portion of the work.

New Water Filtration Plant at Toledo, Ohio, With Data on Contract Methods and Costs.—By B. M. Baker. Eng.-Contg., Dec. 1, 1909. 4½ pp.

General description of the structural features of and the construction methods employed in building the new $900,000 water filtration plant at Toledo, O. Itemized contract costs of the plant are given.

Some Reservoir and Filtration Costs and Methods.—Eng.-Contg., Dec. 22, 1909. ⅔ p.

Gives miscellaneous costs for Washington, D. C., on dredging, slope paving, filtration, etc.

Suggestions on the Use of Iron and Lime Process of Water Purification. — By C. Arthur Browne. Eng. News, Nov. 18, 1909. 3 pp.

This is a paper read before the Central States Water Works Association, Sept., 1909. Mr. Brown is the chemist for the American Steel & Wire Company and really developed the method whereby iron sulphate is replacing alumina as a coagulent in water filters. The paper is a text for men operating water purification plants and brings the process down to date.

Public Service.—By John Don, Assoc. M. Inst. M. E. F. & W. Eng., Nov. 3, 1909. 2⅔ pp.

This is merely an abstract of a paper describing every filtering system known. The original paper received first award at the "Water Arbitration Prize," 1908, of the Institution of Mechanical Engineers of Great Britain.

Experiments With Double Pitot Tubes.—Eng. Rec., Nov. 27, 1909. 1 p.

Abstract of paper by Mr. K. Ellon, published in the "Zeitscrift" of the Society of German Engineers describing experiments made by himself and Prof. E. Reichel at the Berlin Technical High School. (A German high school ranks with an engineering school of standing in the United States.) A double pitot tube is simply two tubes side by side with their legs extending in opposite directions. Experiments show a tube reads correctly only when the water stream lines are parallel and the leg of the tube is exactly in line with them and against direction of flow. The pitot tube is not recommended for flow-in pipes because of the lack of definite knowledge of water stream lines, and in small pipes the tube itself obstructs flow and increases velocity. The chief claims for use in open water courses are simple construction, permanency of calibration and direct and instantaneous reacting.

The Bernhart Sand Filters, Reading, Pa.—Eng. Rec., Nov. 13, 1909. 2⅔ pp.

An article of value to water works engineers, being a complete description, with many details, of the construction of filters to purify water from Bernhart Creek, Reading, Pa. Capacity, 3,750,000 gallons daily.

DRAINAGE AND IRRIGATION.

The Reclamation Project of the Idaho Irrigation Company.—Eng. Rec., Dec. 25, 1909. 4½ pp.

Describes a project for irrigating 150,000 acres of land in southern Idaho. Gives methods for constructing an earthen dam, principally by hydraulicking.

The Shoshone Dam, U. S. Reclamation Service, Near Cody, Wyo.—By H. N. Savage, M. Am. Soc. C. E. Eng. News, Dec. 9, 1909. 3 pp., ill.

A description, with 9 illustrations, of a curved masonry dam having a height of about 250 ft. above the foundation and costing $515,730. One of the illustrations is a plan of the contractors' layout. Purely a descriptive article.

Proposed Plan for the St. Francis Valley Drainage, a Statement of Methods of Construction and Some Estimates of Cost.—Eng.-Contg., Dec. 22, 1909. 4½ pp.

Describes the plans proposed for this large drainage project, including methods of construction planned and estimates of cost.

RIVERS, HARBORS AND CANALS.

Pier 3 of the Boston Terminal of the Boston and Albany R. R.—Eng. Rec., Dec. 25, 1909. 3 pp.

This pier is 240x781 ft. in extreme dimensions with a number of slips on each side. It is of pile construction and the sheds are fireproofed. General details given and a full description.

Protecting Levee Slopes with Concrete.—Eng. Rec., Dec. 4, 1909. 1 p.

A roadway in Cincinnati constructed on a fill was undermined every time the river rose and this article describes the method adopted for protecting the embankment next the river with a 5-in. blanket of reinforced concrete for a length of 4,800 ft., the reinforcement consisting of ¼-in. round rods placed 36 ins. apart on the slope and half as far apart near the edges.

Design for Concrete Dry-Dock at Pearl Harbor, Hawaii, for the United States Navy.—By R. E. Bakenhus. Eng. News, Dec. 9, 1909. 3½ pp.

A very good description of a dry dock of modern construction. The more important details are illustrated. The present length is 589 ft., but provisions are made so it may be lengthened to 1,200 ft. when necessary. The present length will enable the largest battleship in the world to be docked here when the dock is completed.

Progress of Construction on the Panama Canal During the Year Ending June 30, 1909; Compiled from the Report of the Isthmian Canal Commission.—Eng.-Contg., Dec. 1, 1909, 3⅔ pp.

Gives the latest official estimated itemized cost of the Panama Canal and reviews in a general manner the amount and character of the work done during the year named.

Records and Costs of Excavation on the Main Channel and Lock Work of the Panama Canal for the Year Ending June 30, 1909, with Some Summaries of Excavation Costs.—Eng.-Contg., Dec. 8, 1909, 2½ pp.

Gives outputs and costs of various classes of excavation on each of the three construction divisions of the Panama Canal, and also permits nine tables of itemized unit costs of excavation covering generally a period of two years' work. A valuable analysis of cost data.

RAILWAYS.

Subaqueous Section of the Detroit River Tunnel. Eng. Rec., Dec. 18 and 25, 1909, 5½ pp.

These sections of the Detroit River Tunnel were made of steel, floated to position and sunk. This article describes the methods followed and gives half-tone illustrations.

Railway Terminals and Their Relation to City Planning.—By Frederic A. Delano. Eng. Rec., Dec. 18, 1909, 2½ pp.

This paper was read at the 1909 Convention of the American Institute of Architects. The author is President of the Wabash Railroad Co. It is an interesting addition to the present growing literature on town planning and takes up a phase hitherto glossed over by the majority of earlier writers, most of whom have looked upon town planning from the artistic standpoint

The Bergen Hill Four Track Tunnels, Erie Railroad.—Eng. Rec., Dec. 18, 1909, 2⅓ pp.

This is an illustrated article containing details of arch centering and traveler. The work is in solid rock.

Reconstruction of the Washington Street Tunnel, Chicago.—Eng. Rec., Dec. 11, 1909, 1 p.

The old street car tunnel under the Chicago River was within 10 ft. of the surface of the water and the War Department compelled the city to lower the roof. This was done by putting in steel girders and reinforced concrete slab in the tunnel near the bottom, thus putting it out of commission. Now it is proposed opening a new tunnel under this roof and lowering the sides. This article describes the method proposed by the contractors, with illustrations.

Tunnel Failures and Repairs on the Eastern Railway of France.—Eng. News, Dec. 23, 1909, 3⅓ pp.

This is a very good article for maintenance of way engineers who have in charge old tunnels. It is condensed from an article in the Revue Generale des Chemins de Fer, by M. Siegler, Chief Engineer of Maintenance of Way. The editors of the paper have appended to this

TWO NEW IMPORTANT BOOKS NOW READY

CONCRETE-STEEL CONSTRUCTION

(Der Eisenbetonbau)

BY

PROF. EMIL MÖRSCH

of the Zurich Polytechnic

Authorized Translation of the Third (1908) Edition

By E. P. GOODRICH, C. E.

Mörsch's "Eisenbetonbau" is the clearest exposition of European methods of Reinforced Concrete Construction that has yet been published and is a recognized standard in Europe. It also has had an extensive sale in this country, but the comparatively limited usefulness of the German edition has prompted its translation and publication in English. It contains much information not given in any other book in the English language, and we highly recommend it as a necessary work for every engineer dealing with reinforced concrete design and construction.

Cloth; 6½ x 9½ inches; 364 pages and 350 illustrations. Price, $5.00 net.

INSPECTOR'S HANDBOOK OF REINFORCED CONCRETE

BY

W. E. BALLINGER AND EMILE G. PERROT

This volume was written to fill a place in the literature of reinforced concrete not covered by any other book. It points out the essentials governing the construction of this class of buildings and is divided into three general divisions; each division embracing a study of one of the main elements that enter into the construction of reinforced concrete. These are, first, the "Forms or Falsework;" second, the "Reinforcement," and third, the "Concrete."

It is compact and can easily be carried in the pocket.

Flexible cloth, 4½ x 6½ in., 64 pp.; 6 Folding Plates, and an Appendix of Formulas and Tables. Price, $1.00 net.

We have made a specialty of the literature of Cement and Concrete and have issued a 64 page pamphlet, listing over 100 books on these subjects, with descriptive notes sufficient to enable anyone interested to select the books that best suit his special requirements. This pamphlet will be sent to any address in the world for 5 cents—to cover cost of mailing.

ENGINEERING NEWS BOOK DEPARTMENT

220 Broadway New York

article notes on tunnel repair work with reference to articles previously appearing in Engineering News on this subject.

The Cost of Overhead-Trolley Systems.—By A. D. Williams, Jr. Eng. News, Dec. 23, 1909, ½ p.

A short interurban line was constructed in northwestern Ohio, running along country highways. This article gives the detailed costs of the work per mile. Summarizing the costs were as follows: Bracket arm system, $3,551.31; cross span, 30 and 37 ft. poles, $3,836.25; cross span, 30 and 30 ft. poles, $3,680.25.

Comparison of Gasoline Car, Single-Phase Electric and Steam Locomotive Costs. By W. E. Harrington, B. S. El. Ry. Jour., Dec. 25, 1909, 1 p.

An article making a study of the most desirable form of power car for lightly patronized interurban roads. Costs are shown to be per car mile as follows: Direct current, $0.1717; alternating current, $0.2023; gasoline motor car, $0.142, and steam locomotive with one car, $0.1543.

Life and Maintenance Cost of British Railway Track.—By R. Price Williams. Ry. & Eng. Rev., Dec. 25, 1909, 2 pp.

Abstract of paper read Sept., 1909, before the Iron and Steel Institute. The author discusses increased maintenance costs with a view to forecasting probable future increases. In England he says the mileage in 47 years has a little more than doubled, and the number of cars has only increased three-fold. The tonnage carried has increased nearly five-fold, the number of passengers nearly seven-fold and the working expenses nearly six-fold. He attributes increased maintenance costs to high speeds and increased weights of equipment.

Recent Extensions of the Boston Elevated System.—El. Ry. Jour., Dec. 18, 1909, 8½ pp.

This article contains a map and 5 line drawings showing layouts of some stations, together with several half-tones. The text is of a general descriptive character.

Rail Grooves and Track Gage for Curved Tracks.—Ry. & Eng. Rev., Dec. 11, 1909, 2½ pp.

Extracts from a paper by C. W. L. Fillkins before the American Street & Interurban Railway Association giving the problems met with and presenting simple formulas for computing width of groove for flanges in common use. Gives tabulated flange path data.

Comparison of Operation of the New York and Paris Subway Systems.—By Robert H. Whitten. El. Ry. Jour., Dec. 11, 1909, 7 pp.

This article gives a sketch map of each system to a scale of ½-in. to the mile and plans of cars used on each system. Gives diagrams and tables comparing train headway; yearly ticket sales; traffic density; revenue from transportation; gross revenue from operation and its apportionment, and cost of each system. An analysis accompanies these data.

Cost of Constructing the Miraflores Tunnel on the Panama R. R. Eng.-Contg., Dec. 15, 1909, 1 p.

Describes construction of 736 ft. of tunnel through earth and rock and lined with concrete. General itemized costs of the work are given.

Original Cost and Cost of Reproduction of the Great Northern Railway (768 miles) in the State of Washington.—Eng.-Contg., Dec. 8, 1909, 3¾ pp.

Gives itemized cost of 768 miles of main line and branch line railway owned by the Great Northern Railway in the State of Washington. Costs are compiled from original data collected by the engineers of the Washington State Railroad Commission. The most complete article of [illegible] know.

Methods of Constructing the East River Tunnels of the Pennsylvania R. R. Entrance to New York City, with Some Data on Costs.—Eng.-Contg., Dec. 1, 1909, 4⅔ pp.

Construction of a series of articles describing construction of land and river tunnels across Manhattan Island and under the East River to a point inland on Long Island. This particular article describes methods of lining and summarizes the costs given in the series of articles.

Electric System of the Great Northern Railway at Cascade Tunnel.—By Cary T. Hutchinson. Ry. & Eng. Rev., Nov. 13, 1909. 3 pp., ill. Nov. 20, 1909, 4 pp.

This article is a digest of a paper read before

NOW READY

"Text Book on Graphic Statics"

By

C. W. MALCOLM.

Assoc. M. Am. Soc. C. E., Assistant Prof. Structural Engineering, University of Illinois.

CONTENTS:

PART I.

GENERAL PRINCIPLES.

CHAPTER I.—DEFINITIONS.
CHAPTER II.—CONCURRENT FORCES.
Art. 1. Composition of Concurrent Forces.
Art. 2. Resolution of Concurrent Forces.
Art. 3. Equilibrium of Concurrent Forces.
CHAPTER III.—NON-CONCURRENT FORCES.
Art. 1. Composition of Non-Concurrent Forces.
Art. 2. Resolution of Non-Concurrent Forces.
Art. 3. Equilibrium of Non-Concurrent Forces.
Art. 4. Special Constructions for Funicular Polygons.
CHAPTER IV.—MOMENTS.
Art. 1. Moments of Forces and Couples.
Art. 2. Graphic Moments.
CHAPTER V.—CENTER OF GRAVITY OF AREAS.
CHAPTER VI.—MOMENT OF INERTIA.
Art. 1. Moment of Inertia of Parallel Forces.
Art. 2. Moment of Inertia of Areas.

PART II.

FRAMED STRUCTURES—ROOF TRUSSES.

CHAPTER VII.—DEFINITIONS.
CHAPTER VIII.—LOADS.
Art. 1. Dead Load.
Art. 2. Snow Load.
Art. 3. Wind Load.
CHAPTER IX.—REACTIONS.
Art. 1. Reactions for Dead and Snow Loads.
Art. 2. Reactions for Wind Loads.
CHAPTER X.—STRESSES IN ROOF TRUSSES.
Art. 1. Definitions and General Methods for Determining Stresses.
Art. 2. Stresses by Algebraic Moments.
Art. 3. Stresses by Graphic Moments.
Art. 4. Stresses by Algebraic Resolution.
Art. 5. Stresses by Graphic Resolution.
CHAPTER XI.—WIND LOAD STRESSES.
Art. 1. Both Ends Fixed—Reactions Parallel.
Art. 2. Both Ends Fixed—Horizontal Components of Reactions Equal.
Art. 3. Leaward End of Truss on Rollers.
Art. 4. Windward End of Truss on Rollers.
CHAPTER XII.—STRESSES IN CANTILEVER AND UNSYMMETRICAL TRUSSES—MAXIMUM STRESSES.
Art. 1. Stresses in Cantilever and Unsymmetrical Trusses
Art. 2. —Maximum Stresses.
CHAPTER XIII.—COUNTERBRACING.
Art. 1. Definitions and Notation.
Art. 2. Stresses in Trusses with Counterbracing—Separate Stress Diagrams.
Art. 3. Stresses in Trusses with Counterbracing—Combined Stress Diagram
CHAPTER XIV.—THREE-HINGED ARCH.
CHAPTER XV.—STRESSES IN A TRANSVERSE BENT OF A BUILDING.
CHAPTER XVI.—MISCELLANEOUS PROBLEMS.

PART III.

BEAMS.

CHAPTER XVII.—BENDING MOMENTS, SHEARS, AND DEFLECTIONS IN BEAMS FOR FIXED LOADS.
Art. 1. Bending Moments and Shears in Cantilever, Simple, and Overhanging Beams.
Art. 2. Graphic Method for Determining Deflections in Beams.
Art. 3. Bending Moments, Shears, and Deflections in Restrained Beams.
CHAPTER XVIII.—MAXIMUM BENDING MOMENTS AND SHEARS IN BEAMS FOR MOVING LOADS.

PART IV.

BRIDGES.

CHAPTER XIX.—TYPES OF BRIDGE TRUSSES.
CHAPTER XX.—LOADS.
Art. 1. Dead Load.
Art. 2. Live Load.
Art. 3. Wind Load.
CHAPTER XXI.—STRESSES IN TRUSSES DUE TO UNIFORM LOADS.
Art. 1. Stresses in Warren Truss by Graphic Resolution.
Art. 2. Stresses in a Pratt Truss by Graphic Resolution.
Art. 3. Stresses by Graphic Moments and Shears.
Art. 4. Stresses in a Bowstring Truss—Triangular Web Bracing.
Art. 5. Stresses in a Parabolic Bowstring Truss.
Art. 6. Wind Load Stresses in Lateral Systems.
Art. 7. Stresses in Trusses with Parallel Chords by the Method of Coefficients.
CHAPTER XXII.—INFLUENCE DIAGRAMS AND POSITIONS OF ENGINE AND TRAIN LOADS FOR MAXIMUM MOMENTS, SHEARS, AND STRESSES.
CHAPTER XXIII.—MAXIMUM MOMENTS, SHEARS, AND STRESSES DUE TO ENGINE AND TRAIN LOADS.
Art. 1. Maximum Moments, Shears, and Stresses in Any Particular Girder or Truss.
Art. 2. Maximum Moments, Shears, and Stresses in Girders and Trusses of Various Types and Spans.

Cloth, 6x9 inches, 316 pages, 155 drawings, $3.00 net, postpaid.

The Myron C. Clark Publishing Company

13-21 Park Row, NEW YORK 355 Dearborn St., CHICAGO, ILL.

the Am. Inst. Elec. Engineers on Nov. 12, 1909, and describes in detail the work done in the electrification of a tunnel 13,873 ft. long in which gases from locomotives have made travel difficult and at times dangerous. Plans of yards are given with details of overhead construction and calculations given showing cost of operation. An 8-pp. illustrated abstract of the same paper was given in the Electrical Railway Journal, Nov. 20, 1909.

BRIDGES, BUILDINGS AND FOUNDATIONS.

The Fabrication of Heavy Curved Drawbridge Girders.—Eng. Rec., Dec. 18, 1909, 2 pp.

Describes the construction of curved girders for a bascule bridge in Chicago. The shop problems involved are quite different from those in plain steel work.

Bridge Inspection Disclosures. Eng. Re Dec. 11, 1909, 2 pp.

Describes methods adopted by Mr. Herbert C. Keith of New York in examining bridges and similar structures. Gives also results of his observations in the inspection of over 2,000 bridges and viaducts, with suggestions as to details.

Steel Erection Work.—Eng. Rec., Dec. 4, 1909, 1⅓ pp.

Two articles, one describing some rapid erection work in connection with placing plate girder spans for a viaduct in Jersey City. Each girder weighed nearly 30 tons and they varied in length from 60 to 73 ft. It took 48 hours to erect eight spans. The other article describes the putting in place of 12 large steel gates in the new dam of the Southern Wisconsin Power Co. Each gate is 8 ft. high, 25 ft. 10 ins. long and weighs approximately 7 tons. Contractor's methods in both cases are described and half-tone illustrations are given.

Suspension Bridge of 600 ft. Span Across the Culebra Cut of the Panama Canal.—By A. S. Zinn. Eng. News, Dec. 16, 1909, 3 pp.

On account of track shifting and other construction operations it was found necessary to frequently cut and change the compressed air and water pipe lines at the Culebra cut. It was estimated that in the next five years the cost of this cutting and changing would be about $60,000. A suspension bridge 600 ft. long to carry the pipes for the rest of the time the work will be going on was constructed at a cost of $22,000 and is wide enough to be used for highway purposes also. The drawings of the bridge and details and the description given of the work will be of assistance to men confronted with a similar problem.

The Construction of a Four-Track Truss Bridge with Solid Floor; Chicago and Oak Park Elevated Ry.—Eng. News, Dec. 9, 1909, 3½ pp.

This is a description of interest to structural engineers of a four track solid-floor truss bridge built to carry the Chicago & Oak Park Elevated Ry., over the ten track bridge carrying the Chicago & Northwestern Ry. Terminal approach across Lake St. The details are very fully illustrated and drawings of the falsework are shown.

The Construction and Equipment of a Modern Boiler-Making Plant.—By E. R. Fish. Eng. News, Dec. 16, 1909, 3 pp.

Abstract of a paper read before a joint meeting of the American Society of Mechanical Engineers and the St. Louis Engineers' Club. A general plan is shown, together with a general view of the plant after completion. A suggestive paper for mill building engineers.

Construction of the Lethbridge Viaduct, Crows Nest Branch, Canadian Pacific Railway Company.—Eng.-Contg., Dec. 29, 1909, 6½ pp.

Describes location and purpose of viaduct, its main structural features, and, in particular, the methods and machines employed in the erection. A special steel traveler was used which is fully described and illustrated.

A Comparison of Reports on Tests on the Same Cement by Various Laboratories.—By Alexis Saurbrey. Eng. News, Dec. 9, 1909, 1½ pp.

Mr. Richard K. Meade a few months ago suggested that cement be purchased on the result of tests. That is a cement that showed better results than another should be worth the best price. This article describes the result of a series of experiments made to determine the value of check tests. The results are given in detail and serve to show that the personal equation is such an important item that independent testers often vary widely in testing the same samples. The author calls it "annoying."

CONCRETE AND REINFORCED CONCRETE

The Reinforced Concrete Municipal Pier, Santa Monica, Cal.—By Edwin Hall Warner, M. Am. Soc. C. E. Eng. News, Dec. 9, 1909, 1½ pp.

This pier is 1600 ft. long, 36 ft. wide and cost $100,000. It was built to carry an outfall sewer pipe to deep water and is utilized for revenue producing as a municipal income producer. The piles are of reinforced concrete as well as the rest of the wharf and full details are given.

Austrian Tests of Cement Mortar in Sea Water and Salts.—Eng. News, Dec. 9, 1909, 1 p.

A progress report to the Society of Austrian Engineers and Architects on tests commenced in 1907 is here abstracted. This article is merely of interest to those who are studying the matter, as a guide to possible sources of information.

A Comparison of the Cost of Two Methods of Concrete Construction; Separately Molded Members vs. Monolithic Structure.—By Mason D. Pratt. Eng. News, Dec. 9, 1909, 2 pp.

Cost of Two Methods of Concrete Construction.—By Mason D. Pratt. Eng. Rec., Dec. 11, 1909, 2 pp. ill.

A very interesting description of the erection of two car barns each 75 ft. wide and 360 ft. long. One was cast and the other made of shop fabricated members. This shop fabricated barn was built at a cost of about 15 per cent less than the monolithic building. The costs are itemized and the most important details illustrated.

The Delaware River Concrete Bridge, Slateford-Hopatcong Cut-Off; Delaware, Lackawanna & Western R. R.—Eng. News, Dec. 30, 1909, 4 pp.

This bridge is a multiple arch concrete bridge 1,452 ft. long with a width between parapets of 28 ft. carrying a double track standard gage railway. It contains 51,500 cu. yds. of concrete. A feature of the construction work is the steel centering used, which is fully described. The article is illustrated with a number of details and half-tones.

Reinforced Concrete Siphon in Spain.—By B. A. Etcheverry. Calif. Journ. Tech., December, 1909, 4 pp.

Describes a siphon recently completed in Spain. The diameter is 1312 ft. and the maximum head of water is 97 ft. It is 2363 ft. long and has no expansion joints. The seepage is 1/24 the estimated amount.

Cement and Sand for Concrete.—Jour. Assoc. Eng. Soc., November, 1909, 28 pp.

An informal discussion at a meeting of the Boston Society of Civil Engineers in which proper qualities of cement and sand were discussed by prominent engineers.

The Use of Cold Twisted Steel Bars.—By Jesse J. Shurman. Conc. Eng., December, 1909, 2 pp.

The author is inspecting engineer for Jones & Laughlin Steel Co. Having no particular interest in any form of steel reinforcement, he discusses from the standpoint of a steel maker

FINANCING AN ENTERPRISE
By FRANCIS COOPER

TWO volumes that have helped thousands of men win fortunes by showing them how to successfully finance and promote their business or their discoveries. Highly endorsed. Only successful work on promotion.

VOL. 1 describes conditions necessary for successful financing; how to investigate, protect and capitalize an enterprise; experimental work and model making.

VOL. 2 tells best methods for securing money, privately, or publicly, by advertising; how to advertise; how to write a winning prospectus. Important chapters on stock, bonds, incorporation, etc., etc.

Invaluable knowledge gathered from fifteen years' experience. Save you hundred times its cost. Full descriptive circular if you want it.

700 pp. 12 mo. Buckram binding. Two vols., $5.00 prepaid. Either vol. separately, $2.50 prepaid.

THE RONALD PRESS CO., Rooms 30-36, 229 Broadway, New York

CONTRACTORS AND ENGINEERS

SAVE LABOR — SAVE TIME

USE
Nash's Expeditious Measurer

A book of 200 pages of indexed tables, showing at a glance the cubic contents of any stone or package according to its length, breadth and depth. Used by Contractors, Quarrymen and Engineers everywhere. Order of your bookseller or from the publisher. **$2.00 Postpaid.**

Engineering Work In Towns and Cities

By ERNEST McCULLOUGH, C. E.

THERE are many special treatises on paving, water-works, sewerage, concrete, etc., but this is the only book that deals with all of these subjects in the connected manner in which they come before the City Engineer.

It is invaluable to any person who wishes to learn the best methods and practices in the planning and carrying out of public work.

Cloth, 6x9 inches; 510 pages; 69 tables; 128 diagrams and illustrations; price $3.00 net, postpaid

the theoretical objections brought against cold twisted steel bars. His paper will help settle a vexed question.

A Method of Constructing Reinforced Concrete Cylindrical Storage Bins.—Eng. News, Dec. 2, 1909. ⅔ p.

In this device steel rods are placed vertically about 8 ft. apart in the concrete and jacking levers with friction collars attached to them. By means of these levers the forms are lifted as fast as the concrete sets sufficiently, thus making the concreting a practically continuous process.

Design and Construction of Forms for Concrete Work.—Eng.-Contg., Dec. 1, 1909. 1¼ pp.

Conclusion of a series of articles on practical form construction, giving tables and formulas for computation, rules, examples and illustrations showing practice.

Details of Concrete Encasement for Elevated Railway Structure and of Special Forms Employed in its Construction.—Eng.-Contg., Dec. 15, 1909. 1¾ pp.

Describes construction of concrete encasement for 372 ft. of double track elevated railway and gives details of form construction and of methods of handling forms.

A Comparison of Timber and Concrete Piling on the Basis of Cost.—Eng.-Contg., Dec. 5, 1909. ¾ p.

Discusses comparative costs of wood and concrete piles on the basis of bearing power, permanency and time of construction.

Some Notes on Concrete Materials and Proportions.—Eng.-Contg., Dec. 15, 1909. 1½ pp.

A review of the various methods prepared for determining amounts of materials and of water required for concrete, giving rules and formulas and examples of their use.

Plain Account of the Characteristics Required of Cement, Sand and Stone for Concrete.—Eng.-Contg., Dec. 1, 1909. 2 pp.

A clear and simple statement of the characteristics which cement, sand and stone should possess for making concrete. An excellent article for the small concrete worker, the contractors' foreman and others not possessed of the more special technical knowledge of concrete materials, etc.

Building Concrete Piles With Enlarged Bases for Postoffice Building Foundations at Paris, Ill.—Eng.-Contg., Dec. 29, 1909. ⅔ p.

Describes a new method of molding concrete piles in place with enlarged basis and gives some records of work on a 211-pile foundation.

Design for a Concrete and Pile Quay Wall With Reinforced Concrete Sheet Pile Facing.—Eng.-Contg., Dec. 22, 1909. 7 pp.

Gives section of quay wall and details of sheet piling with specifications for molding and sinking sheet piles.

Methods and Cost of Constructing Concrete Sewers at Richmond, Ind. By Fred R. Charles. Eng.-Contg., Dec. 29, 1909. 2 pp.

Covers experience with half-a-dozen different forms of concrete sewer construction, giving methods, results and costs. A very valuable article for city engineers.

Some Retaining Wall Construction in Connection With the Chicago & Northwestern Ry. Track Elevation Work in Chicago.—Eng.-Contg., Dec. 29, 1909. 1¼ pp.

Describes retaining wall structure and illustrates forms, describes methods of work with a special concrete mixer elevating concrete directly into forms.

Methods Employed in Constructing a Reinforced Concrete Building for the Carter's Ink Company.—Eng.-Contg., Dec. 22, 1909. 1 p.

Describes a special excavator consisting of a dipper mounted on a pile driver frame and also method of handling concrete, with general details of construction methods.

New Design for Reinforced Concrete Slab Floors Which Can be Mathematically Analyzed.—Eng.-Contg., Dec. 22, 1909. 2 pp.

Describes a floor construction of reinforced concrete in which very flat wide beams or slabs take the place of the ordinary deeper and narrower beams, thus giving a flat ceiling and saving in height of stories, and also giving a construction which can be analyzed by ordinary methods.

NOW READY

Cost Keeping and Management Engineering

By HALBERT P. GILLETTE and RICHARD T. DANA

This is the first book ever published on the subject of cost keeping on contract work. Its authors are pioneers in the field, and, although they have written much that has appeared in the form of articles—particularly in the pages of *Engineering-Contracting*—this book is the first presentation on the subject in a complete and logical sequence.

In the opening chapter the authors endeavor to reduce the **management of men** to a science, by laying down **ten fundamental laws of management,** each of which is fully discussed.

The second chapter contains 17 **fundamental rules for securing minimum cost.** These two chapters are wholly novel and of far reaching importance to all men who are, or hope to be, in charge of other men.

The authors then proceed to describe and illustrate their own systems of cost keeping, which they have developed on their own contract work and have also been installed on the work of other contractors, giving both the **punch card reports**—a form of report which they were the first to devise and the more common blanks to be filled in with pencil.

The last chapter contains numerous systems of cost keeping developed by other engineers and contractors, and is a **veritable mine of suggestive hints** as well as of examples of excellent blanks for special purposes.

The following is the list of chapters:

CHAPTER I—The Ten Laws of Management.
CHAPTER II—Rules for Securing Minimum Cost.
CHAPTER III—Piece Rate, Bonus and Other Systems of Payment.
CHAPTER IV—Measuring the Output of Workmen.
CHAPTER V—Cost Keeping.
CHAPTER VI—Office Appliances and Methods.
CHAPTER VII—Bookkeeping for Small Contractors.
CHAPTER VIII—Miscellaneous Cost Report Blanks and Systems of Cost Keeping.

Cloth, 6x9 inches, 360 pages. Price $3.50 net, postpaid.

SPECIAL OFFER—"Cost Keeping and Management Engineering" and One Year's Subscription to Engineering-Contracting—$5.00.

The Myron C. Clark Publishing Co.

13-21 Park Row, New York 355 Dearborn Street, Chicago

EARTH AND ROCK EXCAVATION.

A Large Blast at Morena Dam, California.—By M. M. O'Shaughnessy. Eng. News, Dec. 30, 1909. 1 p.

Describes a blast made in California that used 19,475 tons of powder, cost $9,093.95 and displaced 180,000 tons of granite. Describes method of doing the work.

A Drilling Auger for Prospecting for Coal Above Water Level.—By Baird Halberstadt. Eng. News, Dec. 16, 1909. 1 p.

Describes an auger for prospecting purposes that should be of service to contractors generally. The author prospected 75,000 acres of coal lands with such an outfit and claims it to be better than prospecting by trenching and shafting.

Some Methods and Costs of Work in Constructing the Gatum Dam for the Panama Canal.—Eng.-Contg., Dec. 15, 1909. 1 p.

Shows cross-section of dam, describes methods of construction and gives costs based on official figures of dry filling and wet filling.

A Novel Locomotive Drill and a Remarkable Drilling Record.—By Frank Richards. Eng. News, Dec. 2, 1909. 1 p., ill.

This drill has a vertical guide permitting a travel of 10 ft. instead of 2 ft. to 2½ ft. as in the drill mounted on tripod. Holes can be drilled without changing steel so considerable time is saved in changing drilling holes. Being mounted on wheels, time is saved in changing from hole to hole. Operated by two men, it does as much work as four tripod drills with eight men.

The Cost of Producing Crushed Stone in Boston, Mass., by City Operated Crushing Plants.—Eng.-Contg., Dec. 29, 1909. 3⅓ pp.

Describes equipment and conditions of work at eight city crushing plants and gives itemized unit costs of crushed stone at each plant for three years, 1905-6-7. The records are discussed and criticized and comparisons made with market prices of crushed stone.

Some Methods and Costs of Removing Stumps in Clearing Land.—Eng.-Contg., Dec. 22, 1909. ¾ p.

Describes methods of stump removal by burning, blasting, pulling, etc., and gives some general costs.

SURVEYING AND DRAFTING.

A Convenient Rack for Holding Drawings.—By John H. Gregory. Eng. Rec., Dec. 25, 1909. 1½ pp.

The method described for keeping drawings is to place them in wooden strips like loose leaf binders with the ends projecting and a rack is made on which these ends rest so the drawings hang vertically at all times. Mounted on castors so it can be wheeled around the office.

Requirements of Engineering Files and Indexes.—By Herman K. Higgins. Eng. News, Dec. 30, 1909. 2 pp.

This is a very good article giving many useful facts about the filing and indexing of printed matter, maps, field notes, etc., in engineering office. Condensed from a paper read before the Boston Society of Civil Engineers.

Filing and Indexing System of the Board of Water Supply of New York City.—By Alfred D. Flinn. Jour. Assoc. Eng. Soc., October, 1909. 33 pp.

This article is extremely detailed and prepared with care. A number of offices are maintained on the various works and a chart of the system of accountability is given. The author of the paper is the Headquarters Department Engineer.

Separate Leaf System for Recording Survey Notes.—By Lee Fraser. Eng. & Min. Jl., Dec. 25, 1909. 2 pp., ill.

Describes method used by a mining company and gives blank forms used. Cards 5x8 ins. ruled for transit, level and topography respectively are taken on the job in loose leaf binders and each day's cards are turned into the office where specially ruled loose leaves are used to transfer notes to.

Cost of Subdividing a Forty-Acre Tract Into Building Lots With a Transitman and Two Assistants.—Eng.-Contg., Dec. 15, 1909. ¼ p.

Describes conditions and methods of making survey and gives time costs of the work.

MISCELLANEOUS.

Cost of Power for Various Industries.—Eng. Rec., Dec. 25, 1909. 1 p.

Abstract of paper read by Mr. Charles T. Main before the Boston Society of Civil Engineers, giving cost of power for manufacturing plants using steam, electricity and water power.

Regulation of Compressed Air Work in France.—Eng. Rec., Dec. 4, 1909. ⅔ p.

This article gives the code of rules under which all work must be done in France where air pressure is used, to obviate the danger of bends, or other mishaps resulting from working under air pressure.

Cooling Towers for Steam and Gas Power Plants.—By J. R. Bibbins. Eng. News, Dec. 16. 1909. 5¾ pp.

This is an abstract of a paper read before a meeting of the American Society of Mechanical Engineers. The cooling tower is no longer regarded as a makeshift but is becoming an integral part of all power plants. The literature is very small and this paper goes so fully into the matter as to be very helpful in studying such power plant auxiliaries.

Refuse Disposal and the New Refuse Incineration Plant for Milwaukee.—By Samuel A. Greeley. Jour. Assn. Eng. Soc., November, 1909. 14 pp.

Gives general data on analysis of waste, rubbish and garbage in cities and follows with a description of the new plant at Milwaukee, having a daily capacity of 300 tons and costing $200,000.

A Municipal Purchasing Department.—Mun. Jour. & Eng., Dec. 22, 1909. 2½ pp.

A comprehensive description of the purchasing organization in the city of Cleveland, O.

Going Value as an Element in the Appraisal of Public Utility Properties.—By Wm. H. Bryan. Jour. Assoc. Eng. Soc., October, 1909. 13 pp.

A discussion of a paper by John W. Alvord before the 1909 Convention of the Am. W. W. Assoc. and presenting ideas on the subject held by the Wisconsin Public Utilities Commission.

What Does Your Power Cost You?—Can. Mfr., Dec. 10, 1909. 4 pp.

An article giving cost of horsepower by steam, gas, oil and gasoline engines and electricity. Tables and diagrams are given, compiled and prepared by the Ontario Hydro-Electric Power Commission.

The Design of Smelter Flues.—By F. A. Lee, M. E., Min. Sci., Dec. 16, 1909. 3 pp.

Flues are used to conduct gases from furnaces to stack and also to catch dust and facilitate condensation of fumes. Temperature variations are so great that the proper design is a nice little problem. This article describes principles of design used on a system in use in Colorado for two years past with satisfaction.

Center Walks Supplemented by Back Alleys in Place of Roadways and Sidewalks in Venice, Calif.—By H. M. Meinell. Eng. News, Dec. 2, 1909. ⅔ p.

Describes an effective method of improvement in a small seaside town. Wagons are restricted to streets parallel with the shore and to the alleys crossing them. The cross streets are improved by placing a concrete walk down the center, extending the yard walks to this walk and sodding the rest of the street, thus creating a beautiful park effect.

Costs of Various Kinds of Municipal and Sanitary Work at Panama.—Eng.-Contg., Dec. 15, 1909. 1½ pp.

Gives costs taken from the report of the Isthmian Canal Commission of constructing pipe sewers, water mains, reinforced concrete reservoir, pumping and filtering water, crushed stone and street extension.

Science of Management Engineering.—By Hulbert P. Gillette. Eng.-Contg., Dec. 15, 1909. 1⅔ pp.

An argument to show that management engineering is susceptible of reduction to scietific laws, and thus warrants being called a science. Certain of these laws are stated and demonstrated.

Oil and Gasoline Engines for Contractors' Use.—Eng.-Contg., Dec. 8, 15, 22 and 29, 1909. 3⅓ pp.

A series of articles describing the operation and care of gasoline engines and some of the uses to which they are put by contractors. The

The Journal OF Western Society OF Engineers

is a high grade bi-monthly illustrated magazine of about one hundred pages in each number, and contains the original papers of engineering interest that have been presented to the society, with the discussion of the same. These papers treat of subjects in all lines of engineering, are well illustrated and should be of value to engineers, chemists, scientific and business men everywhere.

The Subscription Price is $3.00 a Year

The circulation is about 1,600 copies of each issue, six times a year.

The JOURNAL is a valuable advertising medium, as it goes all over the world and to a high class of technical readers. Advertisements, if of interest to engineers, may be published in the JOURNAL.

For rates or other information concerning the JOURNAL of the Western Society of Engineers address or call upon the Secretary, 1735 Monadnock Block, Chicago.

The October Number Contains

"Clay Products"

By A. V. BLEININGER,
Ceramic Chemist with the Clay Products Section of the U. S. Geological Survey.

An extensive paper on the work of the Section, giving results of tests on clay products used in construction work.

"Contracts for Structural Steel Work"

An extensive discussion by Attorneys, Architects, Engineers and Contract Managers, covering "Liabilities;" "Penalties," "Damages," "Arbitration," "Relations of Parties in a Contract," and "Payments." Forms of Contracts of unusual merit are given.

"Possibilities of Commercial Automobiles"

By W. W. MACFARREN,
Mechanical Engineer.

An illustrated paper with discussion covering commercial problems of transportation with data on costs per ton-mile, mechanical considerations, etc.

Proceedings
The Engineers' Society of Western Pennsylvania

50 cents per copy. $5 per year

ELMER K. HILES, Secretary,
803 Fulton Building, PITTSBURGH

data given regarding gas engine troubles and remedies are particularly useful.

Cost of Hauling With Traction Engines and Dump Wagons as Compared With Hauling With Horses.—Eng.-Contg., Dec. 8, 1909. 4⅓ pp.

Gives a general discussion of general conditions, field conditions, items of contractor's cost, general description of work observed and full methods and cost analysis of several pieces of work, followed by general formulas and diagrams.

First Cost and Cost of Shop Repairs of Steam Shovels, Cars and Locomotives on the Panama Canal.—Eng.-Contg., Dec. 22, 1909. 2⅔ p.

Gives detailed costs compiled from data contained in the report of the Isthmian Canal Commission.

BOOK REVIEWS.

Inspector's Handbook of Reinforced Concrete.—By Walter F. Ballinger and Emile G. Perrot. New York. Engineering News Publishing Co. Cloth 4½x7 ins. 66 pp.; 6 folding plates; $1.

This book is divided into three chapters, dealing respectively with Forms or Falsework; Reinforcement; Concrete. An appendix contains a few data on design with formulas, followed by some plates for obtaining data on strength of beams and slabs graphically. The only thing about the book to entitle it to be designated as an inspector's hand book is the title. The matter in the book is very general and such as may be found in practically every issue of periodicals devoted to concrete in a popular way. An inspector is a man placed on a piece of work to see that the specifications are complied with. A hand book for such a man must be more than a general talk on the subject and must be something less than a book on design. It should be a book dealing with the many points over which a discussion may arise and illustrating good and poor practice when such illustrations will help. It should be confined strictly to the one subject of construction. Questions of design are supposed to have been attended to before the contract is signed, therefore in such a book no formulas or designing diagrams are required.

On the subject of inspection this book is so lamentably deficient that it cannot be recommended to those who are looking for an inspector's hand book. It is hard to place it except to say that it adds a certain number of pages to an already crowded bibliography on reinforced concrete. As a book the matter is out of place but it might not be out of place in the pages of a techno-popular magazine.

Concrete Bridges and Culverts for both Railroads and Highways.—By H. Grattan Tyrrell, C. E. Chicago and New York. The Myron C. Clark Publishing Co. London, E. & F. N. Spon, Ltd. Leather 4½x7 ins. 251 pp. 66 illustrations and 10 tables in the text. $3.

The first part of this work is a complete treatise on plain concrete arches, giving examples in design and construction and methods of cost estimating. Many illustrations are given to make the text plain. A 4-page table gives a list of 56 plain concrete bridges constructed in many countries, the spans varying from 20 ft. to 365 ft. The costs are given for 18 and the designers names for 31, of these bridges. The data cover number of spans, span length, rise, width, total length, total height and form of curve. For some reason the [illegible] is not given in any case but this deficiency is of course taken care of in the preceding pages on design.

Part II, Reinforced Concrete Arch Bridges has a 6-page table similarly describing 122 bridges of this type in which no necessary item is lacking, there being in addition columns giving amount of reinforcement in the arch, the spans varying from 33 to 197 ft. On the subject of design this section is not so satisfying as the section on plain arches, and the designer needs some such work as Reuterdahl to supplement the information given by Mr. Tyrrell. Several pages devoted to estimating costs are exceedingly good. On page 158 is a table of highway arches for clear spans varying from 20 ft. to 150 ft., having a roadway 16 ft. wide. The table gives the crown thickness, rise, area of reinforcement, cu. yds. concrete in arches and approximate amount of concrete in the abutments.

Part III discusses Highway Beam Bridges of Reinforced Concrete and two tables are given containing dimensions of such bridges up to spans of 40 ft., with estimates of cost.

Part IV treats of Reinforced Concrete Culverts and Trestles with estimates of cost and rules for estimating. An 8-page table gives complete data for railroad box culverts to go through embankments from 10 ft. to 50 ft. high, having openings from 2 ft. to 20 ft. wide; with estimates of cost.

Trestles with spans from 14 ft. to 24 ft. are detailed with piers from 6 ft. to 24 ft. in height for single track railways, thus making the work of the designer very light. Cost estimates are also given.

The book shows evidence of a great deal of work on the part of the author and will be of service to a large class of men that likes to possess standard plans for structures. That it was written by a designer is shown in the calm assumption by the author that his readers do not require much, if any, instruction in reinforced concrete design. It is also shown by the ignoring of all construction problems and difficulties; and absence of information on the vital subject of forms and centering. In its present shape there are many men to whom it will be useful, especially because of the tables and estimating data. City engineers, county surveyors and road commissioners will appreciate it.

Modern Lettering: Artistic and Practical.—By William Heyny. New York. William T. Comstock. Cloth 7x10 ins. 156 pp. 35 plates. $2.00.

The author says that this book gives a course for artists, architects, sign writers and decorators; also the construction of pen and ink designs for commercial uses, advertisements, letter heads, business cards, memorials, resolutions, etc.

The eye is so often offended by examples of bad taste shown in lettering, as well as by poor execution of the work that a book like this should be of considerable value to the men whom the authors had in mind. Twenty years ago it could have been recommended to engineers. Today, however, engineers have a distinctive "commercial" system of lettering and this book can be of little interest to them.

While there is nothing in the book to commend it to engineers, every architect should have a copy. The author is entitled to praise for his careful and good work in the preparation of such a good text book.

Domestic Sanitary Engineering and Plumbing.—Dealing with Domestic Water Supplies, Pump and Hydraulic Ram Work, Hydraulics, Sanitary Work, Heating by Low Pressure, Hot Water, and External Plumbing Work. By F. W. Raynes, R. P. New York and London. Longmans, Green & Co. Cloth. 6x9 ins. 474 pp. 277 illustrations and 29 tables in the text. $3.

As a text book on the subjects mentioned in the title page this book is very good. In the sections dealing with hydraulic calculations a number of examples are worked out in detail. There is a good chapter on the disposal and treatment of sewage from country houses and one on water supply. Pressure tank systems of water supply, now used generally in the United States are not mentioned. The tone of the book is intensely practical. The fact that it deals entirely with English methods will limit the sale in this country although it can be read and studied with profit by plumbers, architects and engineers in charge of sanitary work in small and medium size cities. It is an especially good book for architects.

Stresses in Masonry.—By Herbert Chatley, Professor of Civil Engineering, Tong Shaw Engineering College, North China. Philadelphia, J. B. Lippincott Co. Cloth. 5x7½ ins. 146 pp. Illustrated. $1.25.

This is a good little book. The author in the beginning states that he does not know of a brief, yet comprehensive, treatise on the stresses in masonry, although elementary treatises on steel work are numerous.

There are ten chapters as follows: Strength of Stone Walls; Columns and Piers; Brackets and Cantilevers; Simple Arches; Vaults and Skew Arches; Domes; Retaining Walls and Dams; Artificial Stone and Concrete; Reinforced Concrete. There is a very good index.

The mathematical treatment is simple, no equations higher than quadratics being used. The author begins by showing how large a part shear plays in masonry failures and tells how to design safely when plain masonry is used in structures. Tensional stresses are considered and means shown for avoiding them. This naturally leads to reinforced concrete, of which a brief treatment is given. Methods for finding the pressure line in plain arches are given. In the chapter on reinforced concrete there is the following about the arch:

> In the case of arches and dams we proceed, as in masonry, to find the position of the resultant through the mass and compute the bending moment about the center of the section by multiplying the normal component of that resultant into the distance between it and the center of the section. There is no longer any need to restrain this resultant to the middle third, although, of course, the moment will increase rapidly as the resultant becomes more remote. It is usual to reinforce the wall or arch with rods on both sides to take the bending.

Then the usual formula for resisting moment in a reinforced concrete beam is given; a simple method of disposing of the problem and hardly as full as is necessary.

The reinforced concrete section cannot be commended, as the treatment and formulas lack the simplicity of present American methods and the ratio of deformation is taken as equal to 10 instead of 15, which is now generally used. This chapter might well have been omitted but its shortcomings do not detract from the value of the earlier chapters on plain masonry.

Squares and Logarithms.—By G. D. Inskip. Chicago and New York. The Myron C. Clark Publishing Company. Leather. 5x7½ ins. 546 pp. $3.

This is a new, revised and enlarged edition of a well known book. It contains squares and logarithms for lengths from 1 ft. to 100 ft., advancing by 32nds of an inch; Logs. of numbers from 0 to 10,000; Logarithmic Trigonometrical Functions for every minute of the quadrant and auxiliary functions for the calculation of the logarithms of trigonometrical functions from 0 to 3,600 seconds, etc.; Natural functions; Decimals of a foot; Decimals of an inch; Weights and areas of round rods and square bars of steel. Directions for use of tables are given, making this a serviceable and well-nigh indispensable book for structural detailers.

The Elements of Machine Design.—Part I, General Principles: Strength of Materials, Rivets, Bolts, and Other Fastenings; Journals and Shafting; Couplings; Pedestals; Transmission of Power by Gearing, Belting, Ropes and Chains. New edition, Revised and Enlarged. By W. Cawthorne Unwin, LL. D., F. R. S., M. Inst. C. E., etc. New York and London, Longmans Green & Co. Cloth. 6x9 ins. 531 pp. 387 illustrations and many tables in the text. $2.50.

In 1877 Prof. Unwin issued the first edition of this work and the reviewer (eight or nine years later) had it as a text book. In 1890 a new, larger edition appeared and it was again increased in size in 1901. In the second and third editions Steam Engine Design was placed in a separate volume and the work has been one of the standards of good practice to date. The volume under review (1909 edition) has been entirely rewritten and is substantially a new book thoroughly up to date on the subjects mentioned in the comprehensive sub-titles. It is a book for the drafting room and the practical designer as well as for the class room. It occupies a distinct field between works on applied mechanics and empirical books of rules and collections of examples of machine details. Part II will deal with engines.

Science of Organization and Business Development.—A Treatise on the Law and Science of the Promotion, Organization, Reorganization and Management of Business Corporations; with Special Reference to Approved Plans and Procedure for the Financing of Modern Business Enterprises. By Robert J. Frank, LL. B., of the Chicago Bar. Revised Edition, 1909. Chicago. The Chicago Commercial Publishing Co. Leather. 5½x8 ins. 278 pp. $2.75.

In a book such as this many questions, often considered elementary, are discussed. This is unavoidable from the nature of things for the book is sure to fall into the hands of those who need such information.

After a careful reading the reviewer feels that this is a book of considerable value to men interested in the matters mentioned in the lengthy title. There is a section on the Promotion of Enterprises that should interest engineers who often see opportunities to exploit enterprises without enough knowledge of business methods to save themselves. An Appendix of 74 pages gives legal forms to use in transacting corporate business.

The book is not of the "Every Man His Own Lawyer" class, but is a treatise on business organization and development for business men.

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week. The Board of Water Supply of New York city has just awarded one of the largest single contracts yet let in connection with the new Catskill water supply system for the city. This contract was for the construction of the Kenisco Dam and appurtenant works, and was let to Rodgers & Hagerty, New York city, at $7,953,050. The work includes over 1,330,000 cu. yds. of excavation, 37,500 cu. yds. mass concrete, and 900,000 cu. yds. of cyclopean masonry.——Contracts for four large state ditches have just been let by the State Drainage Board of Minnesota, John Kohler, Frazee, Minn., secured two of the ditches totaling 1,277,721 cu. yds. of floating dredge work; Forrestal & Feveu, St. Paul, Minn., secured 687,938 cu. yds. dredge work, and the Standard Drainage Co., Windom, Minn., secured 301,217 cu. yds. of floating dredge work.——Among the large railroad contracts let the past week are the following: Smith & Campion, Mahanoy City, Pa., for constructing a third track on the Lebanon Valley Branch on the P. & R. Ry. between Prescott and Myerstown, Pa.; D. Fitzgerald, Pendleton, Ore., for constructing the 52 mile traction line of the Washington Oregon Traction Co., in Oregon; Eyre-Shoemaker, Inc., Philadelphia, Pa., for double tracking the New York, Philadelphia & Norfolk R. R. for a distance of 50 miles; The Grigsby Construction Co., Houston, Tex., for extending the Southwestern Ry. from Scotland, Tex., a distance of ten miles; J. H. McFarlin & Co., Jacksonville, Ill., for constructing the Springfield-Jacksonville interurban line between the two cities named, the contract including 400,000 cu. yds. earth excavation and 40,000 cu. yds. concrete masonry; C. C. Tate, Bogalusa, La., for laying 12 miles of track and constructing 1,000 lin. ft. pile trestle for the extension of the Lakeview Traction Co. of Memphis, Tenn.; The Northwestern Construction Co., Milwaukee, Wis., for building a 62 mile interurban line from Sterling to Rock Island, Ill., the contract amounting to $1,240,000.——The Alberta & Great Waterways Ry., of Edmonton, Alberta, has let contracts for ties, bridge timbers, and culvert timbers for the first 150 miles of its line, and it is believed that grading contracts for this first section have been or are just about to be let. ——A proposition to issue $175,000,000 of refunding bonds will be voted on Jan. 18 by the stockholders of the Missouri Pacific. Of this amount it is proposed to set aside the sum of $52,866,000 for betterments, additions and equipment.——The receiver for the Ocean Shore Ry. is seeking to issue $3,500,000 of receiver's certificates for completing the line between San Francisco and Santa Cruz.——An $18,000,000 company has been organized in Michigan to take over a number of power and gas plants in the state. The company will be known as the Commonwealth Power, Railway & Light Co., and is planning large hydroelectric developments on the AuSable River in Michigan.—A New York syndicate is negotiating for the control of a large number of electric plants and railway systems in Central Pennsylvania, and proposes to operate them as one system, the power to be obtained from a plant being erected near Hazelton and from dams at Muncy, Pa.—The New York State Canal Board has approved plans for four additional barge canal contracts which will cost about $3,000,000.—Two large irrigation projects have been financed by Denver capitalists. One of these is a project for reclaiming 60,000 acres near Hayden, at a cost of $500,000. The Bear River Irrigation & Construction Co. is back of this project. The other project has been promoted by Lafayette Hughes, of Denver, and proposes the construction of systems to cost about $4,000,000.

Standard Gage and Other Gages. For many years the standard gage of American railroads has been 4 ft. 8½ ins. In the early days of railroad building in this country, however, there were about as many different gages as there were railroads. The first railroads built in England were made the same width as the tram roads, on which ran ordinary wagons. This width happened to be 4 ft. 8½ in., and the railroads adopted this width for the convenience of using upon them the same cars. The American railroads, using at first English engines, were necessarily built with the 4 ft. 8½ in. gage. This gage was generally adopted in the New England states and in New York, but in the other states there was much confusion of gages. In New Jersey and Ohio the gage was 4 ft. 10 ins. In Virginia, East Tennessee and north of Georgia the gage was 5 ft. In Maine the Atlantic & St. Lawrence R. R. had a gage of 5½ ft., and this gage was also in use in Canada by general law. Missouri also adopted this gage by a law enacted in 1835. The gage of the Erie R. R. and connecting roads was 6 ft. In Pennsylvania alone there were at least seven different widths of tracks. The Chicago & Northwestern Ry. (then the Galena & Chicago Union) started out with a 6 ft. gage, but after 40 miles of track had been constructed, changed its name, and had the track relaid in standard width. Some of the leading railroads which were constructed originally with other than the standard gage were the Missouri Pacific with a 5½ ft. gage; the Chesapeake & Ohio, 5 ft.; the Pennsylvania, 4 ft. 9 ins.; the Lake Shore & Michigan Southern, 4t ft. 9½ ins. The promoter of the first railroad to the Pacific proposed to construct a road with a gage of 6 ft., and a competitor not to be overdone offered to build a track with a gage of 8 or even 10 ft. upon which he should run cars 200 ft. in length. In England Brunel introduced a gage of 7 ft. on the Great Western Ry., but the majority of the English roads were standard gage. In 1846 there were 1,901 miles of 4 ft. 8½ in. track and 274 miles of other gages. Naturally when these railroads met at junctions it was necessary for the passengers, baggage and freight to be changed from one set of cars to another. To do away with these inconveniences, a number of remedies were put in use. One of these was to have the axles of the cars so arranged that one portion telescopes into the other, so that the distance between the wheels could be adjusted to any gage. To lessen the gage, a catch was loosened and the car pushed along a pair of rails, the space between which gradually narrowed from 7 ft. to 4 ft. 8½ ins., and thus the wheels were forced closer together. Some roads had their cars built so that the car bodies could be swung by powerful cranes from one set of trucks to another. Other railroads had movable boxes for merchandise made of such a size that one could be carried on a standard gage track and two on a broader gage track. Other railroads laid an extra rail so that the same road could be used for both classes of cars; in some cases a pair of 4 ft. 8½ in. rails being laid within the broad gage rails, in other cases only a single rail being laid, so as to be 4 ft. 8½ ins. for one of the broad gage rails.

Pay of City Engineers in Kansas. The members of the city council of Topeka, Kan., have been having something of a squabble amongst themselves regarding the selection of a city engineer. Some of the members of the council favored the appointment of an engineer at a salary of $3,000 per year to serve until the commission form of city government went effect on April 1. The mayor approved this plan and we quote from a Topeka paper some of the reasons for his opposition: "In the first place the councilmen who have expressed themselves in favor of paying a city engineer $3,000 a year have evidently not read the state law in regard to the salaries of city engineers. The State Legislature fixes the salary of the city engineer, and the highest salary we are allowed to pay is $2,000 a year. The salary of the assistant engineer is fixed by ordinance and is $1,200 a year. . . . I am not opposed to paying $2,500 a year for a city engineer, but before we can do so we must have the consent of the Legislature."

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ARKANSAS.

We are advised that the proposed extensions of the Fort Smith & Western R. R. southwest from El Reno and northeast from Fort Smith have not yet reached a point where any definite information can be given out, and it will likely be some time before such information is available.

ILLINOIS.

J. H. McFarlin & Co., Jacksonville, Ill., has been awarded the contract for the grading, bridge work and tracklaying for the construction of the Jacksonville-Springfield Interurban line from Springfield to Jacksonville, Ill. The contract includes about 400,000 cu. yds. of earth excavation, eight bridges, and between 40,000 and 50,000 cu. yds. of concrete. Mr. McFarlin will sublet the grading, concrete work and tracklaying and will be ready to sub the work at once.

MEXICO.

The Cia. Minera "San Juan" y Anexas, S. A., of Mapimi, Durango, Mexico, is to let contracts at the end of March or the beginning of April for the construction of 15 miles of railway between Mapimi and Bermejillo. The work will include 100,000 cu. yds. of light scraper and shovel work, 1,000 cu. yds. of rock excavation and 700 cu. yds. of masonry. L. dela Garza, Mapimi, is superintendent.

MISSOURI.

Mulvill Bros. & Shea., Alton, Ill., and Pat Shea, Medora, Kan., have the contract for filling the base of four trestles on the Rock Island R. R., at Villaridge and La Bodie, Mo., and have sublet part of the work to T. L. Smith, Williamsfield, Ill. Mr. Smith intends letting 30,000 to 40,000 yds. of this work to team outfits. Mulvill Bros. also have 30,000 yds. of good machine team work in sandy loam, on which they wish to get a good team outfit when weather permits. The material is suitable for spring work, as it is the very best sandy loam, very desirable to handle in wet months.

NEVADA.

Regarding the report that the Oregon Short Line R. R. was planning to shortly commence construction on a line between Caldwell, Idaho, and Winnemucca, Nev., we are advised that the Oregon Short Line R. R. Co. some months ago purchased a road known as the San Francisco, Idaho & Montana Ry., which road made surveys from Caldwell, Idaho, to Winnemucca, Nev. The physical property as purchased consisted of some 15 or 20 miles of right of way and grade. The Oregon Short Line R. R. Co. has at this time no intention of constructing this line, or any other line, between Caldwell and Winnemucca. Newspaper articles regarding surveys evidently refer to surveys made several years ago by the old San Francisco, Idaho & Montana Ry.

NORTH CAROLINA

The North Carolina Traction Co. of Danbury, N. C., has completed its organization and has electel the following officers: President, E. Hillman of Aberdeen, N. C.; Secretary, J. W. Krafft of Indianapolis, Ind.; General Superintendent, E. L. Krafft, Indianapolis, Ind.; Director General, Dr. H. P. Mac Knight, Southern Pines, N. C. W. L. Law, president of the W. L. Engineering Co. of Rock Hill, S. C., was selected as chief engineer for construction purposes. The company will construct over 80 miles of new, up-to-date interurban line, motor car system, that will run from Winston-Salem directly north to Stuart, Va.

NORTH DAKOTA.

E. A. Wickham, 19 Scott St., Council Bluffs, Ia., have fresno, wheeler and grader work to let on the following lines in North Dakota: 66 miles on the Chicago, Milwaukee & St. Paul R., and 40 miles on the Northern Pacific Ry. Free transportation can be obtained for outfits, teams and men over the above lines.

OREGON.

The contract for constructing the projected 52 mile line of the Washington-Oregon Traction Co., has been let to D. Fitzgerald, Pendleton, Ore. The road is to extend from Pendleton, Ore., north to Athens and south to Hermiston. Surveys have been made, the capital for construction secured. Samuel Drumheller, Walla Walla, Wash., is president of the traction company.

PENNSYLVANIA.

Smith & Campion, Mahanoy City, Pa., have been awarded the contract for constructing a third track on the Lebanon Valley Branch of the Philadelphia & Reading Ry., between Prescott and Myerstown.

The Titusville Central R. R. Co. is having surveys made for its projected 22 mile gasoline motor car line from Titusville to Corry, via Spartansburg. The capital for construction has been received and contracts will possibly be let in the spring. Jno. J. Carter, Titusville, Pa., is President, R. I. McClellan, Titusville, Pa., is Chief Engineer and Harry Gerson, Titusville, is Secretary.

SOUTH DAKOTA.

E. A. Wickham & Co., 19 Scott St., Council Bluffs, Ia., and Roberts Bros. & Wickham, 123 LaSalle St., Chicago, Ill., have 150 miles of fine grader, fresno and wheeler work to let on the Chicago & Northwestern Ry. in South Dakota. This is fine work in a good country. Both small and large outfits can be used on the work and free transportation for teams, outfits and men can be obtained over the Chicago & Northwestern Ry.

TENNESSEE.

C. C. Tate, Bogalusa, La., has been awarded the contract for 12 miles of tracklaying from Memphis to Lakeview, Miss., for the Lake View Traction Co., of which W. W. Hayden, Memphis, Tenn., is chief engineer.

Mr. Tate was also awarded the contract for constructing 1,025 lin. ft. of pile trestle for the extension.

TEXAS.

The San Antonio Traction Co., San Antonio, is building a 3-mile extension of its Lakeview car line by day labor.

VIRGINIA.

The Mill Mountain Incline Ry., Inc., of Roanoke, Va., has completed surveys and has secured the capital for the construction of its ¾-mile incline up the mountains at Roanoke. Contracts will be let as soon as all the estimates are in. A. B. Hammond is President, and Wingate & McGhee, Roanoke, are the Engineers.

WASHINGTON.

The Big Bend Transit Co. is projecting a 65 mile line from Spokane west, following generally along the Spokane River to its mouth. No decision has been reached as to the time for awarding contracts for constructing the line. L. F. McCoy is Chief Engineer, and William A. Nichols, 105 Howard St., Spokane, Wash., is President.

The Grays Harbor Interurban R. R. Co., is projecting the construction of a 150 mile line from Olympia, Wash., to Hoquiam, Wash. Surveys for the line have not been made as yet, nor has the capital been secured for its construction. A. L. Paine, Hoquiam, Wash., is president and J. M. Clapp, Aberdeen, Wash., is chief engineer.

WEST VIRGINIA.

The City & Elm Grove R. R. Co., of Wheeling, W. Va., has completed surveys for 1½ miles of new track through Park View and Wheeling Park. The construction work will be done by the company. J. W. Smith, Wheeling, W. Va., is General Manager.

WISCONSIN.

John Marsch, Railroad Contractor, Borland Bldg., Chicago, Ill., has been awarded about 56 miles of double track work from the Chicago & Northwestern Ry. Co., between Milwaukee and Clyman, Wis. The work amounts to about 4,000,000 cu. yds. Mr. Marsch has already sublet considerable of the work, but still has some attractive team and shovel work to sublet. He is in a position to show this work to sub-contractors at any time. A. T. Sabin is engineer for Mr. Marsch. This contract was mentioned in our Dec. 29 issue.

CANADA.

The Temiskaming & Northern Ontario Ry. has had a location survey made for an extension of the Charlton Branch from Charlton, Ont., to Gowganda, a distance of approximately 48 miles. No steps have been taken towards calling for bids for the work.

The City of Regina, Sask., invites negotiations with capitalists and others, for the purpose of obtaining proposals for a special franchise for street car services and gas works, for the city, subject to the right of the city to take over the undertaking at the expiry of a definite term of years, at a price to be fixed by arbitration, or in such other manner as may be agreed on. Angus Smith is City Engineer.

Power Developments, Levees, Drainage and Irrigation Works.

ARKANSAS.

The Indiana Rice Co., incorporated under the laws of Indiana, with a capital stock of $200,000, for the purpose of developing the land and raising rice at DeWitt, Ark., proposes to build a canal 7 miles long and to use centrifugal pumps to pump water from the Lagrue River. Geo. C. Doolittle, DeWitt, Ark., is superintendent.

IDAHO.

A plant is being put in at Post Falls, Idaho, to irrigate 3,500 acres near that place. The water is to be taken from Hayden Lake and pumped through a 42-in. wood stave pipe for a distance of five miles. It is expected to have the water upon this land by June, 1910, at which time the land will all be platted and placed upon the market for sale in five and ten-acre tracts. The contract has already been let for the ditch work and pipe laid complete in the ditch. Boyd Hamilton, Coeur d'Alene, Idaho, is interested.

INDIANA.

The Great Lakes Dredge & Dock Co., Chamber of Commerce Bldg., Chicago, Ill., has been awarded the contract for dredging the harbor at Michigan City, Ind., for the U. S. Government. The contract price is 10.9 cts. per cu. yd. and the work includes dredging in the harbor to widen the entrance and the removal of any wreckage that may be encountered. Bids for the work were opened Jan. 4 at the U. S. engineer's office in Chicago.

IOWA.

All bids received Jan. 6, by L. J. Nelson, County Auditor, Forest City, Ia., for ditch work, were rejected and new bids are being asked until Jan. 21. The work includes 176,000 cu. yds. open ditch work and 240 rods 12-in. tile drains in District No. 1, 32,400 cu. yds. open ditch in District No. 8 and 685 rods, 6-in., 8-in., 10-in., and 12-in. tile drains in District No. 3. Work is also noted under Bids Asked.

MINNESOTA.

Contracts for state ditches, bids for which were received Jan. 6 by the State Auditor at St. Paul, have been let as follows: Ditch No. 69 687,938 cu. yds. dredge work, Forrestal & Feyen, St. Paul, Minn., $68,645; Ditch No. 72, 677,755 cu. yds. dredge work, John Kohler, Frazee, Minn., $68,240; Ditch No. 84. 301,217 cu. yds. floating dredge work, Standard Drainage Co., Windom, Minn., $22,301; Ditch No. 88, 599,966 cu. yds. floating dredge work, John Kohler, Frazee, Minn., $48,589.

NEW YORK.

The Board of Water Supply of New York city has awarded the contract for constructing the Kensico dam and appurtenant works for the Catskill aqueduct system to Rodgers & Hagerty. Bids for this work were opened Dec. 21 and the bid of the successful contractors was $7,953,050. The firm of Rodgers & Hagerty is composed of John C. Rodgers, 10 St. Nicholas pl., New York city; James M. Rodgers, 303 W. 89th st., New York city, and John J. Hagerty, Flatbush, N. Y. The itemized bids for this work will be found on page 40 of this issue.

As stated in our last issue the Board of Water Supply of New York city has awarded the contract for constructing the Grassy Sprain cut and cover and other work under contract 53 to the Elmore & Hamilton Constructing Co., Albany, N. Y. Bids for the work were opened Dec. 16, the contract price being $1,485,150. The itemized bids for the work will be given in our next issue.

As stated in our last issue Scott Bros., Baldwinville, N. Y., has been awarded contract No. 44 for constructing a little over 7 miles of the New York State Barge Canal just west of Rome. The contract amounts to $1,750,000 and includes 3,250,000 cu. yds. of excavation, over 90,000 cu. yds. of concrete and a quantity of steel work.

TEXAS.

Williams & Dees, Fort Stockton, Tex., have been awarded the contract for the construction of a 7-mile ditch for the Fort Stockton Irrigated Lands Co., the work including 30,000 cu. yds. of excavation.

The Louisville & Nashville R. R. has acquired land in the vicinity of Boyles, five miles north of Birmingham, Ala., on which to erect large shops and car works.

The Roanoke Electric Light & Power Co. of Roanoke, Va., recently incorporated with capital stock of $1,000,000, has plans underway for a hydro-electric plant on the Roanoke River. M. Coffman, Woodstock, Va., is president and I. T. Stoneburger, Edinburg, Va., is secretary.

The Huasteca Petroleum Co., Dr. G. E. Paddleford, superintendent, Casiano, Vera Cruz, Mexico, is now having the ties cut for its projected narrow gage railroad in the state of Vera Cruz. The railroad will extend 150 miles from the navigable waters of Laguna Tamiahua to Casiano in the heart of the oil field. It will be a narrow gage road and the total cost will be fully $3,000,000. It will open up the entire oil holdings of the company.

According to a statement made recently by C. Hildreth, Franklin, Neb., arrangements have been made to secure capital for the construction of the Dakota, Kansas & Gulf Ry., and preliminary surveys are now under way between Kearney, Neb., and Beloit, Kan., where a connection will be made with the Union Pacific, and ultimately on to Newton, Kan. The length of the entire route is 115 miles.

The Chicago, Milwaukee & St. Paul Ry., will, it is said, take up the matter of building its line north from Harlem, N. D., in the spring. Grading from Harlem to Elliot was completed some years ago, but the project was then abandoned.

The Electric Traction Co., of Richmond, Ky., has plans under way for the construction of an electric railway system in that section of the country. The work contemplated also includes the construction of a 175-ft. dam across Dix's River near Kennedy's Mill and the installation of a 30,000 h. p. plant.

The city of Bedford City, Va., has voted an issue of $100,000 of bonds to establish a hydro-electric plant.

The Georgia Central Ry. is planning a number of improvements for this year and will expend $1,600,000 in the construction of new buildings and yards.

The Capitol Traction Co. of Washington, D. C., is stated to have set aside $1,500,000 for improvements this year.

A company has been formed and is stated to have received the necessary capital for the construction of an electric railway from Lake Andes, S. Dak., to Huron, S. Dak. The proposed route of the railroad is north from Lake Andes, through Douglas County to Stickney, thence to Plankinton, where the road will cross the Milwaukee; then directly north to Wessington Springs, and northeast to Huron. The company plans to build short feeders to the main line and operate both freight and passenger cars. The line is to be completed first to Stickney. William Pease and John Absher, Armour, S. Dak., are interested.

Practically $200,000 has been expended in securing right of way for the Wataugo R. R., and it is stated that active construction work will be started in May. The road is to extend from North Wilkesboro, N. C., to Butler, Tenn., a distance of 90 miles. Frank A. Linney, Ed Coffey and other men of means in Western North Carolina are behind the project. The road will pass through Lenoir and will connect the Southern railway with the coal fields of Tennessee and Virginia by the most direct route.

The Yuqui River extension of the Southern Pacific has been completed to Tonichi, Mexico.

Options have been secured on practically all of the right of way needed for the interurban electric road from Omaha to Fremont, Neb.

Capitalists of Sioux Falls, S. Dak., are projecting another railroad running from Denver to Sioux Falls connecting Charles Mix county and some of the fine agricultural areas. It is stated that the promotion of the proposed road will be started during the coming spring. The road as planned will go to Marion Junction, through Hutchinson and Charles Mix county, and thence west to Denver.

The Virginia & Truckee R. R., W. H. Kirk, chief engineer, Carson City, Nev., has been rushing surveys for an extension of the line from Meriden, Nev., the present terminus, to Wellington, Nev.

A company has been incorporated by Mexican capitalists with a view of extending the track of the Interoceanic system between Teziutlan, in the state of Puebla, and Nautla, in the state of Veracruz. The stock of the company, which is capitalized at 5,000,000 pesos, has all been subscribed in Mexico City, and the preliminary work on the first division from Teziutlan to Jalacingo, La Garita and Huaitomalco will begin early this year. Engineer Leopoldo Villarreol, City of Mexico, is one of the directors.

Grant Brothers Construction Co., Los Angeles, Cal. has begun work in Tepic Territory, Mexico, on its contract for constructing the new Harriman line in Mexico, which will extend from Guaymas to Guadalajara, making connection with the Sonora line of the Southern Pacific, which runs south from Nogales. About 4,000 men are being employed on the general railroad construction work now in progress in Mexico. These are directed by three superintendents who preside over as many departments. The headquarters are located at Mazatlan, Cumuripa and Nacozari.

The Kentucky Highlands R. R. Co. has filed amended articles of incorporation, changing the headquarters for doing business from Frankfort to Louisville. The Highlands has been purchased by the Louisville & Nashville and will be operated by that road, in conjunction with the old Lexington & Ashland, from Versailles into the mountains, as soon as junction of the two lines is completed at Versailles. P. F. Manning, Frankfort, Ky., is General Manager Kentucky Highlands R. R.

The mining syndicate interested in the Corona Copper Co., now operating in Arizona, near Wenden on the A. & C. Ry., has completed the purchase of S. E. Fuller's one-third interest in the water storage project on the east fork of Bill Williams River in Mohave County, the Corona people becoming two-thirds owners of the proposition. A site has been selected for the storage reservoir and about $500,000 will be expended in the work.

Work is reported to have been started on the Lumberton & Elizabethtown Ry., which projects a 25 mile line from Lumberton, N. C., to Elizabethtown passing through large pine forests. The company was chartered late in December and has a capital stock of $250,000. The offices of the company are in Lumberton, N. C., and the incorporators are George B. McLeod, A. H. McLeod, F. A. Bond, J. A. McDougald, and W. P. McAllister.

The city council of Ely, Nev., has refused to grant a franchise to the proposed Ely-Goldfield Ry.

Clell D. Campbell, Lincoln, Neb., has been awarded the contract for constructing a concrete conduit over Antelope Creek, for the Sanitary District of that city, the contract price being $39,900.

Surveys for a prospective electric line between Skohegan, Me., and Athens, Me., have been completed by John Jones, C. E., Lewiston, Me. C. R. Oliver Athens Me. is one of the promoters.

The Hawkinsville & Western R. R. Co. has applied for a charter to build a railroad from Hawkinsville Ga. to either Perry or Fort Valley in Houston County. The company proposes to use an old road bed for about 15 miles of the line. Howard E. Coates Hawkinsville, Ga., is interested.

Surveys have been completed for the projected canal in Florida to the Ocklockonee River. The canal is proposed to extend from Jacksonville, Fla., to Carrabelle. The plan is to cut the canal 12 feet deep and 100 yards wide, and there are places that the sides will require concrete to make it hold. The portion of Ocklockonee River that is used will require practically no work, and the straightening of Crooked River will require as large an expenditure as the dredging of the channel, as a large portion is very deep and over 100 yards wide. The distance from Jacksonville to Carrabelle via the canal will be approximately 127 miles. Capt. W. L. Seeley is in charge of the surveys.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Kansas City Southern Ry. has work under way on constructing its division point at De Queen, Ark. About six buildings, two 550,000 gallon water reservoirs, and a large oil tank are to be erected by the Arnold Construction Co. of Chicago for the Kansas City Southern. L. D. Chase is superintendent in charge for the Arnold Co.

Construction work is stated to have been started three miles east of Van Buren on the Fort Smith & Van Buren Interurban Ry., of Van Buren, the organization of which was mentioned in our last issue. W. F. Keller is president.

Chicago capitalists are backing a proposition to construct an interurban road from Oklahoma City to Shawnee and on east to Fort Smith, Ark. According to reports the road is to go east on Fourth St., at Oklahoma City, south to the Silverwood addition, thence east on Reno Ave. to Shawnee and then on to Fort Smith, Ark. The road is to cross the Frisco tracks in the vicinity of the Silverwood addition south of the state fair grounds and go east, probably to Harrah and Choctaw City.

James Trainor has begun work on his contract to build revetments along the bank of the Arkansas River at the state convict farm at Cummins. He will have a force of 60 men at work for about three months. The improvements will cost $22,000. He is to weave a mattress 100 ft. wide and 2,000 ft. long, which will be placed along the bank of the river at that point.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Arrowhead Reservoir & Power Co., Victor Smith, general manager, San Bernardino, has purchased the Los Flores ranch on the Mojave River. The ranch comprises about 5,000 acres, with valuable water rights.

The John Hannifin Contracting Co., Los Angeles, has moved its outfit to Ehrenburg, where it has secured a contract to do a considerable amount of work for the Blythe estate, consisting of grading and leveling land, building about eight miles of canals and diking along the Colorado River.

F. S. Stratton, receiver of the Ocean Shore Ry., has called upon bond holders and creditors to assist him in completing the road through the issuance of receiver's certificates, for which the approval of United States Circuit Judge Morrow must be obtained. This work, he estimates, will cost on a liberal estimate $3,500,000, which will be sufficient to complete the track laying on the unbuilt section between San Francisco and Santa Cruz and provide the necessary equipment and adequate terminals. Of the above sum $1,000,000 will be needed to lay the track and cut the tunnel on the unbuilt section, and up to date equipment will take $500,000 more. Then $700,000 is required for building terminals. J. B. Rogers, San Francisco, is chief engineer.

The Adams Wharf Co., of Oakland, is to spend a considerable amount of money in repairs and enlarging wharves. The work is to be started immediately.

The dredger San Francisco owned by the California Reclamation Co. on Dec. 27, while being towed down the Sacramento River to throw up a levee on the Sacramento & Southern Ry., struck a snag near Freeport and sank in 25 ft. of water. Work was at once started on raising and repairing the dredge.

The Southern Pacific Ry. has plans underway to enlarge its yards at Sacramento. Much land now lying idle back of the Southern Pacific shops will be filled in by dredgers from the American and Sacramento rivers until the marsh is raised to the same level as the surrounding property. Work was suddenly stopped by the dredgers more than a year ago, after many acres had been partly filled. The reclamation work will again be taken up and rushed at once, according to the announcement, until the ground is in proper shape for many miles of new trackage.

Grading for the California Midland R. R. has been completed between Marysville and Hammonton, and it is expected to have the road in operation between these two cities by March 1. It is expected that the road will be extended to Grass Valley and Nevada City during the summer and fall.

The Oakland Traction Co. of Oakland is to extend the Leise Ave. car line from Penniman St., the present terminus, in a northeasterly direction, to within one block of the new Laurel school, a distance of one mile.

Surveys have been completed between Redwood City and La Honda for the projected electric railroad promoted by A. H. Lohman. It is estimated that road would cost $1,000,000. If built it would bring the rich timber and farming lands of the section into direct communication with deep water and the Southern Pacific at Redwood City.

The Southern Pacific Co. has commenced work on Ellsworth St., in Berkeley, on a branch line into the heart of the city. The new line will leave the main tracks at Woolsey and Adeline Sts., and run to the Allston way entrance to the university campus. The engineers have finished setting the grade stakes for the full distance.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Citizens of Durango have pledged $100,000 to secure the entrance of the Arizona & Colorado R. R. into that city. The railroad is said to have agreed to have its trains running into the city within 15 months from the date of signing the agreement with the city. J. W. Reagan, Tucson, Ariz., is assistant chief engineer.

I. N. Pepper and a company of Montrose men have purchased the Frees mine near Montrose and will spend $100,000 in equipping the mine and in building a railroad from the mine to Montrose.

The construction of two large reservoirs west of Fort Morgan is proposed and Halstead L. Ritter, Denver, has filed maps and descriptions of them with the county clerk at Fort Morgan. The two reservoirs are to be built two miles west of Fort Morgan in the Platte River. No. 1 will have a capacity of 252,500,000 cu. ft., with a dam 20 ft. high and 1,450 ft. long. No. 2 is to have a capacity of 797,081,800 cu. ft. and a dam 25 ft. high and 1,700 ft. long. When completed, they will cover five sections. Under the present specifications it will cost $859,560 for the construction of the two dams alone. Land which will be submerged will cost about $100 an acre. It is said the project will be completed within two years.

Hancock & McMahon, sub contractors on the Milton reservoir of the Standley Lake system have opened offices at La Salle, Colo., to facilitate the handling of materials to be used in the construction of the reservoir. Large quantities of materials are already on hand. The reservoir will cost about $400,000.

Harry E. Knowlton of Denver and Horace Haskins of Platteville are planning a $10,000 reservoir for the semi-arid tract northeast of the latter place.

The Denver & Rio Grande Ry. is said to be planning installing additional yard and trackage facilities at Colorado Springs, as well as the erection of a 10 or 12 stall round house.

The reclamation of a large tract of land near Breed, about six miles south of Colorado Springs is proposed, and it is understood that a large reservoir is to be constructed at some point along Cottonwood Creek for this purpose. About 30,000 acres of land will be put under irrigation. H. B. Neff, 209 East Fountain St., Colorado Springs, is reported to be interested.

Several Colorado men, among whom are N. B. Hames, Colorado City, and T. J. Skaggs of Colorado Springs, have formed a company for developing a large tract of land in San Juan County, N. Mex. Several reservoirs will be constructed and the land opened up for irrigation. About $100,000 will be expended.

The construction of a standard gage steam railroad into the Black Hawk and Central mining districts of Gilpen county is proposed. Advices from Central City state that the Hall Construction Co., which has started the building of the road from Pactolus, on the Moffat road, to Black Hawk, held a meeting of its directors Jan. 10 to vote on increasing the capital stock of the company from $80,000 to $500,000 for the purpose of raising funds to build the proposed spur. The Pactolus spur was graded for five miles towards Black Hawk during the past summer, the Hall Construction Co. doing the work. It will be 15 miles long and will be the first broad gage line into the Black Hawk district.

The Grand Junction Interurban Company has purchased terminal sites at Grand Junction and announcement has been made that work on constructing the line to Fruita would be commenced as soon as the weather would permit, and that the line would be in operation by June 1. All necessary material for the work is now on hand. The Southern Colorado Power Co. has authorized a $5,000,000 bond issue and will increase the capacity of its Trinidad steam power plant.

Advices from Denver state that the directors of the Henrylyn ditch and reservoir project have awarded the contract for the work to the Camfield Construction Co., which is composed of the principal stockholders of the irrigation project. The work covered by the contract will bring under water about 120,000 acres of land in the vicinity of Denver. The consolidated Henrylyn project includes the original Henrylyn irrigation district, the Hudson Reservoir company, the Schaffer Land and Live Stock company, the Intermountain Water company, and the Golden-Littleton irrigation district. A bond issue is to cover the cost of consolidation and construction work. The work will cost about $4,421,500.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Georgia Power Co., which controls a water power on the Tallulah River, in Habersham County, Georgia, has been granted permission by the Georgia State Railroad Commission to issue $4,450,000 first mortgage gold bonds, $3,000,000 of preferred stock and an additional $1,450,000 of common stock. The money realized from the sale of these securities will be put into the development of the property.

J. A. J. Henderson, Ocilla, Ga., President of the Ocilla Southern Ry., has purchased the turpentine and saw mill timber belonging to the late D. L. C. Harper, of Berrien County, and intends extending his railroad, which now runs from Ocilla to Alapache and on to Adel, so that it will pass directly through this belt of timber.

The Mutual Light & Water Co. and the City & Suburban Railway Co., of Brunswick, controlling the light, water power and transportation franchises in that city, have passed into the control of a new $10,000,000 stock company, the Brunswick Terminal & Railway Securities Co., which succeeds the $5,000,000 Brunswick Dock & City Improvement Co., which for years has owned nearly 2,000 lots

in this city in addition to considerable acreage in the suburbs. One result of the merger will be that the proposed extension of the Georgia Coast & Piedmont from Darien to Brunswick will be put through as soon as McIntosh and Glynn counties provide for the bridges across the Altamaha River.

The Southern Ry. is planning to start work shortly on the construction of a transfer station and shed with additional tracks at the Inman yards at Atlanta. The cost of the work will be about $100,000.

At a recent conference of officials of the Southern Ry. estimates were considered for the work to be done immediately, which totalled up practically $5,000,000. The Southern is doing much double-tracking on the main line between Atlanta and Washington, and will take up this end of the line later. The year 1910 promises to be a year of construction for this road. W. H. Wells, Washington, D. C., is engineer of construction.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

At the end of December about two-thirds of the grade had been completed for the new branch track that the O. S. L. R. R. is building between Rupert and Bliss and the line will be completed early next spring. Work upon the grade will be resumed immediately the frost is out of the ground. Track laying will go on simultaneously. The railroad company will lay down five miles of sidetrack at Bliss, which will not only be the junction with the main line but the end of a division as well.

The Utah Construction Co., Ogden, Utah, has begun grading work for the new branch line of the Oregon Short Line between Burley and Oakley, in Cassia county. The distance between the two towns is about 25 miles, and the laying of rails will proceed just as soon as the grade is in readiness.

Engineers of the Minidoka & Southwestern Ry. are making surveys for the extension of its line from Salmon Falls Dam to the new town of Jarbidge, a distance of 50 miles, making the total length of the road from Twin Falls, Ida., to Jarbidge, 85 miles.

Citizens of Wallace, Idaho and Cour d' Alenes are taking steps toward securing the construction of an extension of the Spokane & Inland Empire Electric Ry. System from Coeur d' Alene City to Wallace. R. A. Wilson, Wallace, Idaho, is interested.

Work is being rushed on the Gilmore & Pittsburg R. R., and it is believed that the road will be completed to Salmon City by February. The cold weather conditions of the past few weeks have delayed the grading work somewhat, but the tracklaying has been continued.

Efforts are now being made to have the Minidoka & Southwestern R. R. extend its line from the Salmon River dam into the new gold country, a distance of about 90 miles. The Hollister branch of the Minidoka & Southwestern is already completed to the Salmon River dam, 50 miles from Jarbridge, and one of the advantages of building to the new camp from this point would be that of grade, it being almost a level route for the remainder of the way. Acording to a statement of Alex. McPherson, Twin Falls, engineers are to be put in the field as soon as the weather permits to survey a line from the Salmon River dam to the new town of Jarbridge.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The dam in the race surrounding the wheel pit of the Keystone plant of the International Harvester Co. at Sterling was washed out by high water and ice on Jan. 2. The loss is estimated at $50,000.

The Illinois Central, Nickel Plate, Lake Shore and Fort Wayne railroads have been making progress with their Grand Crossing track elevation work at Chicago.

Efforts are being made by residents of Oreana, Argenta and Cisco and the farmers of those communities to interest William B. McKinley, president of the Illinois Traction Co., in the construction of an interurban line from Decatur to Monticello, paralleling the line of the Illinois Central and passing through those three villages. The line will be about 25 miles long. Among those interested are Charles A. Denison and John Armstrong of Argenta, Mel Boyer of Oreana and Jesse Young of Cisco.

The Illinois Tunnel Co., of Chicago, which has a franchise for a telephone system in Chicago, is stated to have decided to go ahead and install a system. Negotiations are said to be already under way for the necessary equipment for 20,000 'phones for Chicago.

Right of way is being secured for the proposed railroad from Spring Valley to Peoria, via Lacon. Fred Collins, Lacon, is interested.

The maintenance of way department of the Illinois Traction System is now engaged in the construction of belt lines at the following cities: Decatur, 5 miles; Springfield, 6 miles; Edwardsville, 1.6 miles; Granite City, 1½ miles. L. M. Martin, Decatur, Ill., is the engineer in charge.

The St. Louis, Springfield & Peoria R. R. Co. was chartered at Springfield on Jan. 7. The principal office is to be at Champaign, and the capital stock will be $5,000,000. The company proposes to construct a line from a point in or near Madison, Ill., thence northeast through the counties of Madison, Macoupin and Sangamon, to Springfield; also a branch line from Staunton, in Macoupin county, to Litchfield, Montgomery county; thence in an easterly direction to a point in or near the city of Hillsboro, Montgomery county. The company is incorporated to take over all the McKinley lines between East St. Louis and Springfield, and Staunton and Litchfield, and Litchfield and Hillsboro, under one company. The incorporators and directors are: George M. Mattis, W. H. Carnahan, Charles Zilly, B. F. Bramble and Charles E. Cox, all of Champaign.

The Northwestern Construction Co. of Milwaukee, Wis., has been awarded the contract for building an interurban electric line from Sterling to Rock Island, Ill., a distance of 62 miles. The estimated cost of the line is $1,240,000. Work will start early in the spring.

The Peoria Terminal Ry. Co. of Peoria is reported to be planning to have work started soon on the construction of its new line, depots and terminal facilities at Peoria. The company is said to have already placed contracts for several hundred thousand dollars' worth of equipment, engines, cars, rail, ties, etc. The work will be done under the direction of General Manager Burrill.

The Des Plaines Valley Ry. Co., the belt line of the Chicago & Northwestern to connect, at Elmhurst and Glencoe, the north and west lines of the Northwestern, has acquired its right of way between these north and south suburbs of Chicago, and has made record of all the purchases. The line is to run through the townships of Proviso, Leyden, Maine and Northfield. About $500,000 has been spent by the company in acquiring the right of way lands and other ground space for storage yard purposes.

The Baltimore & Ohio R. R. has purchased the Chicago Terminal Transfer R. R. Co., having purchased the property at a foreclosure sale for $16,000,000.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Pennsylvania lines west of Pittsburg have closed the deal for the use of the Fort Wayne division for a tract of 3½ acres of land at New Brighton. The acreage is needed by the railroad company for changing the track and connecting up the line to the track changes recently made at Beaver and other points.

The Baltimore & Ohio R. R. is said to be planning to have work started this spring on its new round house and machine shops at Garrett, where the western division shops of the road are located.

F. Y. Keator and J. S. Hopkins, representatives of the Gary-Hobart-Valpariso Traction Co., which projects a line connecting those cities, have succeeded in securing an extension of the franchise, identical with the previous one except that the company has the choice of two routes through Hobart, either Center or Main St. Construction work will be started early this year.

A number of improvements are planned for this year by the Baltimore & Ohio Southwestern Ry., on its line between North Vernon and Milan. The curves and grades east of North Vernon will be eliminated and the line will be double-tracked to Oakdale, a distance of four miles. A concrete arch will take the place of the iron bridge over the Muscatatuck River.

The Bluffton, Geneva & Celina Traction Co. of Bluffton, has increased its capital stock from $30,000 to $675,000. Wm. A. Kunkie is president.

Robert Skinner Moore, who has been with the Henry Taylor Lumber Co. of Lafayette for some time, has resigned and will engage in contracting.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A company is being formed at Waterloo to carry out the proposition advanced by the Chamber of Commerce of that city for the construction of a line of railroads south from Waterloo. Surveyors are to be sent out at once, it is said, over the proposed routes to make estimates of the cost of construction.

Although nothing positive can be learned it is believed here in Muscatine that the Muscatine North & South Ry. will have work started in the spring on an extension to Burlington. All the surveys have been made for the work and it is understood that the contract for the work has already been given to an eastern firm of contractors. It is also believed that in the spring of 1911 the road will be extended to Davenport by the way of Sweetland Center and Blue Grass. Charles Howard, Muscatine, Ia., is General Manager.

The Chicago & Northwestern Ry., is reported to have secured an entrance to Davenport over the right of way on the Iowa & Illinois interurban railway. Articles of incorporation have been filed at Clinton for a subsidiary Iowa & Illinois Ry. Co., and it is believed that this company is to be a terminal association to control the terminals at Clinton and Davenport. Application is to be made to the city council of Davenport for a franchise for a track and for land for terminal purposes. Henry Thuenen, Jr., Davenport, Ia., is Vice President Iowa & Illinois Ry.

Business men of Iowa City have raised a guaranty of $100,000 to insure the building of an interurban to Davenport.

It is probable that the interurban line will this year be extended from Centerville to Numa, Cincinnati and Exline in Appanoose county at a cost of $250,000.

The Waterloo, Cedar Falls & Northern R. R., T. E. Rust, Chief Engineer, Waterloo, is reported to be planning to expend $500,000 this year for improvements to include an extension of the interurban line from Denver Junction to Waverly, addition to power plant, double tracking and residence extensions, new equipment, etc.

The county commissioners at Newton have had surveys started for the Skunk River ditch, from Colfax to the southeast corner of the county. The length of the proposed ditch will probably be about 20 miles. The length of the river between those two points is approximately 60 miles. This is the largest undertaking of its kind in the state.

The sum of $100,000 has been raised in Iowa City for the proposed Davenport-Iowa City interurban and work was started Jan. 3 to raise $300,000 in Davenport and $100,000 along the right of way. The promoters of the road have a contract with an eastern trust company to bond the road to the extent of $1,500,000, upon the sale of $500,000 in preferred stock and the securing of the right of way. Most of the right of way has been secured, and it is thought there will be no trouble about what is left.

An injunction has been secured in the Supreme court of Iowa by the Illinois Central

R. R. against the Fort Dodge, Des Moines & Southern Interurban Co., preventing it crossing the Illinois Central tracks south of Fort Dodge. This will probably prevent the interurban from making its proposed extension until after the case is heard at the May term of the Supreme court.

The Lytle Co., of Sioux City, Ia., has been incorporated with a capitalization of $100,000 and will do a general business in architecture, engineering and construction. C. F. Lytle is president, Leonard Lytle is vice president and L. W. Lytle is secretary and treasurer. The new company will work in conjunction with the Lytle Construction Co., and has been incorporated to cover a field of operations that the older company is limited in by its articles of incorporation.

Business men of Marengo, are taking steps toward securing the construction of an interurban electric line between Cedar Rapids, Ia., and that place.

An application has been made to the city council of Sioux City, for a franchise for an interurban line projected from Parkston, S. Dak. Surveys for the line have been made and two-thirds of the right of way has been secured. The road will be known as the Yankton, Norfolk & Southern Ry., and it will extend from Parkston through Sioux Falls, Freeman, Yankton, Centerville, Elk Point and thence to Sioux City. C. A. Magee, Pittsburg, Pa., is president.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Garden City, Gulf & Northern R. R. has completed its first 40 miles of track between Scott City and Garden City. As soon as spring opens it is said that the construction work will be continued from Garden City south with the Gulf as the final destination. The Kansas Construction Co., B. M. McCue, Garden City, Kan., had the contract for the first 40 mile section.

The Cherryvale, Oklahoma & Southwestern Ry. Co., has been financed in France and it is said that construction work on it will be started shortly. The first section to be built will extend from Caney, Kan., south 100 miles through the oil and coal district of Oklahoma to the white oak lands of this state, where it is proposed to obtain timber for ties for the remainder of the road. The survey for lines from Cherryvale, Kan., through Pawhuska and Guthrie to Geary, Ok., and from Caney, Kan., to the Grand River, has been made. The first is 235 miles long and the second 78. Bonuses for this road have been raised in some of the Northern Oklahoma towns. State Senator S. M. Porter, Caney, Kan. is the principal promoter of this road.

A bill has been introduced in congress to authorize the Atchison, Topeka & Santa Fe R. R. to extend its tracks over the Fort Leavenworth military reservation to connect with the government's terminal. The work is to be done by the railroad company without expense to the government.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Advices from Gladwin state that W. C. Cornwell has made tentative plans for a dam across the North Branch in Arthur township.

The Baraga common council has granted a lease to the firm of Charles Hebard & Son, Inc., of Pequaming, and one to the D. S. S. & A. R. R. company for the foot of Ontonagon St. for the purpose of building a dock, also laying a spur track on the dock. Work on the construction of the dock will commence as soon as the ice and the weather will permit.

The Commonwealth Power Railway & Light Co. of Michigan has been organized with a proposed capital of $18,000,000 divided into $6,000,000 preferred and $12,000,000 common stock. The following companies are to be included in the merger: Commonwealth

The Detroit Terminal R. R., of Detroit, owned by the Michigan Central, Lake Shore and Grand Trunk Rys. and usually known as the outer belt line, has succeeded in securing right of way west from Woodward Ave., to the Michigan Central tracks at Plymouth Road.

The Michigan United R. R. Co. is reported to be negotiating for the purchase of the Owosso & Corunna electric line.

Power Co. of Grand Rapids; Muskegon Power Co.; Saginaw-Bay City Railway & Light Co.; Grand Rapids Railway Co.; Michigan Light Co.; Flint Electric Co.; Flint Gas Co.; Cadillac Water & Light Co.; Charlotte Electric Co.; Pontiac Gas Co.; Shiawassee Light & Power Co., and Au Sable River property and rights. The new concern is being formed by a syndicate of New York, Philadelphia and Michigan bankers, including Hodenpyl, Walbridge & Co. of New York, F. W. Clark & Co. of Philadelphia, and W. A. Foote of Jackson, Mich. The plans of the project call for the development of the Au Sable River by 13 or 14 dams, covering the river for a distance of 90 miles from its mouth. The engineers estimate that 66,000 H. P. can be secured. The dams on which work has already started call for the development of 10,000 H. P., with which the work will be started. The total cost of the dams will be some $7,000,000 or upwards.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Negotiations are underway with the power company at Little Falls to furnish the necessary power for a proposed electric railway from Little Falls, to Alexandria by way of Long Prairie. The proposed line will run from Douglas county to Long Prairie, the county seat of Todd county, thence to this city, the seat of Morrison county. A number of Long Prairie business men are interested. Henry Diebel, Long Prairie, is one of the promoters.

The Consumers Power Co., of Stillwater, will expend about $20,000 in March in laying about 13 miles of gas mains. The pipe has already been ordered.

The Great Northern Ry. Co., has purchased an additional 150 ft. of right of way from Red lands to Lengby, Minn., and it is supposed that the company is contemplating double tracking its line between those two points.

The plant of the Faribault Gas & Electric Co. of Faribault has been sold to H. M. Byllesby & Co. of Chicago. They have also purchased the 20,000 H. P. water falls at Cannon Falls and will transmit power to Faribault.

The Soo is reported to have men in the field looking for a route for a possible extension of a branch northeastward from Thief River Falls to a junction with the Canadian Pacific.

Duluth and the Ranges.

BY PETER E. MEAGHER.

C. G. Borchert, representing the Arthur Koppel Co., was a caller this week.

Peter Nelson, the railroad contractor who is working at present on the Soo Line, came in and made us a visit a few days ago. He is working one steam shovel at present and intends to continue running the same all winter.

John Runquist, the contractor, was awarded a new job for the Duluth, Missabe Northern Ry. There are about 150,000 cu. yds. in this work. This is a steam shovel job, and Mr. Runquist has already commenced working on the same.

W. F. King of W. F. King & Co., contractors, was a visitor recently. They are engaged on three or four concrete jobs for the Duluth, Missabe Northern Ry. Co.

H. C. Stansill, representing the Kilbourne & Jacobs Co., was a caller here last week and left for a trip to the Range country.

J. B. Mischler, railroad contractor, was a caller recently. He is figuring on some new work, but is not doing anything at the present time.

P. K. Anderson, boarding car contractor on the Duluth & Iron Range and Duluth, Missabe Northern railways, was a caller at this office. He is boarding quite a few men at the present time.

Arthur Mitchell, who is in charge of some new construction work in Canada, dropped in to see us last week. He is here on a vacation visiting with his family.

J. P. Joel, traveling representative for the Vulcan Iron Works Co., Wilkes-Barre, Pa., dropped in to see us on his way in from the Coast Country. He reported business very good.

F. J. Anderson, superintendent for Foley, Welch & Stewart, contractors, who are doing all the construction work for the Minneapolis, St. Paul & Sault Ste. Marie Ry. Co., spent a day with us recently. They had just let 24 miles of work, part of it steam shovel work, and the balance team work, to be started immediately.

J. E. Erickson of Murphy Brothers & Erickson, railroad contractors on the Soo Line, was a caller this week and said they were rushing their work as fast as possible and would continue to do so all winter.

F. C. Peabody, superintendent for Dale & Bumgardner, who have three steam shovels working on the Soo Line, was a caller and said they have closed down two of their shovels, and are moving them farther up the line and expect to start in working again very soon.

Richard Evans, steam shovel contractor on the Soo Line, has shut down one of his shovels on account of frost. He does not expect to start the same until later on in the season.

Greer Thompson, general superintendent for Drake & Stratton Co., steam shovel contractors on the Mesaba Range, was a visitor here this week. They are working quite a few men, and will continue to do so all winter.

The Duluth, Winnipeg & Pacific Ry. Co., with headquarters in Duluth, who are going to let a contract for 87 miles of work, have not done so as yet. I understand that they are ready, but are having some trouble over their right-of-way getting into Duluth. The same has not been settled at this writing.

H. J. Cooper, contractor from the Range, visited us this week. He is not doing anything at the present time.

The labor market at Duluth at present is in a very good condition. There is quite a demand for men, and about men enough to fill all the positions offered. The wages are the same as they were thirty days ago, and there will undoubtedly be no change for about 60 days.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Mississippi Valley Transportation Co., W. K. Kavanaugh, President, is having steel barges built and expects to start its first boat out of St. Louis for New Orleans on March 1. In connection with transportation project the company is reported to be planning to spend nearly $1,000,000 in the near future in terminal facilities in the cities and towns along the river between St. Louis and New Orleans, including both points. It is estimated that the terminals in St. Louis, which will be modern in every way including loading and unloading by the electric derrick system, will cost at least $225,000. Cairo, $50,000; Cape Girardeau, $10,000; Hickman, $10,000; Memphis, $100,000; Helena, $50,000; Greenville, $25,000; Vicksburg and Delta, $100,000; Natchez, $25,000; Baton Rouge, $50,000, and New Orleans, $200,000.

An appropriation of about $2,000,000 is stated to have been made by the Atchison, Topeka & Santa Fe Ry. for continuing double tracking its Missouri Division.

The Kansas City Junction Ry. Co., of Kansas City, Mo., is reported to have abandoned its old right way, and will have surveys made for a new right of way for its proposed Missouri River front terminal system. The old route paralleled the tracks of the Edgewater Connecting Railway Co. in Kansas City, Kan., and in the Missouri River bottom north of the city. The terminal system was to be used in connection with a new bridge across

the Missouri River north of Kansas City, Kan., and a new double track road to St. Joseph, Mo.

H. V. Johnson and H. E. Insley of Kansas City, Mo., promoters of the Kansas City & St. Louis Electric Ry., are reported to have stated that right of way has been secured through Boone County and that construction work will commence as soon as the right of way through Saline can be obtained. As proposed the line will be double tracked, and will be equipped with all modern devices.

A proposition is to be submitted to the stockholders of the Missouri Pacific R. R., at a special meeting to be held Jan. 18, at St. Louis, providing for the authorization of $175,000,000 of 5 per cent 50-year first and refunding mortgage bonds, convertible into the company's stock at par from Sept. 1, 1912, to Sept. 1, 1932. These bonds will be redeemable at 110 and interest Sept. 1, 1917, or on any subsequent interest day. Of the total issue of $175,000,000 of Missouri Pacific bonds, $90,633,000 will be reserved for refunding prior lien bonds and $6,500,000 to refund equipment obligations; the sum of $52,866,500 is to be used for betterments, additions and equipment, and $25,000,000 will be used for mortgage bonds of the St. Louis, Iron Mountain & Southern railway, to be issued for betterments and additions. The $29,806,000 of bonds which will be issued at 95 will enable the Missouri Pacific to pay off its floating debt and leave a balance to be used for betterments, improvements, and additions, for which a comprehensive plan has been prepared.

The Springfield Gas & Electric Co. of Springfield is to erect a larger and more modern gas plant at the corner of Main St. and Phelps Ave. The property has been acquired from the Frisco in exchange for the gas company's property at Main and Mills Sts. The Frisco is to use the land for enlarging its track and depot facilities.

Preliminary work has progressed very favorably for the construction of the proposed interurban line from Springfield to Carthage, and it is believed that the work will be undertaken this year. W. A. Bixby, Springfield, is interested.

St. Louis Items.

BY A. B. KOENIG.

W. L. Mosby, Deeson, Miss., has 40,000 yards of levee enlargement work in Lake County, Tenn., six miles north of Tiptonville, to sublet at good prices.

The Board of Public Improvements at St. Louis will open bids on Feb. 11th for a new 5 to 11 ft. sewer in the New North Harlem Creek Joint Sewer District, the sewer to be 2¼ miles in length. The total cost is estimated to be $246,120. Nearly a mile of it is to be 10 ft. 10 ins. in diameter; more than a half a mile is 9 ft.; both sections to be of concrete, and three sections nearly three-quarters of a mile are to be of brick ranging from 4 ft. 7 ins. up to 7 ft. 6 ins. in diameter. Following is the proposed location, size and length of the six sections: From Bircher St. and Newstead Ave. to King's Highway, 4,792.71 ft., the sewer is to be 10 ft. 9⅝ ins.; from King's Highway to 530 ft. west of Union in Bircher, 3,557.20 ft., it is to be a 9 ft. sewer; from 530 west of Union to Emerson, 475 ft., it is to be a 7½ ft. sewer; from Emerson to Thrush, still in Bircher, 1,737.16 ft., it is to be 7 ft.; from Thrush to Wren, 717.84 ft., it is to be 5½ ft., and from Wren to Partridge, 808 ft., it is to be a 4 ft. 7 in. sewer. It is to drain a large territory in the northwestern part of the city and is to be paid from jointly by the city and the property owners.

The Board of Public Improvements at St. Louis have asked for bids to be opened Jan. 21st, for the improvement of the following streets, aggregating seven miles and estimated to cost $400,000:

Henry Schweiter returned here for the holidays minus his right eye, which he lost through a premature explosion of some dynamite caps that his foreman was using in blowing frost at Danville, Ill. One of the caps got too near a fire and started off the whole box of them. One of them hitting Schweitzer in the eye and two in the cheek. We are very glad to announce that Schweitzer is up and around again and as alive as ever, while his foreman is still in the hospital at Danville, Ill. From the latest accounts he is doing nicely and will recover.

Asphalt—Rowan, between Ridge and Easton; Arkansas, between Winnebago and Miami; New Ashland, between Labadie and Ashland; Shamut, between Wells and Easton; Theodosia, between Academy and Union; Theodosia, between Union and Arlington.

Brick—Pennsylvania, between Osage and Chippewa; Alfred, between Scanlan and Arsenal; Fassen, between Broadway and Virginia; Louisiana, between Cherokee and Gravois; Canaan, between Broadway and Newby; Henrietta, between Compton and Louisiana; Twenty-first, between Palm and Branch; Potomac, between Wisconsin and Jefferson; Natural Bridge road, between Fair and Taylor; Dakota, between Nebraska and Minnesota; Michigan, between North Dakota and Osceola; Grace, between Fairview and McDonald; Twenty-first, between Penrose and Ferry; Spring, between St. Louis and Natural Bridge road; Twenty-second, from Cass to Herbert; Pestalozzi, from Thirteenth to Jefferson.

Bitulithic—Connecticut, between Russell and Morgan Ford road; Scanlan, between Morgan Ford road and Alfred; Twenty-second, from Washington to Cass.

Granite—Manchester, between Barron and Sublette; Manchester, between Tamm and Prather.

The board has prepared ordinances for opening the following streets and alleys:

Shenandoah, now known as Tower Grove Place, private from Alfred Ave. to King's Highway.

Tennessee and Alaska, from Iron to Fillmore.

Maffitt, from King's Highway to Union.

Alley between Florissant, Harney, Bernays and proposed Union.

Alley between Thekla, Lillian, Bernays and proposed Union.

Alley between Lillian, Bircher, Bernays and proposed Union.

Alley between Warne, Sarah, Garfield and North Market.

Alley between Edwards, Macklind, Wilson and Daggett.

Alley between Kossuth, Lee Clay and Fair.

Alley between Belt, proposed Clara, Waterman and King's Highway.

Alley between Walsh, Delor, Vermont, Virginia and Alabama.

Alley between Itaska, Neosho, Louisiana and Tennessee.

Alley between Goodfellow, Hamilton, Theodosia and Cote Brilliante.

Alleys between Itaska, Neosho, Tennessee and Grand.

Alleys between Arsenal, Crittenden, Ohio and Iowa.

Alleys between Daggett, Shaw, Cooper and Edwards.

Alley between Edwards, Macklin, Daggett and Shaw.

Alleys between Shaw, Pattison, Cooper and Edwards.

Alley between Edwards, Macklin, Shaw and Pattison.

Alley between Edwards, Macklin, Shaw and Pattison.

Alley between Maffitt, St. Louis, Cora and Marcus.

Alley 1,118 feet west of Union, proposed Clara, Kingsbury and Washington.

Chas. L. Gladheart has taken a piece of Big Four work from Henry Schweitzer in Illinois.

R. E. Oliver and Mr. Callaway of Oliver Bros. & Callaway, spent a few minutes with us the other day. Nothing new.

President Reber of the Board of Public Improvements called the new sprinkling contractors before him last Wednesday and impressed upon them that all the contracts and specifications must be carried out to the letter. He told them that the specifications meant just what they contained, and any violation would result in the annulment of the contracts. In the past it has been shown that contracts have been let to one contractor and sublet to another, with the result that the first contractor made a handsome profit. President Reber told them that this would not be permitted and any attempt at such procedure would result in the annulment of the contracts.

McCann Bros., Murphysboro, Ill., have a piece of work to let suitable for about 15-team outfit.

Suits recently filed in the Clayton Circuit Court by Robt. L. Shackelford, prosecuting attorney of St. Louis County, against the St. Louis, Montesano & Southern Railway Company, asking that their two bonds, amounting to $10,000, be forfeited, will be dismissed this week, according to Shackelford. The County Court met last Wednesday as a committee with representatives of the railway company and reached an agreement. The suits were filed following failure of the company to comply with the conditions of its franchise. The company after tearing up Lemay Ferry road in Carondelet Township for about 8,000 ft., stopped work. According to the agrement which was reached last Wednesay the company will immediately put the road in the condition it was before work was started, the reconstruction of the road to be superintended by a man named by the County Court. The representatives of the road who met the members of the County Court last Wednesday are: Former Judge August Kassebaum, Chas. W. Gutke, Wm. Ruprecht and Wm. Heil.

J. H. McFarlin, Jacksonville, Ill., was awarded the contract for grading, track laying and concrete work on the new Springfield and Jacksonville Electric Ry.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Wall Kill Transit Co., which has lines in Middletown and to Goshen, eight miles away, is planning to build a new line to Montgomery from Goshen, a distance of ten miles. At the same time it is understood that the Orange County Traction Co., with lines in the city of Newburgh and to Walden, twelve miles away, will build a new line from Walden to Montgomery, connecting with the Wall Kill Transit Co. The Orange County Traction Co. is controlled by former Governor Odell and it is believed that the connecting of the two big lines means a consolidation under Mr. Odell's control.

The New York State Public Service Commision has granted the application of the New York Central & Hudson River R. R. Co. for an extension of 18 months for the completion of the work in depressing the tracks and building a new terminal at the Grand Central station in New York city.

McCracken, Hauer & Terry of New York city are working a 70-ton Bucyrus shovel on their sub-contract from the Jacobs Construction Co. of Pittsburg, Pa., for construction work on the Delaware & Eastern R. R. from Grand Gorge to Blenam, and expect to put in two mine shovels shortly. This is all heavy work and covers about 20 miles of line for the Delaware & Eastern. The Jacobs Construction Co. has two shovels working and Fisher Curzzo also has a Marion 20 on the job.

The Manhattan Bridge Three-Cent Line was incorporated with a capital stock of $50,000 and proposes the construction and operation of a double track street surface railroad from Flatbush and Fourth Aves., Brooklyn, N. Y., to and across West St., at Desbrosses St., in Manhattan, N. Y., a distance of 5 miles. The directors of the company are: Andrew D. Baird, Walter Hammitt, Edward T. Horwill, Charles J. Edwards, Simon J. Harding, John H. Mowen, William F. Neu, Charles E. Parkins, Thomas P. Peters, M. D. Smith, F. W. Rowe, F. H. Tyler, F. W. Wurster, J. C. Brackenridge and Almet R. Latson.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city council of Toledo will shortly pass the final legislation for the separation of grades where Hawley St. is being opened

across Swan creek. The cost will approximate $93,000 and will be divided between the Lake Shore Ry. and the city. The $40,000 necessary to separate the grade of Post St. and the Michigan Central and the Lake Shore roads will be equally shared by the city and the railroads.

The Baltimore & Ohio R. R. is stated to be planning to expend $4,000,000 this year on the Chicago Division. One of the principal pieces of work will be at Defiance. The Defiance improvements consist of the elevation of the tracks through the city, the elimination of seven grade crossings and the construction of viaducts in their place, the extension of the Defiance yards and the building of a new freight depot and passenger station.

Work is to be started shortly, it is said, to complete the line of the Lake Erie, Alliance & Wheeling R. R. (New York Central lines) from Dillonvale to Wheeling, W. Va., a distance of 17 miles. F. W. Watkins, Alliance, O., is superintendent.

The Fremont Power & Light Co. of Fremont, has proceedings underway to condemn three acres of land in Ballville for use as a site for its new power house.

The River and Harbor Committee of the Chamber of Commerce of Cleveland has asked the city council of that city to appropriate $100,000 for the dredging and making navigable of the Cuyahoga River.

The Chespeake & Ohio R. R. is reported to have negotiations under way for the purchase of the Eastern Kentucky Ry., a short line operating 36 miles of road in Kentucky. The Eastern Kentucky Ry. has had an extension in view for sometime and it is believed that if the deal goes through the extension will be built by the C. & O.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city commissioners of Ardmore have awarded the contract for raising the dam at the city lake to the Healey Construction Co., Shawnee, Okla. The dam will be raised sufficiently to double the capacity of the lake which is the source of the city's water supply. The contract price is $7,300.

Reports here at Oklahoma City indicate that a deal may be under way for the sale of the Altus, Roswell & El Paso Ry., now under construction by Edward Kennedy, to the Missouri, Kansas & Texas. There is also said to be a probability that the Missouri, Kansas & Texas may also purchase the Fort Smith & Western and the St. Louis, El Reno & Western railways and build an extension of these lines from Oklahoma City along the proposed route of the Altus, Roswell & El Paso. There is also a strong probability that the route of the new road may be altered to enter Oklahoma City and become an extension of the Missouri, Kansas & Texas from there.

The Denver & Gulf R. R. chartered in Oklahoma several years ago is stated to have purchased the steel and ties for building its line out of Texhoma in two directions. A northwest line will run through Texas and Cimarron counties and through Colorado to Lamar, where a connection will be made with the Santa Fe for Denver. This line will be built on one of the old Denver and Gulf surveys through Western Oklahoma. F. A. Upstead of Minneapolis, Minn., an old-time railroad builder is the president. The other line from Texas is to be built southeast across the Texas Panhandle.

Charles E. Hagerty, county surveyor, Muskogee, has started preliminary surveys for the projected railroad from Warner to Webbers Falls.

A company has been formed by Oklahoma City business men for the purpose of constructing a railroad for Northwestern Oklahoma. Surveys for the line are said to have been completed and the necessary funds for its construction are reported to be assured. As proposed, the line will extend from Oklahoma City to Trinidad, Colo.

The Commercial Club of Ardmore has taken up the proposition of securing a bonus for a line of road from Ardmore to Lawton. It is believed the Rock Island can be induced to enter this field. The cities of Lawton and Duncan and all towns intermediate will be asked to get busy on the best proposition they can make to secure the line, and when the reports are compiled they will be forwarded to the general offices of the Rock Island with the hope that the company will take the matter in hand.

Announcements have been made by various railroad officials that 2,500 miles of new railroad, already surveyed, will be built in Oklahoma in the event of the adoption of the constitutional amendment recently initiated, which removes the restrictions against the sale of domestic lines of foreign corporations, and allows the foreign roads to exercise the right of eminent domain.

Major E. C. Gordon, promoter of a railroad to run north from Chickasha, near the Red River, to Liberal, Kan., has raised over $30,000 on 90 miles of the proposed line south of the Canadian River, including bonuses from Weatherford, Anadarko and Chickasha. Other towns in Oklahoma that are raising bonuses for this line are Mutual, Shattuck, Persimmon, Lenora and Woodward.

The St. Louis & San Francisco R. R. is to at once erect a large roundhouse in West Tulsa for the accommodation of the Enid branch of the road. A large yard will be installed in West Tulsa and the downtown yards in Tulsa will be partially abandoned.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The construction of an electric railway from Canby to Molalla is proposed and it is said that 20 miles of the line will be in operation by July 1. Later the line will be extended to Portland, crossing the river at Canby, and going by way of the west side. Already an option has been placed on the steel to cover 16 miles, engine and 60 cars, formerly used on a logging railroad. This line, in no way, will interfere with the proposed Swift Railroad, as it will pass through a different section of the county, and through some of the finest timber land. The electricity for the proposed railroad will be supplied by the Canby Canal Co.

The Pacific Railway & Navigation Co. has placed 38 miles of its new line in operation. This is considerably more than one-third of the mileage of the road, which is to be 90 miles long. Seventeen miles will be operated at the Tillamook end from Hillsboro to a station, not yet named, just beyond Buxton, the other 11 miles being at the Tillamook end of the road. Thirty-three miles of the road are completed, and 100 men are working on 27 miles. This construction is about 40 per cent completed.

Work on the first 25 miles of the Klamath-Natron cut-off is being pushed with vigor, several hundred men being now employed by the contractors, Erickson & Peterson. This division will extend from Klamath Falls to Williamson River on the Klamath reservation, and it is expected to be completed by August, 1910. Although the country is comparatively level from Klamath Falls to Williamson River, there are several miles of marsh lands along the eastern margin of Upper Klamath Lake through which a grade will be thrown up by dredging, and one large dredge weighing 210 tons, is already on the work. Another one now under construction at Oakland, Cal., said to be of twice the size and capacity of the present one, will soon be placed on the work.

The Northern Pacific Ry. is stated to have secured options on 14 blocks in the northwestern part of the city of Portland as a site for terminal yards, for which $1,962,000 will be paid. It is said that the Northern Pacific is preparing to invest at least $2,000,000 additional in property for terminal and trackage facilities in that section of Portland, with a further expenditure of as much more contemplated for improvements.

Surveys for the proposed Coos Bay, Boise & Idaho R. R. have been completed into Roseburg. Four lines were run down the eastern slope of the Coast Range and an excellent grade is stated to have been secured. The crew working toward Marshfield are also stated to have completed their work to that city.

Robert Wakefield, Portland, Ore., has been awarded the contract for constructing a 4,000 ft. jetty on the south side of Siuslaw bar for the Port of Siuslaw. The contract price is $117,000.

The Pacific City Canal Co. has been incorporated with a capital stock of $1,000,000 for the purpose of connecting Pacific City on Flores Lake in Curry county, with the Pacific Ocean by means of a deep water lock canal. The building of the new canal is estimated to cost $800,000 and the plans of the company comprehended its immediate completion, as well as the building of a 50-mile railroad, which will give the new district connection with the interior of the state. The project has been examined by engineers and pronounced feasible. The canal will have sufficient depth to admit the largest vessels in the coast trade. The incorporators are George H. Stevenson, a Portland business man; W. W. Purdy, a civil engineer formerly connected with the Great Northern Railroad, and W. H. Lang, a real estate man of Portland.

The Warren Construction Co. is building two miles of street railway at Salem, for the Portland, Eugene & Eastern Ry.

Councilman Belding of the South Portland District of Portland, has been requested to have city engineer prepare estimates on the cost of a fill at Marquam Gulch, on Second St. from Sheridan St. to Arthur St., and a fill on Corbett and Seymore Sts.

Engineers of the Oregon Railroad & Navigation Co., G. W. Boschke, Chief Engineer, Portland, Ore., have completed plans for additional sidetracks at Lagrange. The revised yard will include 11 sidetracks the full length of the yards, and 6,000 ft. of "storage" tracks. The plans also include new repair shops in the northwestern part of the yards, and the old bunkers will be replaced by coal chutes.

Construction work is stated to have been started on the Astoria, Seaside & Tillamook Ry. Co.'s proposed electric line from Astoria to Seaside. The first section of the road to be built will be from Astoria around Smith's Point to a connection with the county drawbridge across Young's Bay. F. L. Evans, Astoria, is president.

Work on the extension of the Pacific & Eastern Ry. to a point in eastern Oregon, where it will connect with the Oregon trunk line now being built through the Deschutes canyon, will be resumed shortly. The Pacific & Eastern was until last spring but a 6-mile line, from Medford to Eagle Point, but during the summer it has been extended from Eagle Point to Butte Falls, a distance of 12 miles, the fall rains stopping construction work.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Coal and Iron Co., of Shamokin, has decided to build a concrete reservoir at Bear Valley, to supply the various operations of the coal company in Shamokin, which include Bear Valley, Burnside, Sterling and Henry Clay workings. Work will be started on the reservoir in the spring.

The Philadelphia & Reading Ry. has secured land at Harrisburg far a large freight depot and distributing yard.

A New York syndicate is reported to have secured an option on the Shamokin Light & Power Co., the figure being $620,000, and are said to be trying to get an option on the plant of the Edison Illuminating Co. at Mt. Carmel. It is said that the syndicate has already secured options on the several electric railway lines that center at Sunbury, and that they are now negotiating for the Bloomsburg, Milton and Danville lines, and that they will make a bid to take over the lines of the Shamokin and Mt. Carmel Traction Co., and also those controlled by the Schuylkill Railway Co. It is said to be the purpose of the syndicate to get control of all the electric plants and railway systems in

central Pennsylvania and operate them under one system, the power to be generated at the great plant being erected at Harwood, near Hazelton and at the big dams at Muncy.

Eyre-Shoemaker, Inc., contractors, Arcade Bldg., Philadelphia, Pa., are reported to have been awarded a contract by the New York, Philadelphia & Norfolk R. R. for double tracking about 50 miles of line, the contract including widening the roadbed and bridges.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The railroad committee of Pecos is stated to have obtained the necessary subscriptions to secure the railroad from Pecos south.

The Kansas City Southern Ry. in connection with Adolphus Busch and other capitalists are said to be planning to construct a line from Shreveport, La., to Jefferson, Tex., which will be used in bringing iron ore from the Jefferson iron fields to Shreveport. It is understood that furnaces will be established. It is also understood that the road between Shreveport and Beaumont will be ballasted, heavier steel laid and the track greatly improved in a general way. A. F. Rust, Kansas City, Mo., is resident engineer.

Announcement has been made that the St. Louis & San Francisco R. R., is planning the expenditure this year of $15,000,000 for improvements and extensions. The Fort Worth & Rio Grande Ry., which is a part of the Frisco, will branch in two directions from Brady, one line entering Menardville, the other entering Comfort, meeting the S. A. P. road and giving direct connections into San Antonio and Mexico. Surveyors are already working on the Menardville line but the Comfort branch is an entirely new proposition. The St. Louis, Brownsville & Mexico road will be extended from Brownsville across the Rio Grande to Tampico, Mexico. After these improvements are completed the Marshall & East Texas road will be extended north to Paris and south to Newton, forming the final link in the Frisco's short line between St. Louis and the gulf. M. C. Byers, St. Louis, Mo., is chief engineer, St. Louis & San Francisco R. R.

The San Diego, El Paso & St. Louis R. R. has completed surveys and estimates for its line as originally projected from El Paso, Tex., to Artesia, N. Mex., a distance of 197 miles. The company is now planning to extend the line through the entire state of Texas, where it will connect with the Frisco route either at Quanah in Hardeman county or at Vernon in Wilbarger county, and as contemplated, the line will be 500 miles to Quanah or 520 miles to Vernon. The proposed route from Artesia, N. Mex., is via Knowles, N. Mex., Gaines and Yoakum counties; Brownfield, Terry county; Lynn county; Sude, Lubbock county; Emma, Crosby county; Afton, Dickens county; Motley county, Paducah, Cottle county, and thence either to Quanah in Hardeman county or to Vernon in Wilbarger county. At either of these places it will connect with the Frisco for the north or east. P. A. McCarthy, Houston, Tex., is chief engineer.

The Beaumont Traction Co. of Beaumont is stated to be planning to expend $75,000 for improvements to its present system if a satisfactory franchise can be obtained from the city.

Mayor Joseph F. Nichols of Greenville, has succeeded in interesting several parties in that city and at Wolfe City in the organization of a local corporation to build an interurban railway. The first line to be considered will be one from Greenville to Wolfe City. The proposed line will be extended from Wolfe City, possibly in the direction of Clarksville. It is also proposed to extend the line in a southwesternly direction from Greenville, possibly to Plano.

It is expected that by June the Gulf, Colorado & Santa Fe Ry. will have a 90-lb. rail on all the main line from Purcell to Galveston. This work comes under the 1909 fiscal year appropriation and much of it has already been done. The total cost will be about $700,000. The 1910 budget of the Gulf, Colorado & Santa Fe Ry. is said to contemplate expenditures of about $6,000,000—embracing various improvements to existing property and the construction of new. The erection of some 20 new depots is considered.

The Estacado & Gulf R. R. is stated to have been financed and it is said that work will begin at once to complete the road from McCauley to Roby. The road is now within four miles of Roby and material has been secured to complete this stretch of road. It is said to be the intention of W. A. Butts, Stamford, president of the road, to build at least 100 miles of road during 1910 and his plan is to build east and west. The east line to come to Stamford and the west to go to Colorado City and on toward Rosewell, N. M. Mr. Butts has asked Stamford for a proposition and the matter is now under consideration. It is known that Mr. Butts is also figuring on building his road into Abilene.

The recent visit to San Antonio of several officials of the Southern Pacific has given rise to the report in that city that the S. P. was planning to take over the Artesian Belt Ry. and build it to a point near Brownsville on the Rio Grande, and the Uvalde & Crystal City and extend that road to connect with the Laredo & Minera, at Minera.

A company is being organized by Greenville and Wolfe City capitalists for the purpose of building an interurban line between the two cities. It is hoped to have active work started this spring. Mayor Frank Nichols of Greenville is organizing the company.

The Santa Fe is said to be contemplating the expenditure of $250,000 in the building of a new round house, machine shops and turntable at Galveston.

Work has been resumed on the new rice irrigation canal being constructed on the W. C. Woods farm on Cow bayou, near Orange, which will be cultivated during the coming season. The canal has been completed for half a mile and the work will be rushed through to an early completion. L. F. Daniel, C. E., Beaumont, has charge of the engineering work on the canal. Mr. Daniel has also made surveys for an extension of the rice irrigation canal of Dr. E. W. Brown, east of Orange.

Work under the present appropriation on the U. S. Government jetties at Aransas Pass will be completed July 10, 1910. If another appropriation is made as a bill pending before congress asks, the work will be continued. Under the present appropriation 2,500 carloads of rock have been dumped into the salt water. These rocks make up the north and south jetties on which work is still in progress. These jetties extend out two miles. The present appropriation is $990,000. One hundred men are at work on the jetties. Present plans are to use the outer harbor where the water is shallower, for the smaller boats and reserve the entire inner harbor for larges vessels. The government work is exclusive of the work being carried on by the Aransas Pass Channel and Dock Co. This organization, under a state charter, is cutting a channel through Harbor Island.

The Chamber of Commerce of Wichita Falls and the citizens of Byers, have offered a bonus of $150,000 for extending a railroad from Byers to Waunika, Okla.

The Houston Lighting & Power Co., of Houston, Tex., has filed an amendment to its articles of incorporation, increasing its capital stock from $1,000,000 to $1,500,000.

The Grigsby Construction Co., Houston, Tex., is reported to have been awarded the contract for extending the Southwestern Ry. from Scotland to Archer City, a distance of ten miles.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city council of Aberdeen will call for bids shortly for filling in the tide lands west of Broadway and east of Division St. The work will involve the expenditure of many thousands of dollars.

The Chicago, Milwaukee & Puget Sound R. R. is stated to have secured right of way through Coeur d 'Alene, for its projected line to Spokane. Engineers are stated to be still in the field making estimates and securing data for the construction of the line into Spokane. The final route for the new line has not, however, been definitely decided on.

A settlement has been made outside of court whereby the Northern Pacific has secured the property of the Seattle Sand & Gravel Co., for which it has started condemnation proceedings. The property was part of the right of way for the new water grade line out of Tacoma via Point Defiance and the Narrows. A portion of the tract includes an excellent gravel pit, which is located half a mile north of Chambers creek. The consideration is said to be $165,000.

The Well's Construction Co. is making good progress with the work of straightening the Puyallup River near Puyallup, by means of cuts made through the Boatman, Lacey and Stewart properties and will probably complete the work by the end of January.

The Northern Pacific Ry. has preliminary surveys well along for shortening its main line from Spokane to Tacoma and Seattle by about 100 miles. The new line will be a continuation of the branch which is now being built from Ritzville in Adams County, to a point directly west of there on the Connell-Adrian branch. The latter joins the old Washington Central, now a branch of the Northern Pacific, at Adrian. The line from Ritzville to the intersection with the Connell-Adrian branch is 45 miles long and the present survey has been extended to the Columbia River, approximately doubling the length of the line and leaving it within 20 miles of Ellensburg where the additional survey will probably bring it in connection with the main line again.

The city council of Olympia has renewed the franchise of the Eastside Ry. Co., which operates a spur from the Northern Pacific line on Jefferson St. to the water front at Olympia. Fred Schomber is secretary.

The construction of a ship canal connecting the Chehalis River at Elma with Puget Sound in the neighborhood of Olympia is proposed. The canal as proposed will be 16 miles long and would afford a safe passageway to all deep-water vessels in the Sound region. Representatives of the Andrews Engineering Co., 120 Liberty St., New York, are stated to have been over the ground.

The Puget Sound Bridge & Dredging Co., Seattle, Wash., has been awarded the contract by the city council of Olympia for making the fill at Water St. The contract price is $83,665.

The Northern Pacific Ry. has several crews of surveyors working out of Ellensburg on the Lind cut-off. This cut-off if built will parallel the line of the Chicago, Milwaukee & Puget Sound, and will save Northern Pacific trains the present detour south to Pasco and thence north through the tortuous Yakima canyon. The new line would save about two hours in the running time between Ellensburg and Spokane, and will cut about 100 miles from the present route. The new cut-off will also make possible the double tracking of the Northern Pacific from Stampede tunnel to Spokane, a proposition already determined upon, and will make Ellensburg the principal shipping point of the fruit and grain region now tapped at North Yakima. A. C. Stoner, Ellensburg, is in charge of the surveys.

Advices from Milltown, state that farmers and business men in the lower Skagit River Valley have raised over $50,000 toward constructing a dike to be about 15 miles long and to cost $100,000. The largest and most difficult work in the whole project will be the construction of a large dam across the head of the new channel which was formed during the recent high freshet. This work alone will cost about $60,000, but, as it is expected that the federal government will take hold of this work, the local farmers are bending every effort towards the main dike.

Right of way agents for the North Coast Ry. are working west of North Yakima securing the balance of right of way, which indicates that the work on the extension to Tacoma is to be pushed as soon as the road is

built into Tacoma this winter. The located line runs up the Rattlesnake River to the Cowlitz pass, thence by two routes, one down the Cowlitz River, the other up the Cowlitz to Bear prairie and down by way of Longmire Springs. The survey runs north to Tacoma and south to Portland, the Portland line following the Cowlitz down to Olequa. Surveys have also been made running down the east side of the Cascades and thence to Portland. Engineers for the last three months have been working on another survey running up the Natchez River and through the Snoqualmie pass, following down the middle fork of the Snoqualmie to Seattle. This is said to make a better route than the Milwaukee, which takes the North fork. The fact that right of ways is being secured by way of the Cowlitz pass is taken to indicate that construction work is to be along the original survey, rather than by the newly surveyed line by way of Snoqualmie.

The Inland Empire Electric Ry. has surveys underway for an extension from Colfax. Two routes are under consideration—one up Spring flat, thence crossing Union flat to Dusty and on to Hooper; the other is the old right of way purchase to Penawawa, crossing Snake River and going up Deadman Creek into the country back of Asotin. It is also possible that extension may go to Walla Walla. A. M. Lupfer has been in Colfax directing the surveys.

Right of way for the Ritzville branch of the Cornell Northern R. R. has been secured to a junction 38 miles north of Ritzville.

Advices from Husum state that the engineers surveying the big Klickitat Canal, which is to irrigate 600,000 acres throughout the Horse Heaven country, have reached a point near Bluelight in the eastern part of the county. The surveyors have been locating a large reservoir site in Spring Canyon, two miles south of Bluelight.

Right of way is being secured in Everett for the Everett branch of the Chicago, Milwaukee & Puget Sound Ry., and it is believed that active construction work will be started in that city by March 1. Construction work elsewhere on the line has been started, and the first construction camp has been established at Moncton, a short distance from the Snoqualmie Pass. E. J. Pearson, Seattle, Wash., is chief engineer.

The Aberdeen Construction Co., of Aberdeen, has begun work on its contract for preparing the ground for the station at Aberdeen for the Grays Harbor & Puget Sound Ry., a Union Pacific line. The contract provides for the removal of the sawdust and other refuse which now fills the tract along its entire length from the Western Cooperage plant to the Anderson & Middleton mill, the building of a bulkhead and the filling of the street with solid earth.

The city council of Chehalis has granted the Twin City Light & Traction Co., a six months' extension on its electric railway franchise in that city. The Centralia Council has also granted an extension. The company is pushing work at Centralia, the contractors grading National St., the heaviest work on the route. The council ordinance provides that the line must be completed and cars running by next July.

According to reports from Nine Mile, Wash., the Big Bend Transit Co., which has been granted the right of way at the junction of the Columbia and Spokane Rivers, is contemplating the purchasing of the Spokane & British Columbia right of way and constructing a line through Nine Mile, during the following summer.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Minneapolis, St. Paul & Sault Ste Marie Ry. is reported to have purchased the Bayfield & Western, a short line on the south shore of Lake Superior, running from the city of Washburn to a point near Cornucopia in Bayfield County. The line in question is used chiefly for logging purposes although the roadbed is sufficient for use for other purposes. It is said that this is the first step in the constructing of a road from Ashland to Superior. The line built is about 25 miles long and runs to within a short distance of Cornucopia. From the latter place to Superior is about 5 miles. The proposed Soo line from Ashland to Superior would extend from Cornucopia to Port Wing and Orienta and from there on into Superior, following closely the south shore of the lake.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Lachme, Jacques Cartier & Maesonneuve Ry., a subsidiary line of the Grand Trunk Ry., has applied to the city council of Montreal for permission to extend its line through the north and east end of the city in order to provide increased terminal facilities for the Grand Trunk.

The Alberta & Great Waterways Ry. Co., W. R. Clark, president, Kansas City, Mo., has awarded the contract for ties, bridge and culvert timber for its first 100 miles of line to the McInnis Lumber Co., Edmonton, Alberta. Contracts for ties, etc., for 50 miles of the line were let to James Walker, Fort Saskatchewan.

T. E. Kaiser, W. F. Cowan, R. McLaughlin, Oshawa, Ont., and R. R. Mowbray, Kinsale, Ont., have applied to the Dominion Parliament for a charter for the Toronto Eastern Ry., which proposes to construct an electric railway from Port Hope, Ont., to Toronto.

The Pine Pass Ry. Co., with offices at Edmonton, Albert, has applied to the Dominion Parliament for articles of incorporation. The company proposes to construct a railway from Edmonton, Alta., northwesterly to the confluence of the MacLeod with the Athabasca River, thence continuing northwesterly to Pouce Coupe Prairie, and thence southwesterly to Fort George on the Fraser River, B. C. The provisional directors include A. R. Chisholm, T. W. Lines and B. J. Saunders, all of Edmonton.

Advices from Spearfish, S. Dak., state that local contractors have submitted figures on grading to the Burlington and Northwestern railroads for two proposed extensions. The Burlington extension is to the coalfield northwest of Spearfish. The Northwestern estimates are said to be on grading for an extension from Whitewood to Sundance, Wyo.

A company of local capitalists at Aberdeen, S. Dak., are to build a street railway line there as soon as spring opens. The franchise calls for the construction of six miles of railway by Dec. 31, 1910.

The construction of a railroad from Chattanooga, Tenn., to Henderson, Ky., with a possible extension to Evansville, Ind., is reported to be under consideration. George Hickson, general traffic manager of the Chattanooga Packet Co. of Chattanooga, Tenn., is said to have been investigating the probable amount of traffic for such a road.

Advices from De Funiak Springs, Fla., state that contractors have been in that city figuring on the construction of the new De Funiak Springs R. R.

The Central Construction Co. of Memphis, Tenn., has been chartered with a capital stock of $25,000, the incorporators being C. E. Terrell, H. P. Woods, C. B. Rutledge, T. A. Evans and G. T. Fitzhugh.

Announcement has been made that the Union Pacific will build a roundhouse and shops at Evanston in the spring. The main line is also to be double-tracked east and west of Evanston.

The Chesapeake & Ohio Ry. has taken over all property of the Coal River Ry. and has agreed to expend $750,000 in improvements and extensions. The Coal River Ry. has 175 miles of road. H. Pierce, Richmond, Va., engineer of construction on the Chesapeake & Ohio.

BIDS ASKED.

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

Washington, D. C.—Until 2 p. m., Jan. 25, by Department of Interior, Office of Indian Affairs, Washington, D. C., for the construction of a bridge at the Uintah and Ouray Agency, Utah.

Jacksonville, Fla.—Until 9:30 a. m., Jan. 21, by Board of County Commissioners, for furnishing all material and labor for the construction of three steel and concrete bridges. Gail L. Barnard is County Engineer.

Buckley, Ill.—Until 10 a. m., Jan. 12, by W. Strouse, Town Clerk, for the construction of the Kauffman bridge to be built on the line between Loda and Artesia townships.

Philadelphia, Pa.—Until Jan. 18, by George R. Stearns, Director, Department of Public Works, for the construction of a bridge over the Richmond Branch of the Philadelphia & Reading Ry. in line of Wissahickon Ave. The structure will be of steel beam and plate girder encased in concrete type consisting of one 60 ft. span. The roadway between curbs will be 36 ft. wide and paved with asphalt with a 12-ft. granolithic sidewalk on each side. The work will require no substructure. Plans for the bridge, which is estimated to cost $18,000 are on file at the City Hall, Room 412. All bids must be for the work complete.

Toronto, Ont., Can.—Until noon, Jan. 18, by Board of Control, Joseph Oliver, Chairman, for supplying timber piles and driving same for the bridge on the extension of Wilton Ave. over the River Don.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Hot Springs, Ark.—Until 12:30 p. m., Feb. 7, by Maj. G. D. Deshon, Constructing Quartermaster, for the construction, heating, plumbing, wiring and electric fixtures of two double sets officers' quarters at the Army and Navy General Hospital.

Storrs (P. O. Eagleville), Conn.—Until 10 a. m., Jan. 15, by Thomas D. Bradstreet, State Comptroller, Hartford, Conn., for the construction of four cottages and one dining hall at the Connecticut Agricultural College, Storrs, Conn.

Pensacola, Fla.—Until 8 a. m., Feb. 9, by Board of County Commissioners for the erection of a building to be used for court house, office building and jail. James MacGibbon is Clerk of the Board of County Commissioners.

Bloomington, Ill.—Until 5 p. m., Jan. 25, by city, for the remodeling of its water works plant, including the reconstruction and remodeling of its buildings. Official advertisement will be found elsewhere in this issue.

Emporia, Kan.—Until 3 p. m., Feb. 15 (extension of date from Jan. 14), by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for remodeling, etc., the U. S. Post Office at Emporia, Kan.

Kings Park, N. Y.—Until 3 p. m., Jan. 26, by State Commission in Lunacy, Capitol, Albany, N. Y., T. E. McGarr, Secretary, for the construction of four cottages for chronic patients, including heating, plumbing and electric work at Kings Park Hospital, Kings Park, N. Y.

Pittsburg, Pa.—Until noon, Jan. 12, by R. J. Cunningham, County Controller, for the installation and completion of the electric lighting fixtures for the Allegheny County Soldiers' Memorial.

Houston, Tex.—Until noon, Feb. 7, by Dan. C. Smith, Jr., City Controller, City Hall, for furnishing all necessary labor and material for the erection and completion of the new city auditorium. F. L. Dormant is Consulting Engineer.

Jacksonville, Tex.—Until 10 a. m., Jan. 24, by J. E. McFarland, Secretary School Board, Jacksonville, Tex., for the construction of a school building at this city.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

Birmingham, Ala.—Until 11 a. m., Jan. 19, by Maury Nicholson, City Engineer, for certain vitrified brick, asphalt, bitulithic and granitoid paving.

Dothan, Ala.—Until March 15, by W. J. Parish, County Commissioner, Gordon, Ala., for the construction of 51 miles of graded roads in Houston County.

St. Louis, Mo.—Until Jan. 21, by Board of Pubilc Improvements, for the improvement of 7 miles of streets with asphalt, brick, bitulithic and granite. The work is estimated to cost $400,000. Further information regarding the work will be found under St. Louis Items of Interest to Contractors.

The Commission Form of City Government Is Certain to Come. How Will It Affect Engineers and Contractors?

"There is no denying the fact that the government of cities is the one conspicuous failure of the United States."—The American Commonwealth, by James Bryce.

This was the verdict of the great Englishman who is credited with having written the fairest and most searching treatise on American government. Mr. Bryce reached this conclusion years in advance of the full realization of its truth by Americans themselves. Suddenly, however, the country seems to have decided that the limit of municipal misrule has been reached in nearly all the larger cities and in most of the smaller ones. As illustrating the extent of this awakening we note the fact that on January 11th every city in Illinois excepting Chicago sent a special representative to the State legislature asking for legal authority to adopt the commission form of government.

Galveston, Texas, adopted this form of government ten years ago, following the "flood" that almost destroyed the city. We quote from the Philadelphia Press:

"Galveston was destroyed in September 1900, and the people, realizing that they needed the most efficient form of government obtainable to rebuild and rehabilitate that city, created a commission government. They placed the municipal government in the hands of five men. Councils were abolished and the whole duty of legislation, levying taxes, making appropriations and administering the affairs of the city devolved on those five men and the subordinates appointed by and responsible to them. The form of government proved so satisfactory and efficient that it has been retained and has been adopted by nearly a score of other cities and towns and grows in favor as far and as wide as the people have been made familiar with it."

Des Moines, Ia., a city of 62,000 by the last census, adopted this plan a few years later in a somewhat modified form. The government of that city is placed in the hands of a mayor and four councilmen, elected by the people. The functions of those five men are analogous to the board of directors of a private corporation. The business of the city is divided into five departments, viz., Public Affairs, Accounts and Finances, Streets and Public Improvements and Public Safety, Parks and Public Property. To each department is assigned that member of the governing board best qualified by experience and ability to act as superintendent of that particular work.

Haverhill, Mass., adopted the commission form of government about a year ago. It is a city which had a population of 37,000 at the last census, and was growing rapidly. It probably has over 45,000 now, but it was troubled under its old form of government by a deficit in its revenue at the end of each year. The commission government has changed this. At the end of the first year of commission rule the treasury showed an unexpected and unappropriated balance of $40,000, which favorable showing is naturally put to the credit of the new form of government. The justice of this is challenged, however, on the ground that the efficiency of the commission government is not due to the fact that a commission governs instead of Mayor and councils, but because the commission is composed of extra good men who if placed in power would have given good government under any form of government.

The city of Haverhill could get five good men to run its government when it could not have gotten fifty such men in its service. These five men needed the power of a commission in order to make it worth their while to give their time, energy and ability to the task of managing the city government. In a legislative body they would have had to meet and overcome the inertia, indolence and ignorance of associates less capable than they. In executive authority they would have been hampered by councils and perhaps thwarted by political bosses not holding any public office. They were good men, given power and responsibility, and good results followed.

This is the experience of commission government for cities wherever it has been tried in this country. Even if it failed to come up to expectation it could not possibly be so persistent and lamentable a failure as the average city government by mayor and councils. The commission form of government is being adopted with joy in many States. The demand for it is as wide as the continent and shows no sign of abating.

We have commented editorially upon the recent adoption of a commission form of government by Boston, the first large eastern city to make any change from the time-honored "representative system." With such examples before the country it is not risking too much to predict an entire revolution in American city governments within the next five to ten years. How will this affect civil engineers and contractors?

Considering first the effect upon engineers, it is plain to be seen that many engineers will become members of the commissions that govern the cities provided they exert themselves in the slightest degree personally, and particularly if they act in bodies to secure recognition. We have repeatedly urged the importance of appointing engineers as the executive heads of the majority of city departments, for the major part of a city's work is of a civil engineering nature. The streets, the sewers, and the waterworks certainly present nothing but civil engineering problems for an executive to consider; and it is idle to talk of having engineers to act under an executive who himself is incapable of judging their ability.

The very fact that engineers are not politicians will be itself a powerful appeal for their selection as commissioners. But it devolves upon engineers to present this appeal to the public, acting as a body, just as organizations of doctors have secured the appointment of physicians on boards of health, just as organizations of teachers have, in a measure, obtained recognition on boards of education. As soon as any city adopts the commission form of government, the engineers of that city, acting as an organized body, should use every means to promote the selection of engineers as members of the commission. If they do no more than conduct a publicity campaign, they are likely to secure the selection of at least one or two engineers, and that will be a leaven at least which will work for the good of economic administra-

Copyright 1910, by the Myron C. Clark Publishing Co. All rights of republication reserved.

tion of those departments that are civil engineering in their nature.

We have spoken of economic city administration, and to some contractors this may savor of niggardly appropriations for city work. But a little thought will prove that the reverse will be true. Tax payers do not object to the spending of money wisely and honestly. In fact they have been so long used to unwise and often dishonest expenditure of public funds that a change to the commission form of government is bound to result in greater liberality in expenditures for pavements, sanitation and water supply—*for economic expenditures always pay as an investment.* Lives saved by sanitation, such as filtering water, represent a monetary gain to the community. Sickness saved from absence of microbe laden dust is likewise an economic gain. While larger loads hauled over good pavements is self-evidently a profitable result of street improvement, particularly where it is secured by means of a durable pavement.

"In twenty-five years," says a recent editorial of the Leavenworth Times, "under the old political council system, Leavenworth paved only fourteen and one-half miles of streets. This year five and one-half miles of streets are being paved. Under the old political government the city paved a little more than one-half a mile a year, although a reserve of $10,000 a month was pouring in from the saloons. Under the commission government we are paving more than five miles this year. At this rate we will pave 130 miles of street in twenty-five years, while the old political government paved fourteen and one-half miles in twenty-five years.

"Under the old system of government property owners objected to paving the streets, paving costing too much. The present system of government cannot pave the streets fast enough to please the people, for they know now they get value for their money."

It is one of the fundamental principles of political economy that if you cheapen the unit cost of production you increase the number of units consumed. So, too, money that has been wasted or stolen would have been used for actual betterments—pavements, sewers, etc.

Clearly the only contractors who can see anything but more business for themselves by the change to commission government are political-contractors. They are too few to be worthy of consideration, even if they had a worthy cause. Moreover, those very men—if they have real business ability, as many of them have—will ultimately be the gainers by this house-cleaning.

One more quotation with reference to Houston, Texas, will serve to indicate the effect of honest and economic city administration under the commission form of government:

"In the first eighteen months the commission brought the city to a cash basis, paid off a floating debt of $375,000, spent over $150,000 for new school buildings, paved with vitrified brick three important streets, Main, Milan and Liberty; paid all officers and employes in cash and paid all interest on bonds and reorganized the police and fire departments so that all departments of the city are now working harmoniously. What surprised the interested inquirer is that after the large expenditure made by the commission, they were able to reduce the tax levy for this year by ten cents on the one hundred dollar valuation."

Finally, the commission form of government will surely lead to the doing away with the day labor system, and the substitution of the more economic contract system of doing public work. Even classes of work like street cleaning and repairing, where inspection and measurement of contract work is not always easy, are pretty sure to be handled under some form of contract rather than by day labor. For, with an administration largely free from politics, it will be possible to enforce cleaning and repair contracts as well as to secure open competition in the bidding. As it now stands, many an honest contractor is often deterred from bidding on municipal work for fear he will "get the harpoon thrown into him" if he is awarded the contract.

We trust and believe that a lasting and profound reform in American city government is at hand.

The Selection and Proportion of Aggregates for Portland Cement Concrete.

The literature of concrete is very full on the important subject of proportioning the aggregates, yet we feel no apology necessary for printing in this issue an article on the subject by Mr. Albert Moyer. The idea is not at all new that maximum density means maximum strength. Many years ago concrete workers noticed that an excess of mortar was weakening and that an excess of mortar was only present in concrete made with aggregates containing a large per cent of voids. It is a condition similar to that in masonry walls with wide mortar joints.

Acting upon this discovery some of the older, shrewder men began to make void determinations and graded the aggregates. It was believed and was commonly mentioned in the older text books that broken stone fairly regular in size occupied double the space of solid stone, hence the voids were 50 per cent and this amount of sand was provided, the cement in turn being one-half the bulk of the sand. Thus came the 1:2:4 mix and in all concrete specifications the stone had to be very regular in size and the sand coarse. Concrete made 50 years ago under such specifications cannot be as dense as similarly proportioned concrete of today.

Some man found that fine gravel equal in amount to the sand would not increase the bulk of the stone, but did make a dense concrete, so we find men advocating mixtures of 1 sand, 1 fine gravel and 2 of broken stone. Believing that this was still a 1:2:4 mixture, as it actually was, the cement was still in bulk equal to half the sand. We can readily believe that in the course of time the significance of the large quantity of stone disappeared and men used a 1:3:6 proportion. Just how much cement was used no one knows. As late as 20 years ago specifications for concrete used bushels, loose, heaped and struck as well as loose barrels and packed barrels for measuring the cement. Superintendents in charge of work generally left the concrete work to the wise old foremen who had experience. Many engineers at that time discharged men who mixed "mushy" concrete, much to the astonishment of old fellows who knew by experience just how much water to use, and "sensed" density and thus proportioned the cement.

When it was realized that a little cement went a long way there was a period, from which we are now beginning to emerge, in which fancy ran riot in concrete proportioning. In a 1:2:4 mix the cement is 1-9th and in a 1:3:6 mix it is 1-10th the mass and the 4¾ per cent costs money. Lean mixtures and fat mixtures meant the percentages of cement shown on paper, whereas the voids, about which no one cared, made a tremendous difference, unknown however. When men read papers and told about mixtures of 1 to 12 and 1 to 16 they did not in all cases tell about the care exercised in filling the voids. That was a trade secret and a man who obtained a very strong concrete with an extraordinary lean mix was preferred to the man who could not do so well.

The study of scientific grading is a development of very recent years. The most ignorant concrete workers now know that it is proper to mix fine and coarse material and that good concrete is dense concrete. Much that has been written has come from laboratories and is on the face difficult to follow in reading and considered, as much of it is, almost impossible to apply on actual work. Whether all that Mr. Moyer recommends can be applied on all construction work, or even a small part of it, is of no moment. He has given in a plain understanding way a conception of concrete manufacture that will have a good effect on this industry.

The idea of a fixed arbitrary proportion will obtain for a long time. From the nature of things it must unless we add enormously to the inspection cost of work. That the fixed arbitrary proportion will give way in time to a scientific grading of materials, and quality of concrete can be assured within very small limits and that ultimately a proper method for writing specifications will come into common use to insure this desirable result no one now doubts. The importance of the subject being understood; methods to secure good results being now available in proper form to be serviceable to even the contractor on the hurried construction, a specification is needed. An opportunity is offered for some engineer to clothe the idea in proper words so that the fixed arbitrary proportion will disappear and the concrete of maximum density be required hereafter on all work. Some men are now doing it on their own work in a more or less crude way, but the practical worker for whom specifications are written positively requires specifications as a part of his instruction in his business.

The Library of Congress at Washington, D. C., is now probably the third largest collection of books in the world, passed only by the British Museum in London and the Bibliotheque Nationale at Paris. During the fiscal year ending July 1, 1909, 167,677 volumes were added, making the total number in the library 1,702,685. The collection of maps and charts now numbers 111,343, the music collection comprises 501,293 volumes and pieces, and the statistics of the prints division show 303,036 pieces.

John W. Alvord, President Western Society of Engineers.

John Watson Alvord, hydraulic and sanitary engineer of Chicago, recently elected president Western Society of Engineers, was born Jan. 25, 1861, at Newton Center (Boston) Mass. He was the son of the Rev. John Watson Alvord and Myrtilla (Peck) Alvord. The Alvord family came originally from Somersetshire, England, ancestors arriving in this country in 1630-35, settling at Windsor, Conn., and later at Northampton, Mass., where several generations lived. Branches of the family removed to Easthampton, Conn., where Mr. Alvord's father was born.

The family removed to Washington, D. C., at the close of the war in 1866. The subject of this sketch was educated in private schools and prepared for Sheffield scientific school at Yale in 1877, but was prevented from entering by poor health. A year as a law student in New York city, followed by two years of practical railroad work in Colorado, preceded his commencement of engineering work in Chicago, January, 1880, in the office of John A. Cole, C. E.

The first work of importance upon which Mr. Alvord was engaged (as assistant engineer) was the extension of the sewer system of the Hyde Park district of Chicago and the new water-works built there in 1882-3. This work involved the construction of an inlet tunnel under Lake Michigan a mile in length. Later work included the laying out and improving of such suburbs as Edgewater and Buena Park and general surveying. In 1883 he had charge of the large trunk sewers in the Hyde Park and Lake View districts of Chicago.

In 1884 Mr. Alvord was appointed city engineer of Lake View (now Chicago) and held that office for four years, during which time he remodeled and extended the Lake View water-works to about fourfold its original capacity. He also had charge of many miles of street paving, lake shore protection and sewer work, and organized the methods and records of an office that cared for a total expenditure of about $2,500,000 during the four years he held office.

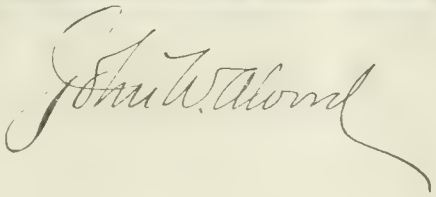
After the annexation of Lake View to Chicago in 1888, Mr. Alvord spent nearly a year in Europe examining public works and collecting data on water supply, sewerage and sewage and water purification. In 1889 he was appointed town engineer of Cicero, west and adjacent to Chicago, where he designed a system of main drainage comprising about 380 miles of sewers, much of which has since been built. He also superintended some 40 miles of street improvement and was consulted at this time on water-works matters by Duluth, Minn., Muskegon, Mich., Hurley, Wis., and Ironwood, Mich.

In 1890 Mr. Alvord was appointed chief of an engineering department of the world's Columbian exposition at Chicago, having for three years charge of the dredging, grading and filling of the grounds and the construction of roads, surveys and grades. At the dedication ceremonies he was presented with one of the seventy medals received by the designers of the fair.

During 1892-3 he was chief engineer of a water supply conduit 92 miles long from Waukesha to the world's fair grounds for supplying refrigerated drinking water. At the close of the fair he assisted in compiling the report of the director of works.

In 1894 Mr. Alvord again visited England and the continent and broadened further his information on foreign engineering works. Returning home he opened an office in 1895 for the general practice of his profession in the especial lines in which he has been actively engaged ever since.

From 1897 to 1901 he was consulting engineer to the commissioners of the Illinois and Michigan Canal, conducting important litigation and advising on the construction of large hydraulic works at Joliet and reporting on



various hydraulic powers belonging to the state of Illinois.

In 1899 he was retained by the city of Columbus, Ohio, as consulting engineer on sewer problems, designing a system of 75 miles of sanitary sewers for that city since constructed; also reporting on the sewage purification problem.

In 1905 he was entrusted by the United States Steel Corporation with the design and construction of the sewerage and water supply of its new steel city at Gary, Ind. This work occupied three years, cost about $1,500,000, and involved a 3-mile inlet tunnel under Lake Michigan, a pumping station of 20,000,000 gals. daily capacity, 25 miles of water distribution system and over 25 miles of trunk and local sewers with ultimate designs for sewage purification works.

In 1907 he was engaged by the city of Evansville, Ind., to advise and superintend the erection of a mechanical filtration plant of 12,000,000 gals. daily capacity on quite difficult foundations; also a low lift pumping plant and interesting foundation problems for the repair of the original pumping station.

Of late years Mr. Alvord has acted as consulting engineer on water-works problems for the cities of Grand Rapids, Mich.; Rock Island, Ill.; Cedar Rapids, Ia.; Terre Haute, Ind.; Council Bluffs, Ia.; St. Louis, Mo.; the city of Chicago, the Union Stock Yards of Chicago, Evansville, Ind.; Des Moines, Ia.; Gary, Ind.; Racine and Kenosha, Wis.; Davenport, Ia.; water works, Norway, Mich.; Bloomington, Ind.; Manistee, Mich.; Winona, Minn., and many other smaller cities.

Mr. Alvord has made many valuations of water works properties as member of boards of appraisers or by testifying as expert in court. Among the cities and water companies he has served in this manner are: Omaha, Neb.; Mobile, Ala.; Sheboygan, Wis.; Flint, Mich.; Knoxville, Tenn.; Dubuque, Ia.; Fergus Falls, Minn.; Fort Smith, Ark.; Valparaiso, Ind.; Des Moines, Ia.; Waterville, Me.; Quincy and Peoria, Ill., and other places.

Mr. Alvord has made a special study of sewerage work and has designed sewer systems for upwards of 75 municipalities. In many cities he has, in addition, constructed sewage disposal plants which have successfully purified the wastes of these communities. Some 20 cities have adopted this system under his advice.

Mr. Alvord has also been often called upon to report on water power projects both from the economic and engineering standpoint. He reconstructed the dam and water power at Des Moines, Ia., and has investigated river flow and water power at numerous places, and has been retained as expert in many cases of flood litigation.

Mr. Alvord is a member of the American Society of Civil Engineers, past first vice-president of the Western Society of Engineers, first vice-president (1909) of the American Water Works Association, member of the New England Water Works Association, the Central States Water Works Association, the Illinois Water Supply Association, the American Society of Municipal Improvements, past president (two terms) of the Illinois Society of Engineers, member of the American Public Health Association, the American Association for Advancement of Science and the American Academy of Political and Social Science.

Mr. Alvord is the author of a number of professional papers contributed from time to time to the societies of which he is a member. The more important of these deal with the subject of sewage purification and the economics of valuation. In 1902 he received the Chanute medal of the Western Society of Engineers for his paper on "Sewage Purification Plans."

Mr. Alvord resides at 5203 Hibbard avenue, Hyde Park, Chicago, and has his office in the Hartford building, corner Madison and Dearborn streets. He is locally a member of the Chicago Engineers' Club, the City Club, the Chicago Y. M. C. A. and the Hyde Park Presbyterian church. He married September 4, 1889, Helen C. Cornell of Chicago.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Economical Selection and Proportion of Aggregates for Portland Cement Concrete.

BY ALBERT MOYER.

The object of this article is to give a practical method which will enable any concrete constructor to make economical use of the best aggregates, so proportioning them as to give the maximum strength and density with a minimum amount of cement. Concrete under discussion is plain and not reinforced, for reinforced concrete, an over-cemented mixture, is sometimes necessary, particularly in column construction.

There is a theory that the strength of concrete depends entirely on the adhesion of the cement to the sand and stone. The writer cannot see any tangible reason for this theory as applied to compression strength, for which concrete is designed. Eliminating tensile strength from the mind, it would be possible to make a concrete with a hardening noncementing material, which could be poured in between the particles of sand and stone so as to fill the voids. While this material would not adhere to the sand or stone, it binds around each particle and thus not only furnishes an arch action, but by its own strength keeps the mass from spreading. Portland cement not only binds around, but also adheres to each particle of the aggregate. Therefore maximum density is maximum strength in a well balanced concrete of the best materials.

The ideal or theoretically perfect concrete is that in which the best aggregates are scientifically proportioned and graded in size so as to reduce the percentage of voids to the minimum giving the greatest density. It is theoretically possible to so grade the aggregates in regular progression from 2 to 3 in. stone down to distinct pieces the size of dust, so that the voids of each progressive volume are filled with the largest size particles that will fit them. Thus a minimum of cement will give a stronger concrete in compression than could be obtained with a larger percentage of cement, using same quality of sand and stone, but not properly graded in size.

The ideal and practical, however, are entirely different matters. What the practical user of cement needs is practical information and not a mass of theories which obscure the vision and make it difficult for the "man in the field" to see the few simple laws and underlying principles which, if kept constantly in view, will lead to the best results.

Concrete should be considered as a whole, a definite material designed to meet the requirements of the particular work it has to perform; however, in order to intelligently consider concrete as a whole, we must analyze the function of each of the aggregates.

SELECTION OF THE LARGER AGGREGATES.

In discussing the selection of aggregates, I will first deal with the larger size, for the reason that in proportioning the ingredients it is first necessary to measure the voids existing in any given quantity of the largest particles, so as to determine the quantity of mortar necessary to fill these voids. After selecting the best stone or gravel economically obtained in the particular locality in which the work is to be done, the next thought is the grading of this material so as to obtain maximum density, thus reducing the voids and consequently the amount of mortar required to furnish the bond.

As the value of broken stone depends on several conditions, the following classification, read in the order in which they are stated, must be taken merely as a guide: Trap, quartz gravel, limestone (hard), granite, marble, limestone (soft), slag, sandstone, slate, shale and cinders. (N. B.—Poor grades of schist and all micaceous stone should not be used.) Among the conditions which must be taken into consideration are toughness and hardness as being better than stone which may be of a higher classification, but which is more easily fractured. The importance of toughness and hardness as related to strength, increases with the age of the concrete.

The purpose for which the concrete is intended must always influence the selection. For a very strong concrete, a hard stone without any surface scale is necessary; a richer mortar will not entirely counterbalance a deficiency in the strength of the stone. For a medium strong concrete the hardest stone need not be insisted upon, but rather one to which the mortar will best adhere, such as some of the limestones. For fireproof construction some of the limestones and rocks containing feldspar should be avoided; good boiler furnace cinders have proved best for fire-resisting concrete.

For all classes of concrete, stone breaking in cubical form is far better than one breaking in flat layers such as shale or slate, it being almost impossible to ram or tamp such stone into as dense and compact a mass as that breaking in cubical fracture.

The size of the stone aggregates depends on the purpose for which the concrete is to be used. For large masses of concrete, 2½-in. stone is usually considered the maximum size, but for 12-in. walls and the usual class of concrete construction, ¾-in. will be found sufficiently large. In considering the selection of broken stone, it must be borne in mind that screenings, quarry tailings, etc., in crushed stone, are not a detriment, as is commonly supposed, but in fact a decided advantage, for the reason that the voids are thus reduced, giving greater density and consequently greater strength; each particle is proportionately as strong as the largest piece of stone from which it came, unless stunned in crushing, as might occur in granite and sandstones. When screenings are used as a portion of the larger aggregates in concrete, the (1-100 or less) dust should not be in excess of 10 per cent of the volume of screenings, which will pass a ¼-in. mesh, as the dust is apt to coat the stone so that the mortar does not come as readily in direct contact with the larger pieces of stone. If the mortar does happen to reach every portion of the surface of the larger aggregates, it is from necessity made less rich by the dust; therefore, dust and other particles which will pass through a ¼ or ⅛-in. mesh should be screened out and used as part of the mortar. This, however, is largely a matter of very careful and thorough mixing. If mixed thoroughly the stone dust becomes incorporated in the mortar. Therefore, the mortar will adhere as readily to the stone as if the dust were not present. However, the mortar is weakened, and for this reason in making test as to the quantity of stone to be used, the dust should be screened out and figured as part of the mortar, which question will be treated later.

Material which is foreign to the stone, such as vegetable mold, scale, or loam, which cling to the surface, will reduce the strength of the concrete. This again is largely a question of careful and thorough mixing. Numerous tests conducted during the last several years by competent engineers have shown that clay in small proportions not over 15 per cent, when well mixed in the mortar, does not reduce the strength of the concrete; in fact, tests have shown that the strength has been increased. This applies particularly to the leaner mixtures. If carefully mixed, therefore, the clay will not cling to the stone, but will become part of the mortar, and in testing for proportions of stone, sand and cement, the amount of clay present should be figured as part of the mortar and not as part of the stone.

Gravel is often superior to broken stone, being usually found graded from coarse to fine; the roundness of the pebbles lends aid to compactness. It is not likely to bridge and leave holes in the concrete. The percentage of voids is usually less than in broken stone; the quartz pebbles are harder, stronger and less liable to fracture. In this discussion quartz pebbles or other very hard pebbles are referred to; sand stone pebbles are not considered as good as the better grades of crushed stone. The usual argument against gravel is that the mortar is not supposed to adhere as well to the surface as to that of freshly broken stone. This is one of the theories which is practically due to the appearance of the surface to the eye or touch; the adhesion of mortar to limestone of a smooth surface may be far greater than to sandstone or rougher materials. If roughness were the only requirement for adhesion it would seem impossible to cement together two pieces of glass.

From the standpoint of durability, gravel must be superior to stone for the reason that, by the laws of the survival of fittest and by process of elimination, nature has supplied us with the most durable. Short time tests for compression strength usually show broken stone concrete to be superior, but long time tests of from six months to a year show gravel concrete on an average to be equal if not stronger. In construction work where tensile or other stresses are to be cared for, as may occur in reinforced concrete, crushed gravel should be used. The cement will adhere more readily to crushed than to the rounded, polished surface of the gravel.

There is much more to be said on the subject of the selection of the larger aggregates, but the writer believes that the ground has been covered sufficiently for practical purposes.

MORTAR FOR CONCRETE.

Mortar for concrete is composed of Portland cement and sand (preferably coarse, but graded in size), or other fine materials, such as crushed stone, all of which will pass a ¼-in. sieve. Considering the mortar, we have to keep in view the purpose to which the concrete, as a whole, is to be put, so as to judge the necessary strength of the mortar.

It is possible to determine the voids in the larger aggregates, but in the matter of sand for mortar, such a method is practically useless, owing to the variable conditions surrounding the use of sand. However, the writer will endeavor later on in this article to describe a means whereby the quantity of cement required for mortar can be determined.

In the selection of screenings of quarry tailings, these materials should be from hard, tough stone and free from mica, loam, peaty matter, decayed particles and scale. If used as the entire aggregate for mortar without addition of any sand, 33 per cent of dust has given good results, as is demonstrated in the manufacture of architectural cement stone, which is now being made in considerable quantities by the use of sand moulds. Lime stone screenings graded in size from ¼-in. to fine dust have in numerous instances given greater strength than has mortar made of the same quantity of the best sand. It will also be found that the resulting mortar is denser than a sand mortar, and thus better for waterproofing purposes.

The character of the particles, whether they be flat, cubical or round in the matter of quarry tailings, has little to do with the dense mortar which is obtained by their use. That the mortar is dense is a practical fact, and

1123 Broadway Building, New York City.

as this paper is not a theoretical treatise, I do not feel called upon to go deeply into the theory which will explain these results, excepting briefly to outline that the density depends on the proper graduation in size of the particles and the percentage of very fine particles and dust present.

In the densest sand mortar obtainable, the crystallization of the cement which binds together these grains still leaves minute spaces between the crystals, no matter what percentage of cement was used. It is altogether probable that in the case of quarry tailings these minute spaces are filled with particles of dust. There can be no reasonable doubt that with the best material the densest concrete will be the strongest under compression. This idea can be readily grasped if you will eliminate tensile strength from your mind, as concrete is designed almost entirely for compression.

It so happens, however, that quarry tailings or screenings from the best crushed stone when made into briquettes for tensile strength tests will show far greater tensile strength in long periods than will the best quality of sand mixed in the same proportions. The writer has in his possession a broken briquette made of one part Portland cement, 2½ parts quarry tailings which contained 33 per cent of fine dust, which briquette in two years' time broke at 1,000 lbs. per sq. in.

We now come to the selection of sand. The value of sand for concrete mortar depends largely on its coarseness, graduation in size of the grains and cleanliness. Fine sand contains more voids, more surfaces to coat, and requires more cement and water than coarse sand.

The sharpness of the grains of sand has little to do with its value. It has commonly been supposed that sand should be sharp. This, however, is one of the theories which has been exploded. The writer has never seen any tangible reason for such theory. In fact, there are many arguments in favor of coarse, round grain sand. Compactness is what is desired, giving density to the mortar; round grains compact more readily than sharp grains, and the cement will cling to the surface of round grains as well as sharp grains, the character of the surface being identical. Sharp sand is only of value as indicating a silicious sand.

Good sand cannot be easily defined, or an inflexible specification written, as sands of various properties may make equally good concrete. All things being equal, a coarse sand containing a large percentage of coarse particles is far superior to a fine sand in which few coarse particles are present. Sand test for coarseness should be as rigidly enforced as the cement test. The full strength of any cement cannot be developed with a sand, all the particles of which are fine, or so fine as to all pass through a 16 or 20 mesh sieve.

The best sand is that which, when mixed with cement and water in the required proportions by weight, produces the least volume of mortar. Economy can be practiced in the matter of the selection of sand. It will nearly always pay the concrete constructor to haul sand even from a considerable distance, paying a higher price, provided he cannot get a sand in the immediate locality of the work, which sand is so graduated in size of grains as to give the greatest density.

As a means of determining the best sand for use in any given mortar, it will be well to experiment as to a mixture of two or more sands which will give the desired results. Cement should be mixed with the sand so as to provide conditions similar to actual work, for the reason that cement acts as a lubricant, allowing greater compactness than could be obtained with sand alone. The following method will be found far more accurate than that of void determination, and is practical, as it more nearly approximates the conditions surrounding the use of such sand in actual work.

Provide two or more glass graduates, each containing from 200 to 250 c. c., the glass graduates to be about 1½ to 2 ins. in diameter. Select several samples of sand, one a coarse sand, another a medium sand and another a fine sand. Wet each of the samples of sand so that the consistency when squeezed in the hand will cause the sand to hold its form without there being any appreciable excess of water, so that each sample of sand, while containing necessarily various percentages of water, will be about the same consistency. Take 70 c. c. of the coarse and mix 30 c. c. of the fine sand. Weigh 1.609 ozs., or 1 oz. 266.8 grs. of cement. This will give you approximately a mixture of 1 part cement to 3 parts sand. Mix the cement with the sand, add sufficient water to bring the sample to the consistency as is usually used by brick or stone masons, and note carefully if the mortar works smooth and is reasonably free from air bubbles. Place this in the graduated glass, little by little, tamp slightly, a little at a time. After your entire sample has been placed in the glass, note the volume as is read on the scale.

Mix the second sample, using 50 c. c. of the coarse sand, 30 c. c. of the medium sand and 20 c. c. of the fine sand, add same quantity of cement as before, mix with water as before, place in graduated glass and note the volume. Make several samples, using different proportions of the different size grains of sands, always using the same total quantity of sand (100 c. c.) and cement (1.609 oz.) in the mixed mortar; the sand which produces the least volume of mortar will be the best to use. The proportion of cement to be added to this selected sand to give the best results required by the character of work to be done will be described later.

To determine cleanliness, take a sample of sand, pour some clean water into a glass, pour a little sand in at the time. If the water become muddy, the sand may contain loam, peaty matter and decayed particles. It is also well to ascertain whether the murky condition of the water is caused by the presence of clay. If so, the sand should not be rejected, provided the clay is not in excess of 15 per cent of the volume of the sand, it having been shown by numerous tests that clay is not a detriment when in small proportions. Ground, well burned terra cotta or brick, all of which will pass a ¼-in. mesh sieve, may be used with sand or screenings without appreciably reducing the strength of the mortar.

SELECTION OF PORTLAND CEMENT.

Now comes the most important ingredient in concrete, Portland cement, as it is this material which forms the bond. The other aggregates being usually stronger, upon the uniform strength of the cement depends the strength of the concrete. The selection of stone, screenings, slag, cinders, sand or other ingredients can be determined often by sight or touch, or at least by simple tests. They are well known and have definite requirements; not so with Portland cement. Tests require experts of some years' experience; the results of known laboratory tests are merely a guide from which deductions may be made only by the best scientific understanding available. Owing to the variable conditions surrounding such tests, the results cannot be absolute. Specifications as to numerous tests to which the cement shall be submitted before passing inspection furnish a check or guide as to the quality, but there is as yet no specification which has come under the writer's observation which could not be complied with by shrewd manufacturers substituting an adulterated product.

Each manufacturer exploits his particular brand as the best cement, some claiming extraordinary fine grinding the criterion, others larger bulk per barrel, others low lime content, others coarse grinding (such as a prominent German brand), others high lime content and hard burned clinkers, etc., etc., and all of them claim the strongest by test, which claims they support by various published test sheets.

In order to select the best grade of cement for very important work, the engineer or constructor should specify the requirements of the standard specifications as adopted by American Society for Testing Materials. He should then select for purchase the brand that is produced by manufacturers of experience and reputation, as ascertained from engineers, not one but a number, their experience extending over at least five years with several of the well known brands. Having selected one or more brands of the best reputation, he can hold as check against errors or mistakes in manufacture the test described by the specifications above referred to. The brand purchased will necessarily not be the cheapest, but results will undoubtedly prove such brands to be more economical, as less cement may with safety be used, that of the universally best reputation is more liable to be uniform and would not require the same factor of safety. The strength of a concrete beam is limited by the strength of its weakest part. Two bags of inferior cement may jeopardize an entire floor. This method of selecting Portland cement always gives the user the best material obtainable at the fairest price, making it to the advantage of the manufacturers to produce for the engineer's interest, also offering an incentive to the manufacturer to produce the best product at all times, making improvement as science advances.

CORRECT PROPORTION OF AGGREGATES.

I have now described as briefly as possible the requirements of the ingredients entering into good concrete. The proper proportion of these ingredients, or aggregates, will now be considered. First in order are the larger aggregates. Having selected the available stone or gravel best adapted for the character of construction desired, it is necessary to determine the voids or spaces between the stones, in order to ascertain the quantity of mortar required to bond together the stone or gravel, at the same time furnishing a maximum density with a mininmum amount of mortar. Table I, if followed accurately, will be a simple method of furnishing this information:

TABLE I.—PERCENTAGE OF VOIDS.

Make a box of such dimensions as will contain 3 cu. ft. (1x1½x2 ft.). Dry the stone or gravel, heated over 212° F. Throw stone in box loose, small quantity at a time; level off top with straight edge. Having first weighed the box, weigh the box when filled, deduct the weight of the empty box from the gross weight and divide the net weight (which is the weight of the contents) by 3, which will give the actual weight of one cubic foot. Apply following table:

Weight per cu. ft.-lbs	Gravel.	Sandstone.	Limestone, medium soft.	Limestone, medium hard; Sandstone hard.	Granite, Blue stone, Limestone hard.	Granite hard, Trap medium.	Trap hard.
70	57	53	55	57	59	60	61
75	54	50	52	54	55	57	59
80	51	47	49	51	52	54	56
85	48	43	45	48	50	51	53
90	45	40	42	45	47	48	50
95	42	37	39	41	44	46	47
100	39	33	36	38	41	43	45
105	36	30	33	35	38	40	42
110	33	26	29	32	35	37	39
115	30	23	26	29	32	34	36
120	27	20	23	26	29	31	34
125	24	16	20	23	26	28	31
130	20	13	17	20	23	26	28
135	17	10	13	17	20	23	25
140	14	6	10	14	17	20	23

Before ascertaining voids in stones containing screenings and in gravel containing sand, dry by heating, screen out all the particles which will pass through a ¼-in. mesh sieve. Such particles should be figured as a portion of the mortar, which will be treated later. Having obtained the percentage of voids in the larger aggregates, the proportion of mortar necessary to fill these voids is thus known. The stone having been measured loose, you are figuring on a slight percentage of voids more than would be actual in tamped concrete, due to lubrication of the stone by the mortar and by compaction in tamping. You will thus have a little more mortar than is required to fill the actual voids. This, however, is necessary to offset any unevenness in mixing.

The quantity of mortar having been deter-

mined, the most difficult problem of all now confronts us, that of obtaining the proper proportion of cement to sand or other finer particles which will give the maximum density and strength, with the minimum amount of cement, so proportioned as to give the volume of mortar required. Many have supposed that by ascertaining the voids in the sand the quantity of cement is thus definitely stated. This is not so; in fact, an attempt to apply the voids in sand to the quantity of cement required will prove misleading. There are a number of conditions surrounding and affecting sand which will make the available voids in the same sand vary to such an extent as to make such a method useless. When moisture is added to sand and the sand mixed, it swells in volume. Thus we have more voids in a cubic foot of damp sand than we have in a cubic foot of dry sand. At the same time, the available voids in the damp sand are different from the available voids in the dry sand. Fine sand takes up more water than coarse, and swells in volume considerably more. Again, water added to cement so as to form a thick paste reduces the volume. A cubic foot of packed cement will not always make a cubic foot of paste.

The formation of mortar by mixing sand or other finer aggregates with cement will now be described. This is best done by test, not as to voids, but as to the density and plasticity of the mortar produced by certain proportions of cement to sand.

The writer's object is to make practical and easy tests of the material at hand. Tests to be made in such manner as to approximate as nearly as possible the conditions which will exist in actual work. Having studied over various methods of obtaining these desired results, I have found that most of the methods are not practical to the average concrete constructor or the "man in the field," to whom this information is of the most value.

Provide two or more graduated glasses 1½ ins. in diameter containing 100 c. c. or over, and scales which will weigh 8 ozs. to 1-64 ozs. (or ounces or grains) (or ounces and tenths). In proportioning mortar for actual work, it is convenient to assume 95 lbs. (one bag) of Portland cement as representing 1 cu. ft. in volume when packed. Therefore, in making test samples to determine the percentage of cement to a given quality of sand which will give the required density or strength of mortar, the Table II is provided, which gives the same relation of weight of cement to 1 c. c. in volume packed, as 95 lbs. is to 1 cu. ft. of cement packed. It will therefore make no difference whether 95 lbs. is actually 1 cu. ft. or not. More accurate results can be obtained by weighing the cement than by measuring. At times you would shake the cement in the graduated glass to a greater density, or tamp it to a greater compactness than you might at others.

On the assumption that: One cubic foot of Portland cement packed weighs 95 lbs., then any number of cubic centimeters will weigh the amounts given in Table II.

TABLE II.

1.....		23.5 grs.	= 3-64 approx.	=0.047
[illegible]		[illegible]	[illegible]	[illegible]
15.....		352. grs.	=52-64 approx.	=0.813
20.....	1 oz.	32. grs.	1= 5-64 approx.	=1.078
25.....	1 oz.	149.5 grs.	1=22-64 approx.	=1.344
30.....	1 oz.	266.8 grs.	1=39-64 approx.	=1.609
40.....	2 oz.	64.1 grs.	2=10-64 approx.	=2.156
50.....	2 oz.	298.9 grs.	2=44-64 approx.	=2.688

Measure out 50 c. c. of the sand you intend using, the sand to be moist so that when squeezed in the hand it will hold its form without pressing out any excess water. The sand in this condition to be then placed a little at the time in a 1½-in. graduated tube, divided off into cubic centimeters. Tamp each lot as it is placed in the tube with a stick having a flat end about 1 in. in diameter. Having thus measured 50 c. c., empty the sand out on a piece of paper or a small cardboard box or other convenient receptacle. Make several such samples, five should be sufficient. Be careful to get all the sand out of the glass tube. Estimate from the character of the sand as to about the quantity of cement which would be required to make a mortar of the desired plasticity, density or strength.

We will suppose your estimate is 1 part cement, 2 parts sand; you must then add to the first sample 25 c. c. of cement by weight (see Table II). To the second sample, 1 part cement, 2½ parts sand, and so on. After each sample has been measured out and the cement mixed with the sand thoroughly, add sufficient water to make a mortar of about the consistency in which it will be used in concrete. Now experiment with each sample, thus mixed separately, by placing a little at a time in the graduated glass; tamp with a flat end stick as before. Note the space occupied by each sample. If the total quantity of any one sample proves to be more than the volume of the sand alone, that is, 50 c. c., it is probable that you have added too much cement. If the next sample containing less cement does not increase the total volume of mortar, you will then know that the first sample did contain too much cement; therefore, for a dense mortar use the sample containing the most cement, which appears to be just short of causing an increase in the volume of the mortar. If the concrete does not require a very dense or strong mortar, you can use the proportions as determined in one of the samples containing the least cement, but which shows sufficient plasticity of mortar to give a good bond in the concrete.

The cement having been measured in each instance and the quantity noted for each sample, you are thus in possession of the proportions required for a mortar which will be used in actual work (the unit for measurement of cement being 95 lbs. one bag). For instance, if the work requires a very dense concrete, almost impervious to water, and you find that the sample to which was added 1 part cement to 2½ parts sand is that which is just short of increasing the volume of mortar in your graduated tube, your proportions for the actual work are 95 lbs., or 1 bag of cement, to 2½ cu. ft. of sand measured in the condition as it came from the bank. The sand should be measured so as to approximate the condition in which it will be found when in place in concrete; that is, as to compactness and the moisture which it would naturally absorb. It therefore will be found best to measure sand in the conditions found in the bank, and shake it down while measuring, as when placed in concrete it will be tamped, and in very wet concrete it will settle as tightly as if tamped. If this is impracticable owing to the sand having dried out, you might make a test in a length of sewer pipe. Proceed by wetting the sand to about the same consistency as was used in the sample; then measure in the pipe and compare it with the same quantity when measured fairly dry. If the bulk has been increased by the addition of moisture, then you can use less of the fairly dry by not quite filling your measuring box. When reasonable doubt exists, make sure that your proportions of mortar will not be increased by the addition of water and cement to the sand by carrying these experiments along a little further, actually mixing up a small batch of mortar in the determined proportions, use same quantity of sand as previously measured in the sewer pipe; tamp same in the pipe and note whether the volume is greater than the volume of sand used, for it may be that while the addition of moisture will show an increased volume in the sand, this may not take place when the cement is mixed with the sand, owing to the cement acting as a lubricant and causing the mortar to compact under tamping to a greater extent than would the sand alone.

In the matter of screenings or quarry tailings for mortar, all of which will pass through a ¼-in. sieve, you may obtain an approximately fair proportion of cement to quarry tailings by applying the same methods as described above, with the exception that a larger diameter glass graduate must be used, and it will not be necessary to moisten or wet the screenings. When measuring the screenings alone in the graduated glass, measure dry, add cement to each sample, then mix with sufficient water to make a plastic mass, and proceed the same as in determining the proportions to be applied to the sand.

The architect, engineer or concrete constructor is now in possession of the proportions of cement to sand or screenings for the mortar required by the character of work to be done, also the volume of mortar required to fill the voids in the stone or larger aggregate. By the method pursued the relation of weight to volume of cement is constant; the figures given are based on 95 lbs. of cement being equivalent to 1 cu. ft.; therefore, it makes no difference whether this be actual or not, for the reason that in determining the proportion of cement to sand the weights given in Table II are based on 95 lbs. being equivalent to 1 cu. ft. Thus the variations in different brands of cement are automatically cared for, provided the same brand is used to determine proportions in mortar as will be used in actual work. With these volumes definitely known, the correct relative proportion of cement, sand and stone may be figured, but as a convenience the writer has compiled Table III.

TABLE III.—SHOWING PROPORTION OF AGGREGATES WHICH WILL GIVE MAXIMUM DENSITY WITH A MINIMUM OF CEMENT. PROPORTION OF CEMENT TO SAND HAVING BEEN DETERMINED BY TEST AS DESCRIBED PREVIOUSLY; VOIDS IN STONE HAVING BEEN ASCERTAINED BY METHOD EXPLAINED BEFORE.

(The unit for measurement being 95 lbs. (1 bag) of Portland cement as being equivalent to 1 cubic foot. Proportions of mortar expressed 1 part cement: parts sand (1:3), etc.)

Voids in stone	Proportions of Stone expressed in cubic feet. Proportions of Mortar.									
%	1:1	1:2	1:2½	1:3	1:3½	1:4	1:4½	1:5	1:5½	1:6
20	5	10	12½	15	17½	20	22½	25	27½	30

Illustration.—The best stone obtainable being a hard lime stone, which has been selected crushed in sizes of, say, 1 in., ¾ in., ½ in. and ¼ in. These sizes mixed together are found to weigh 120 lbs. per cu. ft. (see Table I), voids are therefore 29 per cent. The available sand in locality requires (by test) 1 part cement, 2½ parts sand to meet the requirements of the character of work to be done, but by purchasing a sufficient quantity of coarse sand at a point distant to mix with the local sand, a far greater density results; which mixture allows a proportion of 1 part cement to 4 parts sand; therefore, the relative proportion giving maximum density as per above table will be 1 part (95 lbs.) cement, 4 cu. ft. of sand, 13¾ cu. ft. of stone. As there may be conditions due to character or size of particles of stone and sand which affect the volume, hence density of the whole, it might be well when a reasonable doubt exists to apply same method to the stone with

sand and cement added in the determined proportion as was applied in determining a mixture of two or more sands and the proportion of cement to sand. To test the total mixture of all the ingredients use a piece of 8 or 12-in. sewer pipe, mix wet and tamp, making several test samples. Note proportion of stone used in each sample, use that containing the largest amount of stone which is just short of increasing the volume of concrete. The proportion of cement to sand remains the same, the proportion having been accurately determined by test in the glass tube.

It is altogether a reasonable proposition to state that these proportions made of selected ingredients above described produce a concrete which is actually stronger and more dense than if the concrete had been made of unselected local aggregates. And also allows an immense saving in cement.

The method above described of proportioning the aggregates as opposed to the usual practice of specifying arbitrary proportions regardless of the character of the available ingredients or of the work to be done, has the advantage of offering an incentive to good workmanship. While the aggregates may in some instances prove more expensive, the resulting concrete actually costs less per yard. With expensive aggregates the contractor and foreman will take less chances of waste, and therefore exert more care in mixing and in placing. Arbitrary specifications written by the architect or engineer, which simply state good sand and stone shall be used together with Portland cement, meeting certain tests, mixed in proportions of 1:2:4 or 1:3:6, as the case may be, may mean a very rich concrete, or again may result in a very lean mixture. Supposing the only available aggregates which can be used in the locality in which the work is to be done proves to be a stone breaking in flat layers which does not compact so as to give less than 52 per cent in voids, a 1:2:4 mixture would not give the maximum density; it would be too lean. Then again the aggregates may prove to be a very good grade of stone, which are crushed ¾-in. sizes, well graded down to particles which are just short of passing a ¼-in. mesh, and the voids are found to be 30 per cent, your mixture is then entirely too rich. These two propositions are sufficient to illustrate the fallacy of arbitrary proportions.

Specifications should read—best aggregates must be used, graded in size and so proportioned as to give maximum density. Samples of the aggregates to be used must be submitted to the engineer or architect before bids will be accepted. Contractor must also state the proportions he intends using. The engineer or architect reserving the right to correct these proportions, the contractor being allowed the privilege of revising bid in accordance with the corrected proportions.

One of the reasons why no definite formula has yet been developed, from which can be figured the ultimate strength of concrete within a reasonable margin, is that there has been no well defined and definite method adopted for scientifically proportioning the aggregates so as to give maximum density, which is equivalent to maximum strength. If all concrete construction was figured on basis of maximum density, variations in strength of such construction would not be as great.

It is a reasonable proposition and one within reach, that the ultimate strength for concrete can be figured within a small margin, provided the character of aggregates are known and the proportion of such aggregates definitely stated, which will give maximum density. This is particularly within easy reach in and around New York city, where an excellent grade of trap rock and good coarse sand is readily obtained.

If the specifications require maximum density, it will be found by practical test, if the best cement is used, the resulting concrete will be of about the same strength, even though the proportions of concrete may be 1 part cement, 3½ parts sand and 10 parts stone, and the other concrete 1 part cement, 3 parts sand and 6 parts stone, provided the aggregates have been so graded in size so that each of the above proportions will give maximum density with minimum quantity of cement. In other words, in the first instance, the sand required the proportion of 1:3½ to give maximum density of mortar, and the stone contained 35 per cent of voids. In the other instance, the sand required 1:3 parts to give maximum density of mortar, the stone contained 50 per cent of voids.

The thought of maximum density should be kept constantly in mind and the idea of a fixed arbitrary proportion eliminated, for the character of the available aggregates will entirely govern the proportions which will give the strongest concrete. With these thoughts firmly in mind, we are certainly approaching a basis for a definite formula by which engineers can figure the ultimate strength of concrete. Thus concrete becomes more economical and its safety better assured.

The next important subject is the mixing of these aggregates. Good mixing is absolutely essential. This is a subject, however, which cannot be conveniently covered in a paper of this sort, as the location of the work, and the character of the construction, will govern entirely the method of mixing. This subject, furthermore, is one which is very generally understood and requires very little more said.

Comparative Cost of Constructing Two Identical Reinforced Concrete Buildings—One of Separately Molded Members and One of Members Molded in Place.

BY MASON D. PRATT.*

In 1904 the Central Pennsylvania Traction Co. of Harrisubrg, Pa., built a car barn and a repair shop of reinforced concrete, probably the first buildings in this country built entirely of this material for this purpose. The buildings are one story in height and were constructed in the usual manner by erecting wooden forms and casting all concrete work in place. The same company has just completed a second barn adjacent to the one above described of the same dimensions as the first barn—viz.: 75 ft. wide by 360 ft. long. The last barn is also of reinforced concrete, but owing to conditions which seemed favorable for the purpose, an entirely different mode of construction was followed. All of the members for that portion of the building above the foundation and floors, including columns, beams, wall and roof slabs, were separately molded on the ground and afterwards erected by means of a traveling stiff-leg derrick. This method of construction proved economical and owing to the close similarity of the two buildings in size and general design it is possible to make an accurate comparison of the costs. In describing the two buildings, Barn *A* refers to the original building and Barn *B* the last one erected.

Barn *A* was built on ground which was from 2 to 10 ft. below the floor level. The column footings were placed on solid ground 6 to 12 ins. below the sod and carried up within 1 ft. of floor level, the ground being filled in after the building was under roof. In general plan the building had three rows of non-reinforced hexagonal columns spaced 15 ft. centers longitudinally and 37 ft. centers transversely. The roof consisted of transverse beams, resting on the columns, longitudinal purlins and a 3-in. slab cast in place, the columns being connected longitudinally with beams 6 ins. thick and 2 ft. deep. After the forms were removed from this skeleton the three longitudinal walls were filled in place. Provision was made for future extension laterally by casting brackets in the columns to support roof girders for an adjacent bay. The barn also had a wing 16 ft. wide and 90 ft. long, containing barn foreman's office, lockers and lavatory for the use of motormen, conductors and barn men.

Concrete for this building was mixed in a rotary batch mixer, into which the aggregate was dumped directly from wheelbarrows, and the concrete distributed from the mixer to the job in wheelbarrows by means of runs and an elevator operated by a power hoist.

Barn *B* was built entirely independent from Barn *A*, the first wall being placed 37 ft. beyond the wall of Barn *A*, thus permitting the increase of the plant by one additional bay in the future by simply adding a roof between the two buildings. Column spacing was made the same as Barn *A*, but the columns were square. In order to get roof slabs of a size which could be conveniently handled, the roof beams were spaced 10 ft. centers and alternated in the two bays. Thus on the outer walls a roof beam came at every other column, while on the center wall each column carried a beam and a longitudinal beam between columns supported the ends of two roof beams. The roof proper consisted of slabs, 3½ ins. thick, 10 ft. long and 6 ft. and 7 ft. wide, which were laid directly on the roof beams. Two slabs at the center of every alternate 10 ft. bay were omitted to allow placing skylights. The walls were 6 ins. thick, as in the case of Barn *A*, but were made up of slabs of various sizes. These slabs were all tongued and grooved, as were also the columns. Three-eighths of an inch was allowed for all joints, the horizontal joints being mortared as the work was laid up and the vertical joints filled and pointed after everything was in place. A small percentage of reinforcement was placed in all slabs as an insurance against breakage in handling.

The concrete for this building was mixed in the same mixer used on Barn *A*, located at a central point, the materials being moved in wheelbarrows as before.

Barn *A* had about 290 ft. of open pits under each track, 60 ft. of the front end of each bay being paved with granolithic floor and used as space for washing cars. Barn *B* had the same arrangement in one bay, the other bay, which was intended for storage purposes only, had granolithic floor from end to end. The ground on which Barn *B* was built had been filled in with various materials, mostly cinder from a nearby steel plant, and excavations had to be made for all foundations. In the figures given below, all labor for excavation in both buildings is omitted. In Barn *B* each column had a separate footing as in Barn *A*, which, however, was carried to a point 15 ins. above floor level, and provided with a pocket to receive the column. A layer of sand was put in each pocket to give the column good bearing and to adjust height. A beam 12 ins. wide and 2 ft. deep connected these footings, being cast at the same time with the footings.

The tracks were laid in the storage bay and the granolithic floor cast in place at the time of starting excavations for the foundations, and as soon as the floor was in place the casting of beams, columns and slabs began. The beams and columns were nested by casting the alternate pieces a suitable distance apart, and after removing the forms these became the forms for the intermediate pieces. The slabs were cast in piles, the ends being offset to enable rapid handling. The pieces were separated by means of 40-lb. waxed manila paper. No difficulty whatever was experienced during the erection in separating. In some instances soap was used, but the results were not as satisfactory and the cost was higher than with the paper. The surface of the pieces formed by paper separation showed a close, smooth, dull surface, except for the wrinkles formed by the paper, which was not heavy enough to prevent wrinkling. The paper was also responsible for other defects in the surface finish, owing to the mortar running in between joints where the paper overlapped and forming thin slivers. The paper was easily removed with water from a 1-in. hose, with nozzle ¼ in. The top surfaces of all pieces, of course, were troweled. This gave a rather variegated wall surface to the structure, but a coat of cement wash using a thin mixture of about equal parts of cement and limestone dust applied with whitewash brushes produced a fairly uniform appearance. This method of construction involved the use of slightly more reinforcing steel and a larger yardage of concrete, but the saving in forms, lumber and carpenter work was more than

*16 South Market Square, Harrisburg, Pa.

sufficient to pay for this difference and the additional cost of derrick and erection labor.

The number of loose pieces required was 1,400. These were completely erected in 33 working days, with a loss of only three slabs from breakage.

The derrick used was a standard stiff-leg with 60-ft. boom and 38-ft. mast, mounted on a truck so that it could be moved around the work. Power was furnished by a regular street railway motor through a gear bolted to the flywheel on the driving shaft of a two-drum hoist, the motor being equipped with standard street railway controller and suitable resistance coils. A traction company motorman operated the hoist and a rigger crew placed the material. The heaviest pieces handled were the roof beams, which weighed 7½ to 8 tons. A number of special devices were used to handle the various pieces. For the heavy beams a loop was formed at the quarter points by bending a reinforcing rod, bringing it flush with the top of the beam and scooping out a portion of the concrete while green, and a special hook used to engage this loop. These hooks entered the slotted ends of a steel spreader. The rig was thus adjustable for variable spacing of the loops and for balancing. The slabs were handled by means of slings, holes being formed in the slabs with a short section of ¾-in. gas pipe for receiving bolts. In setting up the side walls, these holes were used to fasten 3x4-in. sticks on each side of the three wall slabs of each bay, thus keeping them in line, and by means of props, in a vertical position until erection had proceeded far enough to remove them. Fig. 3 shows these sticks in position.

TABLE I.—SHOWING COST OF CONCRETE IN SEPARATELY MOLDED CONCRETE CAR BARN.

Barn B.

	Total.	Per cu. yd.
Foundations and Floors, 710 cu. yds.:		
Materials:		
Stone at $1.25 cu. yd.	$ 856.00	$1.20
Sand at $1.30 cu. yd.	132.00	.61
Cement at $1.15 bbl.	1,082.50	1.53
Steel	120.00	.17
Lumber	633.00	.89
Tools	100.00	.14
	$3,223.50	$4.54
Labor:		
Placing reinforcement	$ 19.00	$0.03
Forms	771.00	1.09
Concreting	1,015.00	1.43
	$1,805.00	$2.55
Total materials and labor	$5,028.50	$7.09
Building above Foundations, 948 cu. yds.:		
Material:		
Stone at $1.28 cu. yd.	$1,085.60	$1.16
Sand at $1.30 cu. yd.	546.00	.58
Cement at $1.15 bbl.	1,735.00	1.86
Steel	1,755.00	1.87
Tools	140.00	.24
Lumber	220.00	.15
	$5,481.00	$5.86
Labor:		
Forms	$ 818.00	$0.87
Bending and placing reinforcement	360.00	.39
Concreting	1,152.00	1.23
Erection	1,776.00	1.89
Pointing and cement wash	617.00	.66
	$4,723.00	$5.04
Total labor and materials	$10,204.00	$10.90
Totals, 1,648 cu. yds.	$15,232.50	$9.245
Area covered by building, 360 × 75 ft. = 27,000 sq. ft.		
Cost of foundations and floors	18.5 cts. per sq. ft.	
Cost of building	38.0 cts. per sq. ft.	
Total	56.5 cts. per sq. ft.	

TABLE II.—COMPARISON OF COST BETWEEN CAR BARNS, SEPARATELY MOLDED AND CAST IN PLACE.

(Average including Foundations and Superstructure.)

	Barn A. (Cast in place.)	Barn B. (Separately molded pieces.)
	Per cu. yd.	
Materials:		
Stone, sand and cement	$3.480	$3.480
Steel reinforcement	.915	1.140
Lumber	1.335	.480
Paper		.040
Tools, wheelbarrows, etc.	.145	.145
	$5.875	$5.285
Labor:		
Carpenters	$3.240	$0.965
Bending and placing steel	.095	.230
Concreting	2.210	1.685
Erection		1.080
	$5.555	$3.960
Total cost per cu. yd.	$11.430	$9.245
	9.245	
Dif. in favor Barn B.	$2.185	

Table I gives complete detailed cost of all the concrete work in Barn *B*.

Table II is a comparison of the average costs of all the concrete work on Barns *A* and *B*, the figures covering all charges except general supervision. The concrete aggregate is put at same figure in each to eliminate any difference in unit cost of these materials. The mix was practically the same in each, the largest percentage being 1:2:4. Unit costs for labor were the same in both cases—viz.: ordinary labor, $1.25 per day, and carpenters, $2.50 per day.

It will be noted more steel was required in *B*, but very much less form material and labor. The roof of Barn *B* required more concrete, as all beams and slabs had to be treated as simple members, whereas in Barn *A* full advantage was taken of the T sections. Making full allowance for these differences the actual cost of the concrete structure of Barn *A* over Barn *B* was 15 per cent. Both buildings were constructed by day labor from plans made by the writer and under his direct supervision.

The Sixth Annual Convention of the National Association of Cement Users.

The National Association of Cement Users organized in the winter of 1904-5 has become one of the most important special associations in the United States. The annual reports are valuable contributions to the literature of the cement industry and the committee reports, prepared as they are by authorities, form the basis of many building ordinances and specifications.

The sixth annual convention will be held in Chicago at the time of the Cement Show. Invitations have been extended to foreign concrete associations and delegates will be sent, thus giving the convention international significance. It is believed this will be the largest gathering in the world in the history of the cement industry. The Auditorium Hotel will be headquarters where the officers may be found and meetings will be held.

The following program (subject to minor changes) has been announced.

MONDAY, FEBRUARY 21, 1910.

10 o'clock a. m.:

1. Meeting of the Executive Board at the Auditorium Hotel.

2 o'clock p. m.:

2. Meeting of Sectional Committee on
a. Art and Architecture.
b. Building Laws and Insurance.
c. Concrete and Reinforced Concrete.
d. Exterior Treatment of Concrete Surfaces.
e. Machinery and Appliances.
f. Roadways, Sidewalks and Floors.
g. Specifications for Cement Products.
h. Specifications for Fireproofing.

3 o'clock p. m.:

3. Meeting of the Section on Roadways, Sidewalks and Floors. General discussion covering the preparation of materials, laying, finishing and costs.

8 o'clock p. m.:

4. Formal opening of the convention, Auditorium Hotel.
5. Address of Welcome by the Honorable Fred A. Busse, Mayor of Chicago.
6. Response by the President, Mr. Richard L. Humphrey.
7. Address by Christian C. Kohlsaat, President Lewis Institute, Chicago.
8. Address, John M. Ewen, Consulting Engineer, Chicago, Ill.
9. Business session.
10. Report of the committee on Roadways, Sidewalks and Floors. Mr. C. W. Boynton, chairman.
a. Proposed Standard Specifications for Concrete Street Pavements.
b. Proposed Standard Specifications for Portland Cement Curb and Gutter.
c. Proposed Revision of the Standard Specifications for Portland Cement Sidewalks.

TUESDAY, FEBRUARY 22, 1910.

9 o'clock a. m.:

11. Meeting of the Section on Specifications for Cement Products. Discussion on the Manufacture, Curing, Cost, etc., of Cement Hollowing Building Blocks, Architectural concrete Blocks, Drain Tile and Pipe.

10:30 o'clock a. m.:

12. Report of Committee on Specifications for Cement Products, Mr. W. P. Anderson, chairman.
a. Proposed Standard Specifications for Architectural Concrete Blocks.
b. Proposed Standard Specifications for Plain Concrete Drain Tile.
13. Report of Committe on Machinery and Appliances. Mr. L. V. Thayer, chairman.
14. Business Session.
a. Report of the Executive Board.
b. Report of the Committee on Contributing Members.
c. Place of next Convention.
d. Election of Officers.

8 o'clock p. m.:

15. Annual address by the President, Mr. Richard L. Humphrey, Consulting Engineer, Philadelphia, Pa.
16. Report of the Committee on Art and Architecture, Mr. F. A. Norris, chairman.
17. Report of the Committee on the Exterior Treatment of Concrete Surfaces, Mr. L. C. Wason, chairman.
18. The Use of Concrete for Farm Buildings from the Sanitary Standpoint, S. Cunningham, Jr., New York, N. Y.

WEDNESDAY, FEBRUARY 23, 1910.

9 o'clock a. m.:

19. Meeting of Section on Concrete and Reinforced Concrete, Mr. A. B. Lindau, chairman. General discussion on methods, selection of materials, costs, etc.
20. Laying Concrete under Water—Detroit River Tunnel. Olaf Hoff, Consulting Engineer, New York, N. Y.
21. Comparative Value and Cost of the Groined Arch in large Reservoirs. T. H. Wiggin, Senior Designing Engineer, Board of Water Supply, New York, N. Y.
22. Report of Committee on Concrete and Reinforced Concrete, Mr. A. B. Lindau, chairman.

8 o'clock p. m.:

23. Concrete for Maritime Structures. Chandler Davis, Department of Docks and Ferries, New York, N. Y.
24. Application of Concrete in Barge Canal Work. R. S. Greenman, Resident Engineer, office of State Engineer and Surveyor, Albany, N. Y.
25. Comparative Cost and Efficiency of the Pneumatic Reinforced Concrete Dam.
26. Additional Notes on Use and Cost of Concrete for Small Houses. R. C. Knapp, Philadelphia, Pa.

THURSDAY, FEBRUARY 24, 1910.

9 o'clock a. m.:

27. Meeting of the Section on Building Laws and Insurance.
28. Meeting of Section on Specifications for Fireproofing. Topical discussion on fire-resistive construction of buildings, building regulations and their effect on insurance rates.

10:30 o'clock a. m.:

29. Report of the Committee on Building Laws and Insurance, Mr. W. H. Ham, chairman.
a. Proposed Standard Building Regulations for the Use of Reinforced Concrete.
b. Report on Insurance.
30. Report of the Committee on Specifications for Fireproofing, Mr. R. P. Miller, chairman.
31. Advantages and Costs of Reinforced Concrete Construction. J. P. H. Perry, Contracting Engineer, Turner Construction Company, New York, N. Y.

8 o'clock p. m.:

32. Reserved for Social Entertainment, etc. This evening is reserved for a reception by the officers and members of the association.

(Continued on page 70.)

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Earth and Rock Fill Dam with Concrete Core Wall, Patillas Irrigation Project, Porto Rico.

An earth and rock fill dam with concrete core wall, which with its appurtenant structures will cost about $500,000, is a part of the Patillas irrigation project now under way in Porto Rico. The main structural features of this dam are shown by the accompanying drawings and further explained in the text which follows.

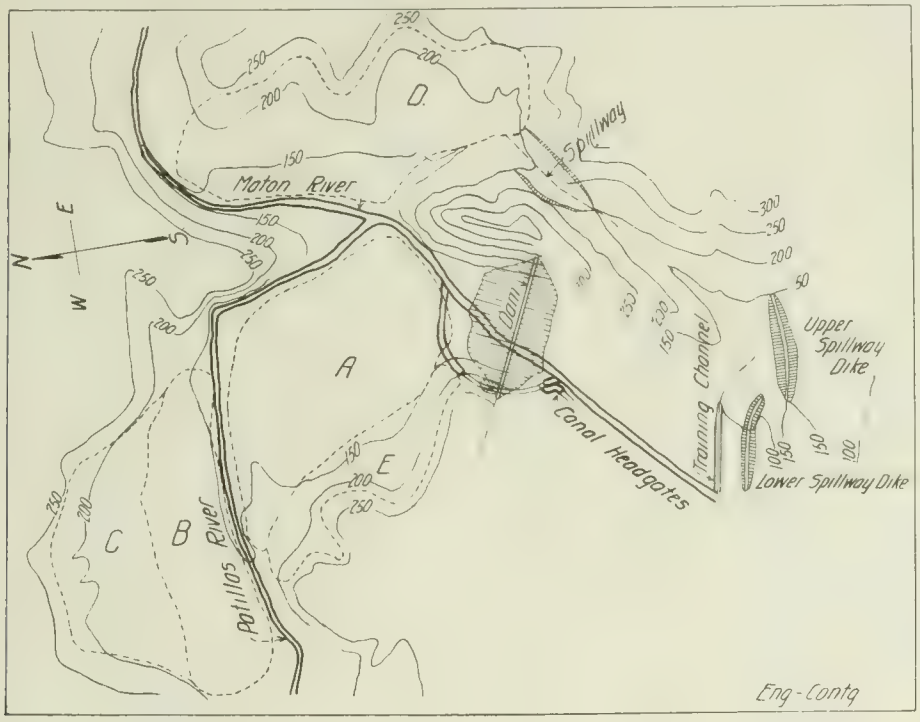

Fig. 1—Plan of Earth and Rock Filled Dam, Patillas Irrigation Project, Porto Rico.

The plan of the dam work is shown by Fig. 1. The embankment crosses the gorge of the Patillas River in approximately an east and west direction. Circling around the west flank of the embankment is the outlet canal, which is partly open channel and partly tunnel through the rock side of the gorge. Flanking the east end of the embankment is the spillway channel, through which the flood water passes by the dam to well below the toe, where it is diverted by dikes and a training channel into the below dam channel of the original stream. The work comprises some 950,000 cu. yds. of excavation and fill in spillway, tunnel and dam and some 3,800 cu. yds. of concrete in core wall, tunnel lining, etc. The dam structure proper chiefly merits description.

As shown by the sections, Figs. 2 and 3, and by the profile, Fig. 4, the dam construction consists of a cut-off trench in which is a concrete core wall, and of an embankment embracing the core wall and composed of a center trapezoid of fine, impervious soil flanked on both stopes with trapezoids of coarser material and finally faced on both stopes with trapezoids of rock fill. The depth of fill is a maximum of 122 ft. and the bottom of the cutoff trench goes down some 20 to 25 ft. further, as shown by the profile, Fig. 4. The length of the dam along the crest is slightly over 1,000 ft. The work comprises, then, two divisions, first the construction of the cutoff trench and core wall, and, second, the embankment fill proper.

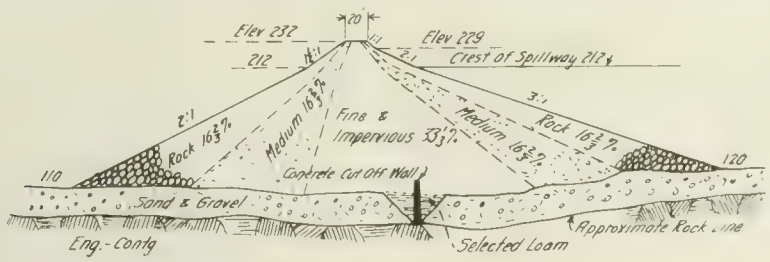

Fig. 2—Section of Patillas Dam Near Center.

The cut off trench is carried down to rock and into the rock deep enough to give the wall a good anchor, as shown by Fig. 5. The core wall, also shown by Fig. 5, is 12 ins. thick at the top, with both sides battered outward at the rate of ½ in. per 1 ft. depth. It extends the full length of the dam across the base and up the stopes to the crest, as indicated by Fig. 4. Its top varies in elevation, but at all points it extends 4 ft. into the dam embankment. Particular attention is given to

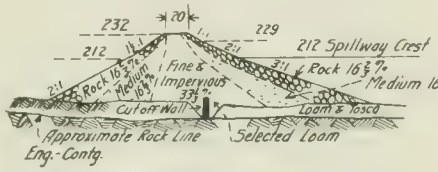

Fig. 3—Section of Patillas Dam Near End.

the anchorage of the core wall into the foundation rock and to the close bond of the concrete and the rock at the base. The exact proportions of the concrete in the core wall are to be determined by test as the work proceeds—the basis of selection of proportions being concrete of maximum density—but the proportions are to be at least 1 part of cement to 2½ parts of sand and 4½ parts of graded stone or gravel, ranging from ¼ in. to 2½ ins. in size. As stated above, density or imperviousness is to be the criterion of satisfactoriness of the core wall. It is therefore to be given rigid inspection and test. The inspection is to be particularly for porosity. The test will be to flood the wall on each side flush to its top with water; the side of the wall opposite that flooded is not to show any definite leakage at the end of 12 hrs. After the test the upstream face of the wall is to be given by plastering a ¼-in. coat of 1:1 mortar.

The backfilling of the cut-off trench on each side of the core wall and to flush with the ground surface is to be done with equal care to secure imperviousness. A natural material, which is found in the excavation areas marked *C*, *D* and *E*, Fig. 1, is to be used; the material selected is to consist of a mixture of clay, sand and gravel or small rock particles, of which the clay content is not less than 45 per cent. The specifications for placing and compacting this material are as follows:

The material shall be deposited as nearly as practicable in horizontal layers which will not exceed 6 inches in thickness after being compacted with rollers, and all stones larger than 4 ins. in diameter shall be removed. Each layer shall be thoroughly and uniformly wetted by sprinkling carts or hose and nozzle, the amount of water used being just sufficient to secure the greatest practicable compacting from the rolling. The rollers shall weigh not less than 1 ton per lin. ft. of tread, and shall be made of alternate large and small discs, whose difference in diameter shall be 2 ins. and whose thickness shall be not more than 12 ins. No brush, roots, or other perishable material shall enter the back-fill. The material shall be brought up uniformly on both sides of cut-off wall so as to avoid excess pressure against either side. Great care shall be exercised in rolling near the cut-off wall and immediately adjacent to the wall the compacting shall be done by hand tamping, the tamping tool weighing not less than 20 lbs. on a face of 12 sq. ins.

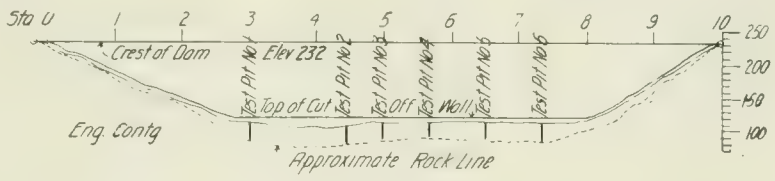

Fig. 4—Profile of Patillas Dam.

Turning now to the dam embankment proper, it will be noted from the sections, Figs. 2 and 3, that it will consist of two grades of earth fill and of loose rock fill. All these

materials will be obtained from barrow pits in several fields within the reservoir and adjacent to the dam, or possibly in part from the spillway excavation. On Fig. 1 the various areas available for the selection of filling material are marked *A, B, C, D* and *E*. The location, area, approximate volume and character as to clay and sand content of these fields are as follows:

Field.	Area in acres.	Depth of good mat.	Av. haul, feet.	Approx. cu. yds.	P. c. by wt. of clay and silt.	P. c. by wt. of sand and gravel.
A.....	44.2	11.2	1,500	800,000	16	84
B.....	26.6	6.0	3,000	260,000	35	65
C.....	24.5	6.0	3,500	235,000	50	50
D.....	45.6	5.0	2,200	370,000	53	47
E.....	15.5	6.6	1,600	165,000	47	53

While it is realized that the exact percentages of the different grades of materials indicated in Figs. 2 and 3 cannot be exactly obtained, it is believed that by careful proportioning they can be closely approximated. The bulk of the material for the dam will come from Field *A*, which contains a large percentage of boulders, which when separated from the finer material are to form the outer rock portions of the dam. By a proper proportioning of Field *A* material, after all stones more than 4 ins. in diameter have been separated from it, with material from one of the other fields, the material from the impervious portion of the dam is secured. This impervious material is to contain not less than 25 per cent and not over 35 per cent of clay, the remainder being sand and gravel. For the portion of the dam marked "medium," material from Field *A*, after all stones over 4 ins. in diameter are removed, is to be used.

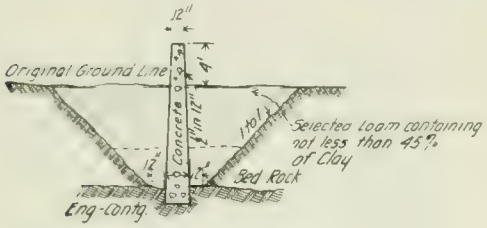

Fig. 5—Section of Core Wall for Patillas Dam.

To prepare for the fill, the area covered by the dam will be plowed to a depth of 12 ins. The method of forming the embankment is specified as follows:

> The dam shall conform to the slopes and dimensions shown on the drawings and if not constructed by the hydraulic method, it shall be built up in successive layers of 6 ins. thickness, thoroughly rolled and compacted as provided for backfill of cut-off trench, excepting the rock portions of dam, which, however, shall be carried up simultaneously with and maintained slightly above the central portion of dam. All rock larger than 4 ins. in diameter shall be removed from the central portions into the rock portion of dam. To effect the proper mixture of materials for the central third of dam the loads from different fields shall be deposited in such sequence and at such places as the engineer may direct and the method of spreading will be subject to the approval of the engineer. In so far as it may be practically effected in the regular handling of the material, small and large rock will be mixed, to the end that large cavities may be avoided in the rock masses on either slope, but a sufficient quantity of finer material must be incorporated with the boulders in the up-stream slope to practically fill the voids.
>
> The contractor may, at his option, build the embankment by the hydraulic process, either by delivering the material dry to the dam, depositing same in successive narrow dikes on either slope and effecting the final segregation of the materials in these dikes by sluicing with water, or he may adopt some system of pumping the material to place. Whatever the process adopted, however, it will be subject to the approval of the engineer, the proportioning of materials hereinbefore provided shall practically be maintained and it will be further subject to the following requirements: Until cut-off wall has been topped, material shall be delivered simultaneously to both sides to avoid unbalanced pressure against the wall; longitudinally the dam shall be built up as uniformly as possible; the waste water from settling pond shall be promptly and safely discharged by means of flumes carried through breaches in rim of down stream embankment or by any other means that may be necessary to facilitate settlement of the sluiced material; the size and depth of settling pond, the slopes leading toward center of dam and the points at which the sluiced material is first delivered shall be so regulated as to secure disposition of the finer materials near the center of dam and produce the desired gradation of materials from the centre outward, but a pure silt or clay, even at centre of dam, is neither desired nor will it be permitted; any tendency toward stratification shall be continuously and effectively prevented by poling or other approved means; the manner of disposing the materials will at all times be subject to the approval and regulation of the engineer.

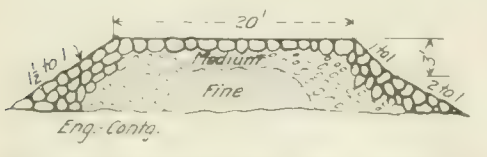

Fig. 6—Section Showing Top Paving of Patillas Dam.

Figure 6 shows the manner of finishing the crest of the dam. The dry rock paving is to be done with stones having a top face of at least 1 sq. ft. and a depth of 1 ft. These stones are to be laid close and are to be wedged and tightened by driving spalls into the interstices.

The Patillas dam as described is to be constructed under the direction of the Porto Rico Irrigation Service, Mr. B. M. Hill, chief engineer.

Cost of Stripping a Gravel Pit.

BY GEORGE RATHJENS.*

During the month of September, 1909, the following record was made in stripping a gravel pit in the Dakotas. The pit in question was evidently of glacial origin and was covered with a sandy loam, there being a number of pockets of varying depths, the maximum about 10 ins. The length on the railroad right of way was 3,000 ft., the width 50 ft. and the length at the back 2,000 ft., one end being square with the railroad. The contract called for stripping a width of 250 ft., the material being carried from the track towards the back of the pit and deposited in winrows with a base of 45 ft. A part of the material was used for grading the straight storage tracks paralleling the main line, the pit being on a curve.

The outfit consisted of 1 Austin grader, 6 1¼ cu. yd. dump wagons, 4 No. 2 wheelers and 2 plows. Two more wagons could have been used to advantage, as the grader sometimes had to wait for wagons.

The Austin grader usually worked a strip or line about 350 ft. long by 35 ft. wide, with an average haul of about 150 ft., the longest haul being 220 ft. Wheelers were used where pockets were found. The contractor owned his teams, but teams with drivers were worth $5 per day when hired. Hay and other feed was purchased from nearby farmers. During the month mentioned the contractor stripped 19,970 cu. yds. at the costs here given:

Austin Grader:	
[illegible] teams on push*, 21 days at $5.....	$ 300
[illegible] teams on machine, 21 days at $5.....	960
[illegible] Wagons:	
[illegible] teams, 24 days at $5.....	660
Wheelers:	
3 teams on wheelers, 11 days at $5.....	165
1 team on plow, 11 days at $5.....	55
1 team on scraper, 11 days at $5.....	55
Labor:	
1 foreman, straight time.....	85
1 mucker, 24 days at $2.....	48
1 corral man, 28 days at $2.....	56
2 Austin grader drivers, 24 days at $2.25.	108
Total	$2,492

*Teams on push operated the elevator, team power being the only power used.

The cost is almost 12½ cts. per cubic yard.

The total time was 28 days, as shown by corral man's pay, but 2 working days were lost on account of rain and 2 on account of dust. The writer does not know what other expenses the contractor had nor the cost of feeding teams nor cost of repairs, etc.

*Box 55, Urbana, Ill.

A Special Hand Auger for Test Boring and Method of Using it in Prospecting for Coal.

The hand auger shown by the accompanying illustrations was developed by Mr. Baird Halberstadt, engineer and geologist, Pottsville, Pa., in the course of his work in prospecting some new coal fields in West Virginia. The conditions under which the device was worked out and the methods of using it are described farther on. From this description it will be seen that the auger is apparently well suited for use by engineers and contractors for making test borings of any kind. The following description is condensed from a paper by Mr. Halberstadt before the Appalachian Engineering Association:

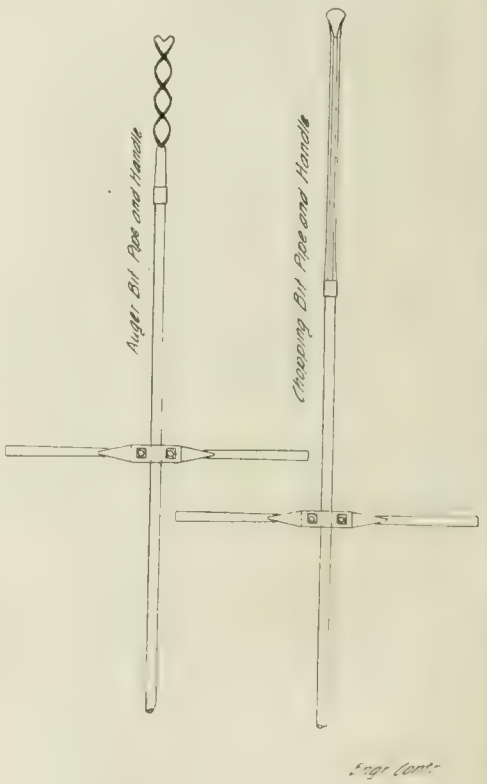

Fig. 1.—Auger for Making Test Borings.

Some few years ago the writer was engaged to examine and report on a tract of land comprising some 75,000 acres in West Virginia. The primary object of the examination was to determine whether this tract in whole or in part was underlaid by a coal bed or beds of workable size and of commercial value, and later, if the prospects were found to be of a promising nature, to have the property carefully and thoroughly developed.

The total area developed exceeded 50 square miles and the area underlaid by this bed approximates 10,000 acres. As the work was not pursued continuously, the exact time required to perform it can not at this time be accurately given. Work was suspended at different times, while at others the drill crews were transferred to distant parts of the tract

for special work. Suffice it to say, with these exceptions, through summer's heat and winter's cold, the work was pushed on almost uninterruptedly.

The work was at times carried on when a zero temperature was registered. A small fire was kindled and if snow lay on the ground it was melted in a bucket to supply not only water but hot water, which enabled us to drill through frozen ground without difficulty and at the same time the necessity of making long trips down to the streams was done away with. Neither drilling nor drift driving were interfered with by even excessively cold weather. Sleet and rain did, however, interfere and at such times the men were set to driving drifts. I generally had a few trial drifts driven in a few feet under cover, so that when surface work was not possible the men could be employed in them instead of losing time in the camps because of rain and sleet. These facts are given to show that a thorough test was made of the drilling auger and accessories which are about to be described:

For a number of years prior to the beginning of the work referred to, the usual methods of prospecting by trenching and drilling with a hand churn drill, were by no means satisfactory to the writer. To all the large drill manufacturers letters were written asking for information regarding a tool which would meet the requirements. These fully explained what was desired. To each letter an answer was received stating that no such tool was made, neither had they ever heard of one. In metal prospecting in the far west a drill auger resembling the one to be described had been sometimes used. Of this I obtained a description and, after modifying and improving upon both the form of auger and handle, drawings were sent to several shops and from them the tools were made. As the work progressed, such changes were made as were found to be improvements upon the originals. In its present form it has given the greatest satisfaction and no trouble from breakage or in fact of any kind has been experienced.

The tool, Fig. 1, consists essentially of four parts—a heavy auger, a handle, a cutting bit and a number of sections of 1 in. gas pipe (one 8 ft., the others 3 ft. in length), threaded at both ends and fitted with ferrules. The auger made of ¼-in. steel, 4 turns in 13 ins., rounded and threaded to fit the ferrule, and to this are screwed the sections of pipe as the depth of the hole increases. It has been found well to have the first section made longer than the others, as the handle can be passed up and down as required without entirely uncoupling it, as becomes necessary when passing over a ferrule. The handle is made in two sections as shown in the drawing, the joining ends are held firmly by two bolts and a circular hole drilled of a diameter slightly less than that of the pipe. With the bolts tightened up fully, the pipe will twist before the handle will slip around the pipe.

For holes exceeding 10 ft., when loose rock is encountered, a cutting bit replaces the auger until the obstruction is passed through. It has been found that greater speed can be made by using for holes wherein obstructions are met at a depth of less than 10 and more than 4 ft., ordinary jumpers are made of 1⅛-in. octagon steel of good quality. The bits are of the round rather than triangular shape. Two of these are usually carried with the party, one 6 ft. and the other 10 ft. long. The accompanying detail working drawing, Fig. 2, fully explains the forms of each of the parts and, the dimensions being given, from them the whole outfit can be made should any desire to have one. Any good colliery blacksmith should be able to make one at a cost not to exceed $15.

The outfit consists of 2 auger bits (one for any emergency, although but two or three were broken in drilling the 65 miles outcrop), a cutting bit, 2 jumpers 6 and 10 ft., one-half dozen 18-in. bastard files for sharpening the blades of the auger, an 8-lb. striking hammer, an 18-in. Stilson pipe wrench, a monkey wrench for loosening the bolts in handle, a galvanized iron bucket and tin cup, a mattock and short handle shovel, an oil cadger filled with lubricating oil for use on ferrules and pipes, and a short handle cutting axe.

The entire outfit can be carried readily by a party of three men almost anywhere, in fact where the holes are not far apart two men by making an extra trip can transport them. It has been found advantageous to use three rather than two men to a crew, as three can work to far better advantage, and the difference in cost is more than made up by the increased amount of work accomplished.

If the hole be on the slope of a hill, a space of say 2½ to 3 ft. square should be leveled off with a mattock and spade. This gives the men firm foothold. The auger attached to an 8-ft. section of pipe to which the handle is securely attached is put down and the handle turned until the auger has cut through 7 or 8 ins. of "wash"; it is then removed and a cup or two of water is poured into the hole and drilling is resumed. The purpose of the water, if the ground be very dry, is to dampen the soil, but do not make it too wet. The material cut through will then cling to the auger, filling the grooves, and the whole can be quickly removed when the auger is withdrawn. On each drawing up of the auger a small quantity of water is introduced.

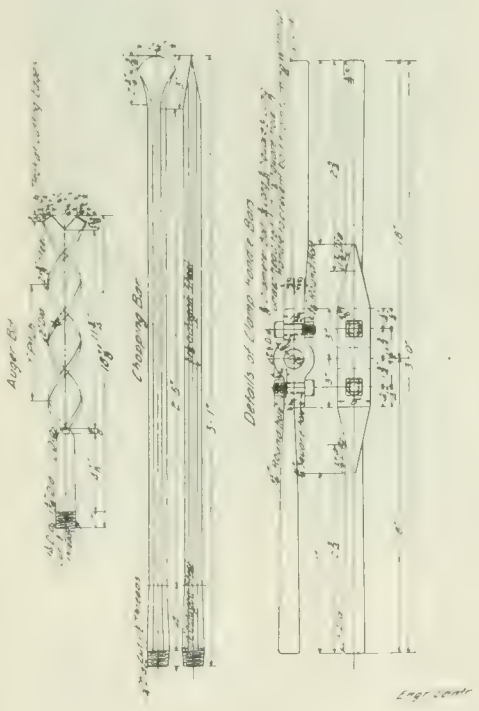

Fig. 2—Details of Bits for Test Boring Auger.

The advantage of the auger over the churn drill is here exhibited, for with the former neither a scraper, swab stick or sand pump is required, while with the latter the whole mass must be made pasty, so that it can be drawn up with swab stick or in a sand pump. Another advantage the auger has is that the sides of the hole become packed hard and no difficulty is experienced from caving in. The holes drilled with it, if covered, remain open for many months. The sand pump was used only in extremely wet holes and generally it was only necessary to use it when holes were drilled near water level. Throughout this entire work the sand pump was resorted to in but a few instances.

Now suppose a boulder or rock was encountered when a depth of 4 or 5 ft. had been reached, the auger was removed and the 6-ft. jumper was put in and a hole driven through the rock with the aid of the striking hammer. How was it possible to know that it was only a boulder and not a solid ledge of rock that had been struck? The sense of touch determines this, for if a boulder there is seemingly a giving away feeling which is not experienced when a solid ledge is struck. Rocks 18 ins. thick or more have been cut through and after some little experience the men can quickly decide whether the rock encountered is a floater or a solid ledge. The rock being cut through, the auger is again put into service and the drilling continues.

As the blades of the auger may become dull after 20 to 30 ft. of soil have been cut through, these are filled up and made sharp again without removing the auger from the pipe. Should the drill become fast in the hole, a few reversed turns will most likely free it and it can be drawn up with but little effort. If difficulty be encountered, the 10-ft. jumper can be used as a bar, placing it beneath the handle and with one end on a stone a short distance up the hill. In all this work an auger was not lost. A Stilson or other pipe wrench can be used to advantage in uncoupling the sections of pipe, and the method used was to place the drill on the ground with handle held down by one man, while the other uncoupled the sections with the pipe wrench. If oil be used on the threads, but little difficulty will be experienced in detaching the sections.

The best record made in this concrete like "wash," including the drilling through a boulder, was 10 ft. in 70 mins. In ordinary "wash" of course greater progress could be made.

In further comment on this auger Mr. Halberstadt writes us as follows: "The whole thing is so simple in construction and moderate in price that it is surprising to me that no one had heretofore used such a tool in surface prospecting. I used it very successfully in drilling over a distance of 60 miles along the outcrop of a coal bed and it never failed me. It is very far superior to the old churn drill, since by using a small quantity of water the earthy matter becomes pulpy and when the auger is withdrawn it brings with it in the grooves the material cut, thus doing away with swabbing and sand pumping. I have estimated that with the use of this tool we saved at least $10,000 to $15,000 in the development of a mining property in West Virginia."

Method of Making a Blast Displacing 180,000 Tons of Rock with Some Costs.

A blast in which about 19½ tons of powder were exploded, displacing some 180,000 tons of rock, was fired on Aug. 30, 1909, at the Morena Dam of the Southern California Mountain Water Co. The purpose of this blast was to supply rock for the rock fill forming the dam named and the method of making the blast and the costs given are presented from information furnished us by Mr. M. M. O'Shaughnessy, San Diego, Cal., chief engineer of the water company.

The plan and profile Fig. 1 show the ledge or quarry blasted. The rock is solid granite. The general plan of operations was as follows: An open cut 12 ft. wide and 100 ft. long was excavated along the toe of the old quarry wall. About 100 ft. back of this cut and parallel to it a 4x5 ft. tunnel 115 ft. long was carried into the hill. This tunnel was charged with "Champion" powder and dynamite and the blast was fired. The sketches Fig. 1 show the lines broken to, which were considerably wider than was expected.

The level of the floor of the open cut was —10 and the level of the floor of the tunnel was 0, or 10 ft. higher; the two levels conformed, therefore, to the natural dip of the formation, which is about 10°. The idea of the layout was that the blast would raise and shatter the mass between cut and tunnel and throw it toward the cut. At this point it may be noted that Mr. O'Shaughnessy writes that the "blast lifted the whole mass up gently to an elevation of 20 or 30 ft., and threw it to the left as intended." The tunnel drift was run level into the hill, but about 70 ft. back from the portal there was excavated a powder chamber and at the extreme end of the drift a second and larger chamber. As will be seen, both powder chambers were depressed

below the grade of the tunnel and were also set off-line.

The charges employed were as follows: In the main powder chamber 8x8x14 ft there were 571 50-lb. boxes of 7 and 9 per cent "Champion" powder, 38 boxes of No. 2, 40 per cent dynamite and 40 boxes of No. 1, 60

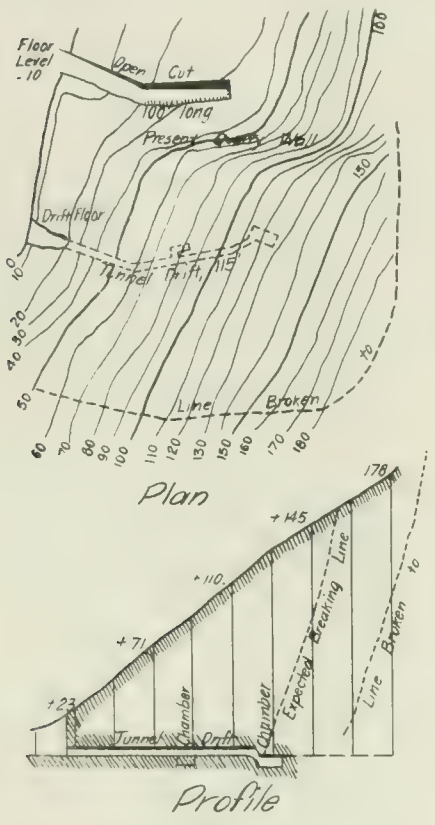

Fig. 1—Plan and Profile of Large Blast.

per cent dynamite. The weight of the explosive was thus:

	Lbs.
571 boxes powder at 50 lbs.	28,550
38 boxes 60% dynamite	2,000
40 boxes 60% dynamite	1,600
Total (16.5 tons)	32,150

In the smaller chamber there were 100 boxes of 7 per cent powder, weighing 5,000 lbs., and 30 boxes of 40 per cent dynamite, weighing 1,500 lbs., or a total of 6,500 lbs., or 3¼ tons.

Commenting on these charges Mr. O'Shaughnessy writes: "In large blasts where powder forms the bulk of the charge it is preferable to sink pits below the floor level of the tunnels. The first reason for this is that loose powder is loaded into pits with greater facility and greater compactness of the charge is obtained by the men in the pit constantly treading the powder while placing it. The second reason is that the sides of the pit offer greater resistance than it is possible to obtain where the powder is loaded directly into the end of the tunnel or drift. The greater resistance offered by the pit is of the utmost importance, as the resistance offered determines the quantity as well as the quality of explosive necessary to obtain results and maximum results will be obtained only where the powder has been confined until the maximum pressure has been attained. The seemingly large pressure of dynamite used in this blast, namely 2,000 lbs. of 60 per cent and 1,900 lbs. of 40 per cent in the end pit and 1,500 lbs. of 40 per cent in the intermediate pit, were used first to obtain instantaneous maximum pressure, this being dependent on the rate of speed of detonation of the dynamite, and second for their percussive action."

The manner of loading the chambers was as follows: In the end chamber about 10,000 lbs. of powder was first placed over the bottom. On this powder was stacked two boxes high the 2,000 lbs. of 40 per cent dynamite, the boxes being arranged in a semi-circle touching the west wall of the chamber. In a similar manner the 1,900 lbs. of 60 per cent dynamite was arranged in contact with the east wall of the chamber. The remaining powder was then placed around and over the dynamite. The purpose of this arrangement of the charge was to have the percussive action of the dynamite open a horizontal break about 2 ft. below the tunnel floor into which the more slowly expanding powder gases would spread, thus obtaining a greater lifting purchase and reducing the chances of a blowout. In the intermediate pit much the same arrangement of explosives was adopted. First 2,500 lbs. of powder were placed over the bottom; on top of this was piled two boxes high against the north pit wall the 1,500 lbs. of 60 per cent dynamite; the remaining powder was piled over and around the dynamite. In this case the dynamite was arranged to open a

Fig. 2—View of Face of Quarry After Blast.

horizontal break in the direction of the end pit or chamber.

The wiring of the charges was arranged as follows: From the battery a No. 16 gage insulated wire run to the 60 per cent dynamite in the end pit and thence to the 40 per cent dynamite in the same pit; the circuit was then continued with a No. 24 gage wire to the dynamite in the intermediate pit and thence by a No. 16 gage wire back to the battery. All wires were covered with dirt to prevent damage and were frequently tested during loading. The resistance of the circuit at the portal was 8 ohms.

The tamping of the charges was as follows: Beginning at the end pit, fine dirt was well tamped into the powder and to fill the tunnel to a distance 10 ft. back from the pit. Then rock bulkheads were built across the tunnel at intervals of 10 ft. and filled between with dirt, the bulkheads permitting the way to be tamped solid. At the entrance to the short drift into the intermediate powder chamber a green oak timber bulkhead was built, after tamping the chamber, and was braced against the facing wall of the tunnel proper. The tunnel tamping was then continued to within 20 ft. of the portal, using the rock bulkheads filled between as before described.

In loading, the men were required to remove all matches and smoking material and to remove their shoes and work with feet wrapped in sacking. The loading was superintended by Mr. J. S. Molony, resident engineer, and by Messrs. A. H. Crane and H. F. Smith, agents, Du Pont Powder Co.

The blast as before stated broke up some 180,000 tons of rock. The view Fig. 2 shows the face of the quarry after blasting. Figure 3 shows the Lidgerwood cableway bucket handling small stone into the dam; large stones were chained.

The cost of this blast as given by Mr. O'Shaughnessy was as follows:

Tunnel and loading	$2,478.15
Open cut	3,499.80
Explosives	3,116.00
Total	$9,093.95
Salvage, 1,400 cu. yds. rock from open cut at $1	$1,400.00
Corrected total	$7,693.95

This gives a cost per ton of rock blasted at 4.274 cts.

Civil Service Examinations.—The United States Civil Service Commission announces an examination on Feb. 16-17, 1910, to secure eligibles from which to make certification to fill a vacancy in the position of computer, $1,600 per annum, in the Coast and Geodetic Survey, for duty at Manila, Philippine Islands, and vacancies requiring similar qualifications as they may occur in the Coast and Geodetic Survey. The Commission also announces an examination on Feb. 16-17, 1910, to secure eligibles from which to make certification to fill vacancies as they may occur in the positions of assistant geologist and junior geologist in the Geological Survey, at salaries ranging from $1,000 to $1,600 per annum. The salaries paid will depend upon the experience and qualifications of the eligibles secured. In certain cases where only a portion of the time of the appointee can be given to the work of the Department, the compensation will be per diem basis for the service

Fig. 3—View Showing Cableway Depositing Broken Rock in Dam.

rendered. Employment in the position of temporary field assistant will also be made from the resulting eligible list as far as possible. The compensation of such positions ranges from $60 to $100 a month, and the length of employment from three to seven months.

The new double-track steel bridge across the Susquehanna River at Havre de Grace, Md., built for the Baltimore & Ohio R. R. Co., was opened for traffic January 6. The new bridge was constructed at a cost of more than $2,000,000, and is more than a mile in length.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Data on Street Work at New Bedford, Mass.

The greater part of the street improvement work of the city of New Bedford, Mass., is done by city forces under the direction of the superintendent of streets, from whose report the following data have been abstracted. During 1908 a total of 25,925 sq. yds. of new macadam pavement was constructed at a cost of 54 cts. per square yard, the average amount of crushed stone used being .383 ton per square yard. This stone was obtained from the city crushers and cost 98½ cts. per ton. The stone cost an average of 66 cts. per ton delivered at the crusher and the average cost of crushing was 32½ cts. per ton. As an average of .383 ton of stone was used per square yard of macadam, the cost of the stone was 37.72 cts. per square yard, leaving 16.28 cts. for the labor cost of spreading, rolling, etc. A total of 82,332 sq. yds. of macadam was rebuilt in 1908 at a total cost of $34,007, or 44.9 cts. per square yard, an average of .315 ton of stone being used per square yard. The cost of the stone at the crusher was 31 cts., making the labor cost of rebuilding the macadam 13.9 cts. per square yard. In previous years the cost of contracting new macadam and rebuilding old macadam has been as follows:

New Macadam:	1903.	1904.	1906.	1907.
Area, sq. yds.	38,572	41,600	20,527	35,478
Stone used, tons.	13,945	14,697	6,289	.....
Tot'l cost per sq. yd.	$0.463	$0.470	$0.475	$0.530
Average amount of stone used per sq. yd., tons.	.497	.352	.357	.323
Macadam Rebuilt:				
Area, sq. yds.	37,403	30,727	28,004	10,229
Stone used, tons.	11,584	8,296	8,288	.....
Tot'l cost per sq. yd	$0.422	$0.383	$0.418	$0.503
Average amount of stone used per sq. yd., tons	.309	.270	.298	.305

During 1908 a total area of 3,934 sq. yds. was paved with bitulithic at a total cost of $2.264 per square yard. In previous years the cost of this kind of pavement had been as follows: 1903, 10,791 sq. yds. laid, at $2.26 per square yard; 1904, 13,338 sq. yds., at $2.22 per square yard; 1907, 12,802 sq. yds., at $2.40. In 1907, 9,851 sq. yds. of bitulithic were given a top coat at a cost of about 10 cts. per square yard.

A total of 8,367 sq. yds. of granite block pavement on concrete foundation was laid in 1908 at an average cost of $3,713 per square yard. The average cost of this type of pavement in previous years, some being laid in 1905 and 1907, was as follows: 1903, 2,823 sq. yds., at $3.11 per square yard; 1904, 3,209 sq. yds., at $3.12 per square yard; 1906, 1,769 sq. yds., at $2.23 per square yard. In 1903 251.78 sq. yds. of granite block pavement on gravel was laid at a cost of $2.50 per square yard. Only 840 sq. yds. of cobble pavement was laid in 1908, the average cost being 51 cts. per square yard. In 1904 810 sq. yds. of this type of pavement was laid at a cost of 40 cts. per square yard. Approximately 22,405 lin. ft. of gutters were constructed in 1908, the total area of the gutters at a cost of 40 cts. per square yard. Approximately 22,405 lin. ft. of gutters were constructed in 1908, the total area of the gutters being 8,531.8 sq. yds. The average cost per square yard was 66 cts. and the average cost per lineal foot of average width was 26.6 cts. A total of 4,020 lin. ft. of gutters, having a total area of 1,527 sq. yds., was repaired, the average cost per square yard being 33.6 cts. and the average cost per lineal foot 12.7 cts.

The costs for gutter work in previous years, none being done in 1905, were as follows:

New Gutters.	1903.	1904.	1906.	1907.
Length in feet.	33,745	38,288	21,921	26,024
Average width, ft.	3.3	3.3	3.5	
Area, sq. yds.	12,372	14,244	8,551	10,879
Cost per sq. yd.	$0.741	$0.661	$0.764	$0.752
Cost per lin. ft.	$0.269	$0.246	$0.298	$0.291
Gutters Repaired:				
Length in feet.	1,894	435	540	162
Area, sq. yds.	814	145	206	54
Cost per sq. yd.	$0.115	$0.27	$0.350	.....
Cost per lin. ft.	$0.187	$0.09	$0.13	.....

The stone curbing laid in 1908 amounted to 14,605 lin. ft., the cost per lineal foot being 83.3 cts. Of this amount 55 cts. was for the stone and 22.7 cts. for the labor. The cost of stone curbing in previous years, none being laid in 1905, was as follows:

	1903.	1904.	1906.	1907.
Length, ft.	18,094	13,714	2,466	11,371
Cost of stone, per ft.	$0.52	$0.52	$0.52	$0.550
Cost of labor, per ft.	$0.18	$0.28	$0.27	$0.321
Total cost per foot.	$0.70	$0.80	$0.79	$0.871

During 1909 the city used 12 cars of dustoline on its macadamized streets. The first car was applied June 6, and the last car Aug. 14. On those streets on which two applications were made, an interval of 67 days elapsed between the first and second applications. Data on the use of the dustoline follow:

Amount used	100,501 gallons
Cost of material	$7,504.70
Cost of distribution	$467.96
Total cost	$7,972.66
Length of roadway treated once	27,207 miles
Length of roadway treated twice	8.939 miles
Length of roadway treated as of one application	45.085 miles
Number of gallons to mile of road, one application	2,229.000
Cost per mile of road, one application	$176.84
Number of square yards, as of one application	597,223.00
Cost per square yard, one application	.0133 or 1⅓c
Cost of application per mile of road for one month (estimated)	$70.00

Concrete Pavement Construction at Boise, Idaho.

The city of Boise, Idaho, is now having constructed a considerable amount of concrete pavement. The city had had some previous experience with this type of pavement, as two years before the street commissioner had built a number of concrete sidewalks, and a year ago an alley had also been paved with concrete. The sidewalks had plain surfaces without marks or creases. The crossings were 6 ins. to 8 ins. thick, 5 ft. wide, of a 1—8 river run mixture, and the top was smoothed off with a shovel. These crossings were built exceptionally high and as a consequence they receive the thumping of everything that crosses them. These crossings show no mark nor sign of wear at the present time. The alley was paved in a manner similar to the crossings, except that the concrete was placed in two layers, the bottom layer being a 1—10 mixture and the top a 1—7 mixture. This pavement also has shown no signs of wear. This year it was decided to lay 8½ blocks of concrete pavement on Front St., and in a paper read at the last annual meeting of the American Society of Municipal Improvements the city engineer, Mr. J. B. Marcellus, describes the work now being done. The street now being paved is parallel to the railway freight yards, where warehouses and the freight depot face the street, as also does the hay market and electric interurban freight depot. As a result the traffic is slow, but heavy.

The width of pavement is 69½ ft., the reason for this being that on the south side no sidewalk or curb is required because teams drive directly up to the warehouses, and, the street car tracks being laid in the center, the north sidewalk and curb are narrowed to 10½ feet.

The work is being done by contract and the usual bond for performance and quality of work was entered into, but no guarantee or maintenance agreement was required. The bidder, however, is to protect the city against any claims for infringement of any patented article, invention, arrangement or appurtenance that may be used in connection with this work. The work at the present time is about half completed. The sub-grade so far has been good. All of it is being rolled thoroughly with a 16-ton roller. The specifications require all spongy places to be refilled with gravel.

The cement used on the work is made at Devil's Side, Utah, and is known as "Red Devil." All tests of the cement are made by the standard method of the American Society for Testing Materials. A good quality of river sand is being used, very clean, although a little fine, and having 30 per cent of voids as determined by a number of tests. The gravel is excellent. It consists of crushed granite boulders up to 6 ins. in diameter, porphyry, rhyolite and various other forms of river wash in a mountainous country. These are screened through a 2½-in. mesh screen and grade up well in size. The gravel is obtained from the bed of the Boise River, and is all passed through a jaw crusher to crush the oversize, but, as in all jaw crushers, "flats" or "pumpkin seeds" over 2½ ins. in longest diameter will come through. These are easily broken with a 7-lb. hammer, and one man, working only a part of the time, keeps most of the pumpkin seeds broken. A number of tests shows the gravel to contain about 40 per cent of voids.

These materials are mixed in the proportion of 1—3—7 and give a concrete that fills well and which, after thorough tamping, can be smoothed off with a wooden float. No topping or special mixture is required for the top, the specifications requiring only a uniform surface with no stones larger than ½ in. in diameter to show. Sometimes a mixture of sand and cement is used to level up with if the concrete does not tamp down level, or an unusual number of large stones appear on the surface. The final thickness of the pavement is 8 ins. Two mixers are being used, one run by a gasoline engine and the other by a motor, at a cost of $22 per month, including moving of connections. Both mixers are small size, but turn out from 30 to 40 cu. yds. per day.

Expansion joints of ½ in. are provided at the curbing and at every 25 ft. at right angles to center line of street. These joints are to be filled with paving pitch. At present they are filled with ½-in. dressed boards. After the concrete is set sufficiently it is covered with 2 ins. of dirt and kept wet for seven days.

The bid accepted by the Board of Public Works was as follows:

	Per cu. yd.
Concrete	$5.29
Excavation	.48
Excavation below subgrade	.55
Refill below subgrade	.85

The gravel and sand cost 80 cts. per cubic yard delivered. The cement costs about $2.75 per barrel f. o. b. Boise. Labor is $2.50 for eight hours, and teams $5, although the contractor has sublet the hauling of the gravel and sand at 60 cts. per cubic yard. At the contract prices the cost of the pavement will be about $1.51 per square yard. The other pavements in Boise have cost $2.50 per square yard and upward, so with this difference in price the city can afford to do considerable maintenance.

Mr. H. M. Wheeler, chief engineer of the Chicago Railways Company, in an article in the Electric Railway Journal gives the following formula for headway on merged car lines:

$$\text{Resulting headway} = \frac{Hh}{H+h}$$

in which

H=headway on one car line.

h=headway on another car line.

Railway Section

Note: This section is devoted to methods and costs of constructing railways. It will cover road-bed and track construction, contractor's plant and organization, surveying methods and permanent way structures.

Reports on Interurban Railway Lines by Engineers and Promoters.

Mr. J. W. Billingsley* lately read a paper before the Louisiana Engineering Society on "Interurban Railway Development in the South," in which some good hints were given for the benefit of engineers who may some time endeavor to promote such enterprises.

Engineers, the author said, often make the mistake of giving undue importance to the item of cost of construction and to the physical features of the line. The object of the preliminary report is to satisfy the promoters and other parties interested that the line will be a paying proposition. Only those matters should be considered that will affect to a considerable degree the question of net earnings. The question of whether a survey will be necessary is one to be settled as a result of this report, the only object of the survey being to more accurately determine the cost.

A survey will enable the amount of earthwork to be determined closely. In many sections this item amounts to only from 8 to 12 per cent of the total cost of construction and a discrepancy of even 25 to 30 per cent will affect the total cost of construction only 3 or 4 per cent. There may be considerable bridge construction, but this item can be estimated within close limits by going over the country. The country in the mind of the writer is the low lying, comparatively flat country of the south and southwest.

In the preliminary report special attention should be given to the gathering of reliable traffic data between the termini. It is interesting to note that a difference in estimates of cost of construction of $100,000 would make a difference in the net earnings of approximately, say $5,000, whereas a difference of only about $8,000 in estimate of gross earnings would change the net earnings by nearly the same amount; hence it is evident the preliminary report should deal more with estimates of revenue than with estimates of cost of construction.

A certain value attaches to the ability to compare the proposed line with others operating under as nearly similar conditions as possible. The check, however, to be of value should be on lines located in the same section of the country and serving similar traffic conditions. It is said that in a rapidly growing, somewhat undeveloped country like the states of Texas and Oklahoma the passenger travel is from 40 to 50 per cent greater per capita than in old and more closely settled communities. Interested parties may often be led to erroneous conclusions by estimating earnings on a basis of so much tributary population per mile of track. Examinations by the author of ten interurban lines at random in the middle west showed the per capita earnings to range from $2.30 to $11, so the danger in using this method alone in estimating gross receipts is evident. The most difficult and important part of a preliminary report is the estimating of gross receipts. Consequently local conditions must be very carefully studied as regards the habits of the people, their principal occupations, and all local characteristics and phenomena. It has been found advisable to have statisticians spend weeks in counting passengers handled by parallel steam lines, wagon and pedestrian traffic, and estimating express business. Local conditions vary so greatly that only a study of the territory will indicate the best methods to adopt in ascertaining existing travel and traffic and estimating how much of this would be handled by the proposed line and how much the building of this line would increase traffic.

The investor wants the information mentioned. There is no question that an interurban line will assist in the development and building up of a territory, but it should be a paying proposition to the investor. Promoters must present the matter to possible investors in an attractive and sane manner. Bond houses are cautious about investing in interurban railway propositions. An examination of statistics about street and interurban properties in the state of Ohio shows that of a total of 89 only 58 show net earnings. Of these, 18 show a deficit for the last 2 years, 6 a deficit for 1 year and a slight earning for the other year, and 8 show a very slight earning, making a total of 32 which are a poor investment to the bond holder. This is particularly so, inasmuch as very few of these poor properties are probably properly maintaining the physical condition of their property. Thus in the state of Ohio 55 per cent of the companies showing operating statements offer a questionable security to the bond holder. This is 36 per cent of the total number in the state. Going back of cold statistical reports it may be found that a number are short lines built to develop real estate and therefore have been extremely profitable in that way.

From the bond holder's point of view, and it is the bond holder for whom all reports are made, a railroad is a losing investment if there is not sufficient traffic between termini. Inefficient management is a passing phase of operation. Poor judgment in location can be corrected before construction. Poor judgment in construction is kin to bad management. The bond holder wants to know that traffic expectations will be realized and net earnings (gross less operating expenses and fixed charges) assured. It is therefore necessary that the proposition be handled in a most thorough and business like manner and facts presented to show it to be a safe investment.

A logical method of procedure in building an interurban railway is for the local people who are interested in its construction to form an association to look into the matter thoroughly. The members of this association will pay for the preliminary report, to ascertain the important fact of probable, not possible, net earnings. This report being satisfactory, the next step is to have surveys made and prepare careful financial and engineering reports in sufficient detail to enable the outside investor to form a correct mental image of the proposition. As a rule the association should provide sufficient money for securing rights of way and to defray the general expenses attendant on underwriting the bonds. Bond underwriters usually require that from 20 to 25 per cent of the money for construction be obtained locally. It is further required that part or all of this money be actually expended upon construction work before applying to the underwriters. After the bond underwriters have been called for about 20 per cent of their underwriting, it is generally possible to secure a loan on the bond underwriting to carry the work to completion. The financing is of course simplified when private interests build the road without stock subscriptions or underwriting, but the probable net earnings can never be forgotten, as they furnish the whole incentive to build such roads.

The outside investor must be assured of a safe return on his investment within a period of at least one year after commencement of operation. If the preliminary report is favorable, surveys should be made to show right of way and obtain detail estimates of showing cost of construction and cost of operation. In addition there should be a statistical report showing in detail business conditions in the tributary territory, all data and information being supplemented by photographs. This statistical report is really an enlargement of or addenda to the preliminary report. It adds information obtained from the result of the surveys and rights of way canvass and data collected in a leisurely manner as compared with the preliminary report.

The interurban railway should be built as much as possible on private right of way and should seek to obtain as short entrance as possible into the termini of the line. It is desirable, especially if there be competing steam lines, to reach the center of a terminal city, but it is essential that the entrance be as short as possible. One line 65 miles long consumes 15 per cent of the schedule time in getting out of the larger city. In small intermediate towns it is not so essential that the center be reached. It is desirable to run on private right of way as much as possible, so if it is necessary to pass along the built up main street to reach the center of the town, it is in many cases best to pass through the edge of the town instead. To follow highways means slower running time and increase in number of accidents.

When paralleling steam lines the interurban must be built for high speed service. This means heavy rails, probably catenary trolley construction, in some cases block signal system, reserve equipment in power plant, and large cars. Without competition high speed is a smaller factor and the line to build is that one which will best meet traffic conditions and soonest insure net earnings.

Mr. Billingsley recommends for southern conditions three systems of motive power, viz.:

600 volt D. C. system.
1,200 volt D. C. system.
Single phase A. C. system.

The 600 volt D. C. system operates at a trolley voltage of 600 and most of the installations built use this system. Often the interurban railway is of such length as to require substations and in such case A. C. power is transmitted to these substations and transformed by means of rotary converters or motor generator sets.

The 1,200 volt D. C. system operates at a trolley voltage of 1,200 volts and has been made possible by the development of the commutating pole motor. Within the past three years several roads have been built using this system, conspicuous among which is the Indianapolis-Louisville line, which operates a 41 mile section without the use of substations.

The single phase A. C. system uses single phase A. C. motors operating with a high trolley voltage stepped down through transformers on car to a suitable voltage for the motors. In general there are no reasons why the trolley should not carry a potential of 11,000 volts, under which conditions a very heavy service (as in the case of heavy freight traffic) can be handled without an excessive amount of copper in the transmission conductors. There have been many single phase systems built within the past few years.

*Manager, The Fred A. Jones Co., Engineers, New Orleans, La.

Appraised Value of the Steam Railways of Wisconsin.

In our issue of June 26, 1907, was published the appraised value of the railways of Wisconsin, as of June 30, 1903. The following is a brief summary of the last valuation, as of June 30, 1907, which was completed in December, 1908, under the direction of Prof. W. D. Pence, Engineer of the Wisconsin Tax Commission and of the Railroad Commission. Table I is a summary of the first and the last valuations.

TABLE I. COMPARISON BETWEEN FIRST AND FIFTH WISCONSIN STEAM ROAD VALUATIONS.

	Valuation as of date. June 30, 1903.	June 30, 1907.
Number of railroad properties included ..	47	52
Total length, road mileage	6,656.88	7,090.39
Cost of reproduction—		
Property, new, total....	$205,760,519	$244,128,868

Cost of reproduction—		
Existing condition, total	169,758,518	196,239,314
Reproduction cost per mile of line—		
Property, new	30,900	34,400
Present value per mile of line	25,500	27,700
Per cent condition	82.5	80.3

The mileage on June 30, 1907, was as follows:

Main line	6,549.69
Main line, joint, ½ interest	9.80
Branch line	551.83
Branch line, joint, ½ interest	9.07
Total main and branch line	7,090.39
Second track	431.57
Third track	40.62
Fourth track	35.54
Total "trackway"	7,598.12
Spurs and sidings	2,523.33
Spurs and sidings joint, ½ interest	52.83
Spurs and sidings joint, ⅓ interest	4.32
Spurs and sidings joint, ⅔ interest	0.29
Crossovers	0.04
Grand total track	10,178.93

The total appraised values, new and in present (depreciated) condition, as of June 30, 1907, are as in Table II.

TABLE II.—VALUATION NEW AND AND IN DEPRECIATED CONDITION OF WISCONSIN RAILWAYS.

	Cost of reproduction. New.	Present condition.
1. Right of way and station grounds	$ 26,339,419	$ 26,339,419
2. Real estate	.....	.....
3. Grading	39,391,307	39,391,307
4. Tunnels	797,412	776,972
5. Bridges, trestles and culverts	18,616,486	14,688,887
6. Cross ties and switch ties	11,181,399	5,826,021
7. Rails	30,111,358	24,605,740
8. Track fastenings	5,254,013	3,367,649
9. Frogs, switches and crossings	1,179,056	743,079
10. Ballast	5,768,084	3,969,476
11. Track laying and surfacing	3,345,555	2,770,572
12. Fencing	1,611,775	826,512
13. Crossings, cattle guards and signs	440,896	269,880
14. Interlocking and signal apparatus	613,354	538,801
15. Telegraph lines	167,840	99,587
16. Telephone lines and distribution system	89,639	81,439
17. Station buildings and fixtures	3,918,995	2,902,418
18. Shops and round houses: powerhouses and car barns	3,892,882	3,048,497
19. Tools	144,419	86,384
20. Water stations	1,345,218	986,357
21. Fuel stations	466,745	351,432
22. Grain elevators	826,706	612,171
23. Warehouses	262,539	200,278
24. Docks and wharves	3,645,907	2,956,821
25. Miscellaneous structures	2,106,101	1,409,949
26. Sub-stations	45,130	44,119
Totals of all the above items	$161,562,235	$136,893,767
27. Engineering, superintendence, and legal expenses 4.5% of all the above items.	$ 7,270,300	$ 6,160,220
28. Locomotives	11,531,174	7,331,573
29. Passenger equipment	5,317,465	3,193,301
30. Freight equipment	30,944,348	20,479,648
31. Miscellaneous equipment	901,935	588,260
32. Ferries and steamships	.....	.....
33. Electric plants	161,476	146,114
34. Shop machinery and tools	1,573,000	1,186,369
Totals of all the above items	$219,261,933	$175,979,252
35. Freight on construction material, 0.7% of items 1-34	1,523,656	1,209,539
36. Interest during construction, 3%: Organization,[1] contingencies, 5.5%; in all,[2] of items 1-34	20,738,225	16,463,297
37. Stores and supplies on hand for use in Wisconsin	2,605,054	2,587,226
Totals	$244,128,868	$196,239,314

[1]1% and 1.5%.
[2]9.5% and 10%.
Includes dock property and all lines under construction.

Dividing each of the items in the first column of Table II by 7,090, we have the following cost per mile of roadbed:

	Per mile of roadbed
1. Right of way, etc.	$ 3,714
2. Real estate	.....
3. Grading	5,554
4. Tunnels	112
5. Bridges, etc.	2,625
6. Ties	1,577
7. Rails	4,246
8. Track fastenings	741
9. Frogs, etc.	166
10. Ballast	813
11. Track laying and surfacing	472
12. Fencing	227
13. Crossings, etc.	62
14. Interlocking and signal	86
15. Telegraph	24
16. Telephone	13
17. Station buildings	553
18. Shops and roundhouses	548
19. Tools	20
20. Water stations	189
21. Fuel stations	66
22. Grain elevators	121
23. Warehouses	37
24. Docks and wharves	514
25. Miscellaneous structures	297
26. Substations	6
Total of above	$22,783
27. Engineering	$ 1,025
28. Locomotives	1,625
29. Passenger equipment	750
30. Freight equipment	4,363
31. Miscellaneous equipment	127
32. Ferries, etc.	...
33. Electric plants	23
34. Shop machinery and tools	222
Total of above	$30,918
35. Freight on constr. mtls.	215
36. Interest during construction, contingencies, etc.	2,924
37. Stores on hand	367
Grand total	$34,424

Since there are 1.435 miles of track per mile of roadbed, each of the above items should be divided by 1.435 (or multiplied by 0.7) to obtain the cost per mile of track. For example, item 11, "Track laying and surfacing," is $472 per mile of roadbed, which is equivalent to $0.7 \times \$472 = \$331$ per mile of track, which, by the way, is an exceedingly low estimate of cost.

A Method of Determining Relative Economy with Rules and Tables for Practical Computation.

BY S. S. ROBERTS.*

Possibly the question most frequently occupying the thoughts of the present day railroad man and engineer is: Which is the most economical? The answer is dependent upon many factors, of which time is probably the most uncertain, and good judgment is by no means the least important. Since the future cannot be foretold with certainty and since judgment may err, an absolutely correct answer may not always be obtained. It is not the purpose of this article, therefore, to attempt to lay down infallible rules, but to outline rules which are in use and to present convenient tables based on them which, coupled with common sense, reduce the probability of mistake in the final decision.

So much has already been written by others on the subject of relative merit or relative economy, that to outline again those things that enter into its consideration may seem plagiarism. The writer wishes at once to purge himself of such a charge by claiming no special originality for anything following and to lay claim to the reader's consideration only through the accompanying tables which he believes convenient, simple and time-saving, and to contain some parts differently presented than any others the writer has seen.

To the average young engineer the request to compare two or more articles on a basis of "Capitalization"; "Annual Cost"; "The Present Value of the Ultimate Amount" for a fixed term of years; or on the basis of "Equivalent Cost" is distressing; and from the character of requests frequently made by the older engineers of their subordinates, it would seem that even some of them are not entirely familiar with the relationship between the different methods named, and are skeptical of the fact that the order of merit will be the same no matter which one of these processes is employed.

There are four elements always considered in determining relative economy or merit.

(1) First Cost: Which should include the cost of raw material, cost of fabricating, cost of transportation and handling, and cost of placing or erecting.

(2) Life: That is the time elapsing between the date of installation and the date when it becomes necessary to renew or replace.

(3) Cost of replacing or renewing.

(4) The cost of money or rate of interest.

To these may be added:

(5) Maintenance: Which is the cost of repairs or depreciation, and

(6) Salvage: The scrap value of the article at the close of its period of usefulness.

In the formulas, developed later, the first five elements only shall be considered.

On the basis of "Capitalization" that article is considered the cheapest which, present conditions prevailing, will require the least amount to install it and to be set aside now at compound interest to reproduce it for ever.

The capitalization is made up of

(a) First cost $= C$.

(b) The amount at simple interest necessary to produce annually the cost of maintenance $= M' = \frac{M}{R}$.

(c) The amount at compound interest necessary to produce in interest during the life of the article the first cost of it $= C' = \frac{C}{(1+R)^N - 1}$

Total capitalization equals

$$(C + M' + C') = \frac{C(1+R)^N}{(1+R)^N - 1} + \frac{M}{R} \quad \ldots\ldots (1)$$

in which N = the years of life of the article, $R = \frac{\text{rate of int.}}{100}$, and M the cost per year to maintain.

As frequently occurs, the cost of maintenance is the same for the articles considered, and may be neglected, then

$$\text{Total capitalization} = \frac{C(1+R)^N}{(1+R)^N - 1} \quad \ldots\ldots (2)$$

On the basis of "Annual Cost," that article is the cheapest which shows the least annual cost. The annual cost being made up of

(a) Interest on first cost $= I = CR$.

(b) The amount that must be spent annually for maintenance $= M$.

(c) The amount that must be set aside annually at compound interest to provide for renewal at expiration of the life of the article, equal to $F = \frac{CR}{(1+R)^N - 1}$

Total annual cost =

$$(I + M + F) = \frac{CR(1+R)^N}{(1+R)^N - 1} + M \quad \ldots\ldots (3)$$

$$\text{Neglecting maintenance} = \frac{CR(1+R)^N}{(1+R)^N - 1} \quad \ldots\ldots (4)$$

On the basis of "The Present Value of the Ultimate Amount" where each article is considered in use for the same period of time and where the period of time considered is a common multiple of the lives of the articles considered.

The Ultimate Amount (UA) at compound interest of the first cost (C) occurring now and recurring every N years for T times or periods of N years each is

$$U.A. = \frac{C(1+R)^N}{(1+R)^N - 1} \times [(1+R)^{NT} - 1] \quad \ldots\ldots (5)$$

The amount set aside now (Present Value) which at compound interest will equal the accumulation (UA), in NT years is

$$P.V. = \frac{U.A.}{(1+R)^{NT}} = \frac{C(1+R)^N}{(1+R)^N - 1} \times \frac{(1+R)^{NT} - 1}{(1+R)^{NT}} \quad \ldots\ldots (6)$$

The difference in the present value of two articles as obtained from equation (6) plus or minus the difference in cost of maintenance gives the present advantage of one over the other.

On the basis of "Equivalent Cost." One article is considered to cost the same as another when the capitalization or annual cost of one

is equal to the capitalization or annual cost respectively of the other, or

$$C' = \left[\frac{C(1+R)^N}{(1+R)^N - 1} \quad \frac{(1+R)^{N'} - 1}{(1+R)^{N'}}\right] + \left[\frac{M \quad M'}{R} \cdot \frac{(1+R)^{N'} - 1}{(1+R)^{N'}}\right] \quad . \quad (7)$$

neglecting the cost of maintenance

$$C' \quad \frac{C(1+R)^N}{(1+R)^N - 1} \quad \frac{(1+R)^{N'} - 1}{(1+R)^{N'}} \quad \cdots\cdots (8)$$

where C' is the cost of one article of life of N' years and where C is the cost of the other article with life of N years.

From inspection of equations (1) and (3) or (2) and (4) it is at once seen that the "Annual Cost" is simply the product of R times the "Total Capitalization," that is, it is the capitalization placed at simple interest.

From inspection of equations (2) and (5) it will be seen that the "Ultimate Amount" is simply the interest at compound interest of the "Total Capitalization" for the period of time concerned.

From inspection of equation (6) the "Present Value of the Ultimate Amount" is simply the capital sum which placed at compound interest now together with the interest, will at the close of the period of time considered be equal to the interest on the "Total Capitalization" for the same period.

Further, from equation (8), if N' is a multiple of N and equal to NT, the "Equivalent Cost" for the article lasting N' years is found to be equal to the "Present Value of the Ultimate Amount" of the article lasting N years considered in use for N' years.

From these comparisons it will be seen that the same order of merit will be obtained no matter on what basis the comparison is made.

If the cost of renewal of the articles should be the same as the present first cost, or if the future cost could actually be determined and considered, and if the estimated life could be actually realized, then the mathematical comparisons given would be exact. If an article now of lesser first cost and life were known to be unattainable or attainable at prohibitive cost at the end of its life, but which now showed a saving over a second article, and if the increase in cost of the second article were known and shown to be less than the accumulation of the saving placed at compound interest for the life of the first, the rules would again be certain guides.

The ideal conditions outlined above do not prevail in practice. The time element, life, is always uncertain. Not only because it is impossible to say exactly how long an article will last but also because of the possible and probable inability to enjoy the use of an article to the full extent of its actual life. This may be illustrated by practice in renewing cross ties. If treated ties are used, many railroads are not in a position to say positively that the character and efficiency of treatment is as estimated. Granted that it is. The ability in service to get the entire life out of the tie is doubtful. The most universal practice in maintenance is very probably a rotative method of overhauling. That is, every one and a half or two miles of track will have to be "put up," generally overhauled and repaired, about every third or fourth year, and an effort is made to distribute the old and new cross ties so that one tie out of every three or every four ties will have to be renewed every third or fourth year. Now, if in the judgment of the foreman overhauling such a section of track, a tie will not last until the time of the next general overhauling, but will last for say two years, he will leave it in track. If on the other hand, the foreman thinks the tie has remaining only about a year of life, he will take it out. Very good policy, because it is possibly more economical to remove the tie at the loss of a year of its usefulness than to disturb the bed of the track so frequently. But, as to whether a tie will last one year or two years longer is a matter of very doubtful judgment, with the tendency of the track men to be on the safe side, and it is believed that it is more difficult to judge correctly the treated ties, and that more mistakes are made against the ties of long life and very gradual deterioration than in the case of ties of short life and rapid deterioration.

Again of the conditions of practice may be cited a road struggling for existence and desiring to purchase ties. A tie of long life and great first cost may, from every theoretical point of view, be shown to be economical. Yet the large expenditure necessary to purchase it would bankrupt the road.

So that in the end common sense or good judgment and a knowledge of all local and physical conditions play an important part in consideration of relative economy. Good judgment alone without the backing of mathematical assistance is no more or less than a guess. Reliance on the mathematical equations alone is of less value. However, by a combination of the two, the best results attainable should be had. An opinion based on good judgment substantiated by mathematical demonstration should certainly be worthy of consideration, and the better the judgment displayed in placing a proper valuation upon the elements of the mathematical equations, the more surely are the chances of error in the result decreased.

The accompanying tables I and II are intended to offer a convenient means for the combination of one's judgment and the mathematical equations given above. They are based on equations (2), (4) and (8) where the cost of maintenance is neglected.

There are two tables computed on a basis of money at 4 per cent and 5 per cent respectively and covering periods of from 5 to 25 years inclusive. Examples: With interest rate for the money at 5 per cent.

(1) To find the amount, principal plus interest, at compound interest of $1,000 for 14 years. From column "Amount," line 14: Amount = $1,000 × 1.980 = $1,980.

(2) To find the interest on $1,000 at compound interest for 14 years. From column "Interest," line 14: Interest = $1,000 × 0.98 = $980.

(3) Given an accumulation of $1,980 at compound interest at the end of 14 years. To find the principal or present value. Column "Amount," line 14: Present value = $1,980 ÷ 1.980 = $1,000.

(4) To find the capital sum that at compound interest for 14 years will produce interest amounting to $980. Column "Interest," line 14: Capital sum = $980 ÷ 0.980 = $1,000.

(5) To find the total "Capitalization" of a cross tie that costs 55 cts. in the track and will last 7 years. From column "Capitalization," line 7: $0.55 × 3.456 = $1.901.

(6) To find how long a cross tie should last that costs 55 cts. and has a capitalization of $1.901. (1.901 ÷ 0.55) = 3.456. Under column "Capitalization" on line 7 is the corresponding "Capitalization"; therefore the tie should last 7 years.

(7) To find the "Annual Cost" of the tie given in example (5). From column "Annual Cost," line 7, $0.55 × 0.173 = $0.095.

(8) To find how long a tie should last that costs 55 cts. and has an "Annual Cost" of $0.095. (0.095 ÷ 0.35) = 0.173, and under column "Annual Cost" on line 7 is the cor-

responding value, therefore the tie should last 7 years.

(9) To find how much may be paid for a tie lasting 16 years to show the same merit as a tie lasting 7 years and costing 55 cts. From column 7 and line 16: $0.55 \times 1.873 = \$1.03$.

(10) To find how much may be paid for a tie lasting 7 years to show the same merit as a tie lasting 16 years and costing $1.03. From column 16 and line 7: $\$1.03 \times 0.534 = \$0.55$.

(11) To find how long a cross tie should last that costs $1.03 in order to be as economical as a tie that costs 55 cts. and lasts 7 years. $(1.03 \div 0.55) = 1.873$. Under column 7 the corresponding value is found on line 16; therefore the tie costing $1.03 should last 16 years.

(12) To find how long a tie that costs 55 cts. should last in order to be as economical as a tie that costs $1.03 and lasts 16 years. $(0.55 \div 1.03) = 0.534$. Under column 16 the corresponding value is found on line 7; therefore the tie costing 55 cts. should last 7 years. When the life (N') of one article is a multiple of the life (N) of another and both are considered in use for the same period of time; equal to the life (N') of the more lasting of the two.

(13) A tie costs 42 cts. in the track and lasts 5 years. A second tie costs 67 cts. in the track and lasts 10 years, and both are considered for a period of 10 years on a basis of the "Present Value of the Ultimate Amount." From the tables, column "5," line 10, the amount that may be given for a tie that will last 10 years to be as economical as the 5-year tie is, $\$0.42 \times 1.783 = \$0.75$. The present advantage of the tie lasting 10 years over that lasting 5 years is, $\$0.75 - \$0.67 = \$0.08$.

(14) To compare the merit of a tie costing 90 cts. in the track and lasting 5 years with a steel tie costing $2.44 in the track and lasting 25 years. When the steel tie weighs originally 180 lbs. and has remaining 40 per cent of its original weight when it is renewed. The scrap value of the steel being $11 per ton. Interest rate for money 4 per cent. From the 4 per cent table, column "5," line 25. There may be given for a tie lasting 25 years, $(0.90 \times 3.509 = \$3.158$ to be of equivalent value to the tie lasting 5 years and costing 90 cts.

There is salvage on the steel tie amounting to $\frac{180}{2240} \times 0.40 \times \$11 = \$0.347$ at the end of 25 years. The present value of this salvage is from column "Amount," line 25: $(0.347 \div 2.666) = \$0.130$. So that the present cost of the steel tie may be considered $2.44 — $0.13 = $2.31.

The advantage of the steel tie is therefore $3.158 — $2.31 = $0.848, where tie for tie is used.

(14a) In cases where opinion prevails that it is necessary to use 20 steel ties to a 33-ft. rail where 18 wooden ties answer the same purpose, then the advantage of the steel tie is

$$\frac{(\$3.158 \times 18) - (\$2.31 \times 20)}{20} = \$0.531 \text{ per tie.}$$

Or, a steel tie lasting 25 years, having the salvage given above, would have to cost more than $2.84 before it becomes less economical than the wooden tie lasting 5 years and costing 90 cts.

Or, from the table, column 25, line 5: If the steel tie costs $2.31, then with equal economy, tie for tie, there may be given for the 5-year wooden tie, $(\$2.31 \times 0.285) = \$0.658$.

Or, where 20 steel ties are used to 18 wooden ties, $(\$2.31 \times 0.285) \times \frac{20}{18} = \$0.731$

That is to say, the wooden tie lasting 5 years would have to cost less than 73 cts. to be more economical than the steel tie lasting 25 years and costing $2.44 with the salvage assumed above.

The examples given above have been taken at random without having in mind any specific case in actual practice, and are intended to serve only for the purpose of illustrating the working of the tables.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Methods of Filing Books, Pamphlets, Trade Catalogs and Periodicals for Small Private Libraries or Information Departments.

The development of the special library, or information department, in engineering, contracting and industrial fields has marked, and has in part caused, a considerable increase in business efficiency. In any modern office or concern dealing with technical problems, the bulk and variety of the data that need to be preserved speedily get beyond the capacity of the filing cabinet. Something more efficient is needed that can hold a great variety of material clearly classified and instantly available, and this demand for the something more efficient is being filled to an increasing degree by the information department or "special library" organized with reference to the particular needs of the organization it serves. The multiplication of these special libraries, it may be noted, has led to the forming of an association of special libraries, numbering over a hundred members, which impressively denotes the growing importance of this new tool.

A very suggestive example of the special library for a particular field is that given in a recent paper before the convention of the American Chemical Society. Therein Mr. Guy E. Marion of the Arthur D. Little, Inc., laboratory of engineering chemistry, describes the "Information Department" under his charge, which is attached to the Little laboratory. As an explanation of methods which have proved of high practical efficiency in handling a great mass of material bearing on a wide range of engineering-chemical matters, Mr. Marion's paper is full of suggestions that will prove helpful and stimulating to engineers who have not yet realized the value and the feasibility of some such system for preserving data of various sorts. Describing the organizing and handling of the material, Mr. Marion says:

Sources of Material.—Material is obtained chiefly through five channels: (1) The purchase of special books or pamphlets to meet definite requests; (2) through the mailing lists of outside concerns that send their advertising literature from time to time; (3) through the kindness of individual acquaintances at various points who desire to exchange results; (4) from chance notices appearing in the technical periodicals, which prompt us to initiate ourselves the getting of the information in question; and (5) from the calls of clients and salesmen who may leave with us at their visits information of one kind or another. These are outside sources. The material produced within cur own business of course comes to the library through the regular office routine.

Classification.—All of this material then on its receipt falls into one of the following six groups: (1) Books, (2) pamphlets, (3) trade catalogues, (4) special data, (5) periodicals and (6) the museum collection.

Books.—The books are classified by the Dewey decimal system, which long ago proved its claims in the public libraries. It serves our purposes very well indeed, and maintains uniformity with the best prevailing library practice in the majority of public libraries. By its use, like books stand together on the shelves and those related stand closely by. It permits of perfect intercalation of new material upon the shelves in proper order. Supplementing the Dewey subject number, each book has its Cutter's author number. The Kate E. Sanborn arrangement of C. A. Cutter's alphabetic order table is used for assigning these numbers. All books are entered in an accession book on their reception, thus keeping accurate data on each volume.

Pamphlets.—Pamphlets receive treatment similar to that of the books as far as their numbering goes, but in order to keep this material in a distinct class by itself, the small letter p is used before the classification number. The pamphlets are then placed in regular pamphlet boxes on the shelves.

Trade Catalogs.—Trade catalogs receive a somewhat different treatment. This is the most objectionable class of material entering the library, owing to its entire lack of uniformity. The best practical treatment has been found to be a shelf arrangement, in which all the small material is inclosed in envelopes (9⅝x11¾ ins., without flap, opening on the long side) and standing in one alphabet from a to z. To each company's catalogue is assigned a Cutter number; thus the catalogue of the Sturtevant Mill Co. is S 936, which places it at one and the same time in a strictly alphabetical and numerical decimal order. This arrangement has the additional advantage of allowing those coming to the library seeking a particular concern's catalogue to go directly to the shelves without consulting an index.

Special Data.—Special data make up a somewhat miscellaneous class of material composed of an accumulation of newspaper clippings, reviews of articles, results of personal interviews, special investigations, data culled from correspondence, and many other sources. The greater part of it is copied on correspondence size sheets and placed in a vertical file. A small letter s preceding the number keeps this material distinctly in one class. The arrangement here is also by subject with the use of the decimal system.

Periodicals.—The class of periodicals is made up of a selected list of about 50 scientific and technical publications, both foreign and domestic. Many of these are purchased directly, while others are received with memberships in the different learned societies. For convenient reference all the periodicals are given symbols such as E R J for "Electric Railway Journal" and P T J, "Paper Trade Journal." Thus with the date of issue known, a certain reference can be easily and briefly made to any article. When the periodicals are later bound, as many of the better ones are, they of course leave this class and become books. As for the others, after clipping, they are thrown away.

Muscum.—The museum collection is made up of a large assortment of samples obtained from various sources, clients, etc.; for example, fibrous materials, mineral matter, special papers, artificial silks, standardized steels and irons, paper making chemicals, electric railway materials, etc., etc. To each individual sample is given a consecutive number, preceded by a small letter m, which serves to keep this material in one group by itself. The material is filed in glass cabinets, where it is on constant exhibition, and proves, at least to visitors, a source of lively interest.

Color Scheme.—In the actual handling of this material a color scheme is used. White tags are placed on the books, salmon on the pamphlets, blue on the catalogues, yellow on the special data, green on the periodicals and cherry on the museum material. This is found to be helpful in the work, always aiding the eye in the rapid classification of material, and preventing often the return of material to the wrong place.

Accessioning.—Now as to the processes through which this bulk of material passes. Everything entering for permanent file is first accessioned, then catalogued and filed. The accessioning of the books has already been

described; the other classes are accessioned on sheets kept for one week only, from which the information is later transferred to the weekly bulletin which will be described below. This does not apply to the periodicals which are checked upon a special card system as they are received, nor to the museum articles, which are not accessioned.

Cataloging.—The classifying takes place next, which is followed as soon as finished by the indexing. Author, title and subject cards are made out in nearly every case and often several subject cards. The cards completed, the materials go to their respective files, and the cards to the library index.

Card Catalog.—This index is one large dictionary catalog from a to z, and now numbers between 30,000 and 40,000 cards. These are all standard 3x5-in. library cards, and the entire index is liberally supplied with guides for the searcher. After locating the proper material wanted in the index, the nature of the call number on the card will always indicate the group in which the material itself will be found. This has already been explained in earlier paragraphs upon the different groups of material, by the use of the small letters, s, p, m, etc., as symbols in the call numbers. A distinctive feature of filing cards is the placing of them first in their proper places, without the removal of the rods from the drawers. A second party then goes through the cabinet, verifying them and dropping them into their permanent arrangement.

Charging.—The charging system carries out the color scheme. We have a small tray with the necessary compartments, in which narrow slips are used for keeping records of the material out of its regular place. White slips receive the book charges, salmon the pamphlet, blue the catalogue, and so on. On each slip is written the call number of the material, the initials of the borrower, and the date on which the loan is made. All material which is returned during the day is kept together in one place and is returned to the files the first thing the following morning, the charge slips being removed at the same time from the charging tray.

Correspondence.—For indexing purposes all of the correspondence of the various departments of our laboratory goes to the library before being filed. This is the regular channel through which all mail must go, and nothing is filed until noted by the library with its library stamp. This enables the library to pick out and index such useful bits of information as would otherwise be lost sight of.

We have a form called "inquiry blanks," printed on paper of a distinctive color. A pad of these blanks lies on nearly every desk in the various departments about the laboratory. When a need for information arises in any department, one of these forms is filled out and sent to the library, whence it becomes our duty to provide an answer at the earleist possible moment. These slips are numbered consecutively as received, and after going to the accounting department for the distribution of their time charges, are returned to the library and kept in consecutive order. They serve thereafter as memoranda from which the answers can be readily found in case the inquiries are duplicated later from other sources, for each slip is filled out with the sources from which any information has come.

Annual Meeting of the Illinois Society of Engineers and Surveyors.

The annual meeting of this society will be held in Cairo, Ill., Jan. 26 to 28. The Halliday Hotel will be headquarters and all the meetings will be held in Armory Hall.

A feature of the meeting will be the topical discussions, a profitable one at past meetings and of great interest to the members. For the present meeting 20 topics have been suggested, all being of vital interest to civil engineers and surveyors, especially those practicing in the smaller communities. Discussions on these topics are not limited to members and a printed list will be sent to all inquirers, written discussions being invited. The secretary, Mr. E. E. R. Trotman, 1636 Monadnock Block, Chicago, will present written discussions sent in by those unable to attend.

Reports will be made by the committees on sewers, roads and pavements, drainage, records of bridges on public highways, surveying, government control of land surveys, railways, metric system, measures of length, and legislation.

The following papers have been announced: The Relation of the Typhoid Fever Death Rate to the Water Supplies of Illinois, E. Bartow; Municipal Engineering Work at Cairo, W. B. Thistlewood; Chicago's Sidewalk Problem, N. E. Murray; Materials and Workmanship in Street Paving, W. W. Marr; Instruction in Hydraulics and Water Supply Engineering at the University of Illinois, Geo. C. Habermeyer; Sewage Disposal Plants for Small Institutions, Geo. C. Habermeyer; Recent Practice in Sewage Purification, W. S. Shields; Reinforced Concrete Construction, A. J. Widmer; Reinforced Concrete Aqueducts, H. E. Reeves; Instruction in Road and Pavement Construction at the University of Illinois, R. B. Slippy; Tests of Road Materials, R. B. Slippy; Roads in Central Illinois, J. O'Brien; The Drainage and Protection of Lands Subject to Overflow, C. W. Brown; The Legal Liabilities of Levee and Drainage Districts, J. V. Waddell; The Tallahatchie Drainage District, A. L. Dabney; Water Supply and Drainage Investigations in Illinois, R. I. Randolph; The Maintenance of Open Ditches, E. H. Cowan; The Highway Work of the U. S. Government, by a U. S. road engineer; Observations on Engineering in Europe (illustrated), F. O. Dufour; Developments in Road Construction, A. N. Johnson; The County Surveyor, P. T. Hicks; The Cairo and Thebes Railway, G. F. Dewey; The Cairo Electric Railways; Steel and Concrete Bridge Work on the Illinois Central Railway, R. E. Gant; Monazite and Its Uses, S. K. Atkinson; Railway Engineering at the University of Illinois, S. S. Roberts; Mining Engineering at the University of Illinois, H. H. Stoek; The St. Louis and Cairo Deep Waterway, J. W. Woerman. Following Mr. Woerman's paper there will be discussions on river traffic.

Processes for the Preservative Treatment of Timber and Approximate Costs of Treatment.

BY G. B. SHIPLEY.*

The evolution of timber preserving processes in this country within the last ten years has developed many new methods of treating ties, piling, timber, poles, cross arms, mine timbers, etc., and a great many antiseptics or compounds are being proposed, but the subject is of such vital importance that the leading organizations are backward about experimenting. Consequently the processes actually employed may be subdivided into only two methods and these are the full cell and partial cell treatments. The full cell treatment consists of impregnating the wood fibres and filling the cells with the antiseptic, whereas the partial cell treatment consists of impregnating the wood fibres only. These two methods are sometimes confused with processes or the matter in which the treatment is performed.

The treatment of wood depends upon where the wood will be used, the climatic conditions, the permissable cost of treatment and the wood structure. If first class wood is to be used for such work as docks around salt water, telegraph poles, building foundations or for railroad ties, where there is no mechanical wear, the full cell method is best, but if the wood is soft and not protected from mechanical wear, then the partial cell method will be satisfactory for the reason that with the latter method the chemical life will be equivalent to the mechanical life.

The important processes that are in use in this country and which may be classed under the full cell method are the burnettizing, wellhouse, full cell creosote and card processes and those which may be classed under the partial cell method are the Reuping, Lowry and absorption processes. These processes, with the exception of the absorption process, are manipulated by mechanical contrivances, such as pressure pumps, vacuum pumps and air compressors and can be controlled to suit the wood structure, while with the absorption process the treatment is governed by temperature and atmospheric pressure, therefore is limited to certain woods.

Burnettizing Process.—This is often referred to as the zinc chloride process and consists of impregnating the wood fibres with a solution containing ½ lb. of dry zinc per cubic food of wood and is operated as follows: The wood is first air seasoned in the open, or steamed in retorts to expel the moisture, then a vacuum is produced and maintained until the solution is introduced and the wood is completely submerged, the pressure is then increased to about 100 lbs. or 125 lbs. per sq. in., by pumping in additional solution until the required penetration and impregnation is obtained, when the solution is drained from the retort. The approximate time required for the process is:

	Hrs.	Mins.
Steaming to 20 lbs. pressure	0	30
Steaming, 20 lbs. to 35 lbs. pressure	3	30
Blowing off steam	0	15
Vacuum	0	45
Solution to about 100 lbs. pressure	0	15
Solution maintained to 100 lbs. pressure	1	15
Forcing back solution	0	15
Total cycle	7	15

If the steaming time is reduced 2 hrs., then the total cycle is 5 hrs. 15 mins.

Wellhouse Process.—This is often referred to as the zinc tannin process. It consists of impregnating the wood fibres with a hot solution containing about ½ lb. of dry zinc chloride plus ½ per cent of glue or gelatine per cubic foot of wood, then following by injecting a second solution containing ½ per cent of tannic acid. The purpose of the tannin is to solidify the first injection to prevent leaching.

The wood is first air seasoned in the open or steamed in retorts to expel the moisture, then a vacuum is produced and maintained until the solution is introduced and the wood is completely submerged, the pressure is then increased to about 100 to 125 lbs. per sq. in. by pumping in additional solution until the required penetration and impregnation are obtained, when the solution is drained from the retort and the second movement takes place by filling the retort with a solution containing tannic acid and increasing the pressure by pumping in additional solution at about 100 or 125 lbs. per sq. in. until the required penetration is obtained, when the solution is drained from the retort. The approximate time required is:

	Maximum Time. Hrs.	Mins.
Steaming to 20 lbs. pressure	0	30
Steaming, 20 to 35 lbs. pressure	3	30
Blowing off steam	0	15
Vacuum	0	45
Solution and glue to 100 lbs. pressure	0	45
Solution and glue maintained at 100 lbs. pressure	1	15
Forcing back solution and glue	0	15
Tannin introduced to 100 lbs. pressure	0	20
Tannin maintained at 100 lbs. pressure	0	50
Forcing back tannin	0	15
Total cycle	8	40

If steaming time is reduced 2 hrs., then the total cycle equals 6 hrs. 40 mins.

Absorption Process.—This is often referred to as the non-pressure process and consists of submerging the wood in a boiling preservative at a temperature of from 180° to 230° F., then following with a cold preservative as follows: The wood is first air seasoned in the open to reduce the moisture, then placed in either an open or closed receptacle where it is submerged in a hot preservative which expels the air and additional moisture; the receptacle is then drained and the wood submerged in a cold preservative. The first movement opens the pores or cells of the wood forming a vacuum within, while the second movement causes absorption due to the difference in temperature and atmospheric pressure. This process can be used in either open tanks or closed retorts. For treating the butts of poles, fence posts, piling and small quantities of ties the open tank is satisfactory, but for treating large quantities of material the closed retort is rec-

*477 Marshall St., Milwaukee, Wis.

ommended where thorough impregnation is desired. The time of treatment is as follows:

Green Timber:
Boiling in hot preservative from 8 to 10 hrs.
Bath in cold preservative from 8 to 16 hrs.
Total time of treatment, 16 to 26 hrs.

Seasoned Timber:
Boiling in hot preservative from 3 to 6 hrs.
Bath of cold preservative from 4 to 8 hrs.
Total time of treatment, 7 to 14 hrs.

With this process it is possible to impregnate a limited class of woods with about 6 to 12 lbs. of concrete oil per cubic foot.

Full Cell Creosote Process.—This consists of impregnating the wood fibres and cells of ties with 6 to 12 lbs. of creosote oil per cubic foot and timber and piling with 10 lbs. to 20 lbs. of creosote oil per cubic foot, as follows: The wood is first seasoned in the open or steamed in the retorts (generally both) to reduce the moisture and expel the sap; then a vacuum is produced and maintained until the creosote oil is introduced and wood is completely submerged. The pressure is then increased to about 100 to 125 lbs. per sq. in. and maintained until the desired penetration and impregnation is secured, when the creosote oil is drained from the tanks. In some cases a vacuum is produced and maintained at the finish to drain the surplus oil from the exterior of wood to prevent loss by drippage after the wood has been removed from retorts. The approximate time required is:

10-lb. Treatment.

	Hrs.	Mins.
Steaming to 20 lbs. pressure	0	30
Steaming, 20 to 35 lbs. pressure	3	30
Blowing off steam	0	15
Vacuum	0	45
Creosote to 100 lbs. pressure	1	30
Forcing back solution	0	15
Vacuum		30
Total cycle	7	15

If the steaming time is reduced 2 hrs., then the total cycle equals 5 hrs. 15 mins.

Rueping Process.—This is often referred to as a partial cell treatment and it is used principally in connection with creosote oil. It consists of forcing compressed air into the pores or cells of the wood and at a higher pressure creosote oil without relieving the air pressure and upon relieving the combined pressure the air expands and forces out the surplus oil, leaving wood fibres impregnated. The wood is first air seasoned in the open or steamed in the retorts (sometimes both) to reduce the moisture; then a vacuum is produced and next the air is compressed to from 80 to 100 lbs. per sq. in., thus filling all the wood cells with compressed air and by air equalizing reservoirs or pumps the retorts are filled with oil without releasing the air pressure. The oil pressure is thus started at from 80 to 100 lbs. per sq. in. and gradually increased to about 100 to 150 lbs. per sq. in., having the effect of compressing the air in the cells to a smaller volume and permitting about 10 to 12 lbs. of creosote per cubic foot to enter. The pressure is then released and the oil drained from the retorts; then a vacuum is produced, which causes the air within the cells to expand and forces the surplus oil out of the wood, leaving the wood fibres impregnated with from 4 to 6 lbs. of creosote per cubic foot. This process is best adapted for treatment of ties. The approximate time required using equalizing cylinders is:

	Hrs.	Mins.
Air to 80 lbs. pressure	0	30
Transferring oil	0	20
Creosote to 150 lbs. pressure	1	30
Maintaining 150 lbs. pressure	0	15
Forcing back oil	0	20
Vacuum	1	0
Maintaining vacuum	0	15
Draining	0	10
Total cycle	4	20

This time is based on thoroughly air seasoned ties.

Lowry Process.—This is often referred to as a partial cell treatment and it is used in connection with creosote oil. It consists of forcing creosote oil into the wood cells and then drawing out by vacuum the surplus oil, leaving only the wood fibres impregnated. The wood is first air seasoned in the open, then placed in retorts and submerged in creosote. The pressure is then applied by forcing in additional creosote of 10 to 12 lbs. per cu. ft. at about 180 lbs. pressure so as to saturate the pores and cells, after which the retort is drained and a quick vacuum is produced and maintained from 1½ to 2 hrs., leaving the wood fibres impregnated with from 4 to 6 lbs. of creosote per cubic foot. This process is used principally in the treatment of ties. The approximate time required is:

Ties thoroughly seasoned:

	Hrs.	Mins.
Creosote to 180 lbs. pressure	2	00
Draining oil from retort	0	10
Vacuum	2	00
Draining	0	10
Total cycles about	4	20

Card Process.—This process consists of impregnating the wood cells with an emulsion consisting of zinc chloride and creosote oil, as follows: The wood is first air seasoned in the open or steamed in the retorts (generally both) to reduce the moisture and expel the sap. Then a vacuum is produced and maintained for 1 hr., when the retort is filled with the hot emulsion consisting of ½ lb. of dry zinc and from 1½ to 4 lbs. of creosote per cubic foot. The pressure is then applied by forcing in additional emulsion at about 100 to 150 lbs. pressure per square inch, after which the retort is drained and a vacuum produced and maintained for about 30 min. to draw the surplus emulsion from the exterior of the wood to prevent loss by drippage when wood is removed from retort.

It is necessary to keep the emulsion constantly agitated to prevent a separation of the zinc and creosote and to accomplish this a centrifugal pump draws the emulsion from top of retorts and discharges into the bottom of the perforated pipe.

This process is used principally in the treatment of ties. The approximate time required is:

	Hrs.	Mins.
Steaming to 20 lbs. pressure	0	30
Steaming, 20 to 35 lbs. pressure	3	30
Blowing off steam	0	10
Vacuum	1	00
Emulsion to 120 lbs. pressure	1	00
Maintaining 120 lbs. pressure	1	30
Forcing back oil	0	15
Vacuum	0	20
Draining	0	10
Total cycle about	8	25

If the steaming time is reduced 2 hrs., then the cycle equals 6 hrs. 25 mins. If ties are thoroughly seasoned this time can be reduced to 4 hrs. 25 mins.

Cost of Treatment.—The prevailing rates for treating material with these processes depend upon locality, structure of wood, condition of wood; that is, whether it has been air seasoned or requires steaming, residual impregnation and quality to be treated; however it is safe to assume that the following is an average rate when taking creosote at $0.07 per gal. and zinc chloride at $0.04 per lb.

Process.	Per 7x9-in.x8-ft. tie.	Per 1,000 ft. B. M.
Burnettizing ½ lb. zinc chloride per cu. ft.	$0.17	$4.10
Wellhouse, etc.	0.23	5.50
Card	0.26	6.10
Rueping	0.32	7.60
Lowry	0.32	7.60
Absorption	0.33	7.80

The Fortieth Annual Meeting and Dinner of the Western Society of Engineers.

On the evening of January 12 the fortieth annual meeting and dinner of the Western Society of Engineers was held in the University Club building in Chicago. There were present 168 members and guests.

Mr. Andrews Allen in his retiring address reviewed briefly the growth of the organization, which now has nearly 1,200 members and is rapidly approaching the importance and standing of a national society. He dwelt upon the protection of the standing of full members and the need of an intermediate grade, matters now under consideration by the officers of the society. Steps are now being taken looking to the affiliation of local societies in other states or at least some arrangement whereby local sections may be organized among members not residents of Chicago. In the state of Illinois the law licensing architects bears very hard on structural engineers, who must either obtain the signature of a licensed architect on plans they draw for mill buildings or factories or must work on salary for licensed architects. The present condition is distasteful and the officers of the Western Society are now considering ways by which the present injustice can be removed, preferably by legislation similar to that now protecting architects. The dominant note in Mr. Allen's address after disposing of matters of detail was that of service. The duty of the unit to the whole and the sinking of self in the advancement of common interests was a text about which was woven a thoughtful and altruistic talk designed to stimulate the members to greater activity in their life work and, as an incident, the upbuilding of the Western Society of Engineers. Mr. Allen then introduced Mr. John W. Alvord, the president-elect for 1910.

Mr. Alvord thanked the members for permitting his name, the only monument it so far had being a tablet on a septic tank in an Illinois city, to be engraved on the rolls of the society as president in company with distinguished engineers who had other claims to fame as builders of bridges, railways and waterways. The municipal engineer was a man whose works were not in the eyes of observers and growing cities outgrew his works so it finally happened he was forgot. Mr. Alvord paid a tribute to the municipal engineer, who was among the most solitary of the profession. His compensation is seldom adequate, his tenure of office short and uncertain, his dealings being principally with men not of his own profession. He wished a way could be found to interest municipal engineers generally in the Western Society so they would come in. Less than one-fourth of the engineers in the employ of the city of Chicago are members of the Western Society of Engineers, although the society offers them pleasant, commodious quarters, a good reference library and opportunity to mingle with engineers representing many branches. Mr. Alvord was happy in his remarks and it is evident the new president will take rank with Mr. Allen, whose manner of conducting his office called forth much favorable comment during the year just completed.

Mr. Bernard E. Sunny, president of the Chicago Telephone Co., was the speaker of the evening and his address on "The Engineering of Chicago" was well received. This address will be printed in the Proceedings, and as it deals with Chicago conditions entirely is omitted here. Mr. Sunny criticised the municipality for working without an engineering plan. He instanced private corporations with their plans prepared by competent engineers looking to a definite development many years in the future, and contrasted it with the city working from day to day through departments not coordinated and having to do over again many kinds of work. A recommendation was made for a commission of engineers to prepare plans for all work with an insight into the future.

Councilman B. W. Snow, chairman of the council finance committee, seemed to resent the point of view of the engineers present, who glorified their profession, and showed how men who engineered a city budget through an insurgent city council might really be as smart as the engineers whom he was addressing. He recognized the fact that there are "engineers and engineers," likewise all politicians were not alike, and he calls himself a politician. Mr. Snow discussed the growth of Chicago from the standpoint of the man charged with the apportionment of inadequate taxes.

Mr. L. C. Fritch, chief engineer of the Chicago Great Western Ry., spoke of railway terminal facilities in great cities and especially in Chicago. He believed that with proper cooperation among the roads a good system of terminal yards could be arranged and then the electrical operation of railroads within the city limits would follow.

Colonel Milton J. Foreman, chairman of the transportation committee of the Chicago city

council, spoke vigorously on the necessity for consolidating the various taxing bodies in Chicago. The sanitary district, parks and boulevards received almost 75 per cent of the taxes raised, while the strictly municipal needs, such as the departments of streets, sewers, water works and health department, had to worry along with the rest. If he had his choice he preferred clean garbage cans to parks and preferred paved alleys to boulevards. As for engineering plans he thought them not always good because no one could tell what would happen in a certain district. Dissatisfaction with the plans and work of men gone before was evidence of growth. The only perfectly ordered, quiet, peaceful place he knew was a cemetery and it was the last place he cared to enter. He believed in competent men handling things, but not being bound by inflexible plans. He would rather see good men with plenty of money to meet conditions as they arose, something not now possible in Chicago.

Mr. Bion J. Arnold received an invitation to another banquet the same night, to speed Mr. Calhoun on his voyage to China. He chose to come to the Western Society, where, being among friends, the loss of his trunk on a trip ended that day cut no figure. Mr. Arnold discussed points brought out by other speakers on the local transportation question, deploring the lack of cooperation between the street car companies and giving reasons why consolidation into one large company would be good.

Mr. L. P. Morehouse, secretary of the Western Society of Engineers from June, 1869, to January, 1888, then addressed the gathering, to show, as he said, that the society had a past, and he was present at the fortieth banquet to prove there had been a first.. He paid a tribute to the late Mr. E. S. Chesbrough, former president of the society and for many years city engineer of Chicago, who had designed and built the present sewer system over 40 years ago.

Prize Designs for Concrete Houses.—A competition for designs for a concrete house and garage has been inaugurated by the Pittsburg Architectural Club through the liberality of the Universal Portland Cement Co., of Pittsburg, Pa. There will be six prizes of the following amounts: First prize, $250; second prize, $100; third prize, $50; fourth prize, $50; fifth prize, $25, and sixth prize, $25. The competition is open to every one. Full conditions of the competition can be secured by writing the Pittsburg Architecural Club, Pittsburg, Pa.

The Reinforced Concrete Girder Bridge at Florence, Arizona.

The bridge to be erected over the Gila River near the town of Florence, Pinal County, Arizona, is of the girder type with piers and abutments supported on concrete piles. The total length, c. to c. of end piles, is 700 ft., there being 14 spans each 50 ft. long. The plans provide for the use of 60 piles 18 ins. in diameter driven to the surface of a cemented gravel formation believed to be about 25 ft. below the bed of the river. Under each pier the piles are spaced 5 ft. 6 ins. c. to c. and capped with a concrete block 41 ins. wide by 38 ins. deep. The piles are reinforced with

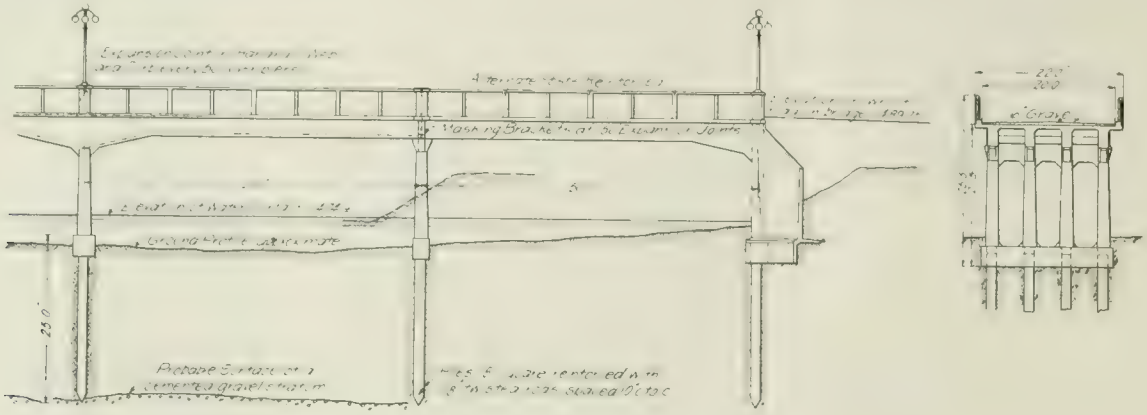

Fig. 1—General Elevation and Section of Concrete Girder Bridge.

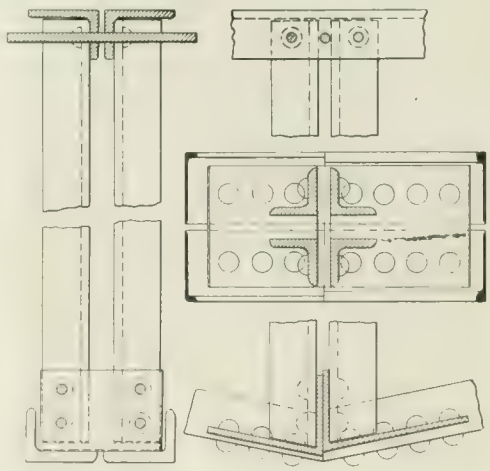

Fig. 2—Connection of Reinforcement Over Piers.

⅞ in. sq. bars in each corner with horizontal frames of ¼ in. square twisted bars 18 ins. apart around them. The concrete block on top serving as a sill for the pier posts, has a ⅞ ins. square bar near each corner with a frame of the same size bars around them set 14 ins. each way from the center line of the piles, there being 8 of these frames. The pier posts are 24 ins. square at the bottom and 18 ins. square at the top with same reinforcement as the piles, the length being about 14 ft. Figure 1. The over all width is 22 ft., the width between curbs being 20 ft., the curbs having a projection of 4 ins., thus giving a clear width of 20 ft. 8 ins. between hand rails. All concrete is 1:2:4.

Expansion joints are provided in handrail, web and curb every 50 ft., over piers, and in girders and slabs only at piers 1, 4, 7, 10 and 13, or 150 ft. apart, masking brackets being used at these points. Fig. 2 is a detail of the connection of girders over fixed piers. In Fig. 1 only two end spans are shown with location of expansion joint over pier.

The three next spans are connected, the end ones being supported cantilever girders, the middle one being fixed and with flat arch outline. The main girder is reinforced over the fixed piers with two 5x3½x⅝ in. angles in each girder. The bottom reinforcement in each main girder in fixed spans consists of two 5x3x⅜ in. angles and in each supported girder of two 5x3½x¾ in. angles. The reinforcement in each girder being of the unit type and independent, is connected over the fixed piers by rivetting as shown (Fig. 2), a method that will facilitate erection and simplify form work.

In Fig. 3 the main details are shown. On the right is shown the expansion joint. On top of each post is placed a bearing plate 1 in. thick, 16 ins. wide and 36 ins. long rivetted to two 5x3½x¾ in. angles 36 ins. long having four 14x¾ in. studs. On the bottom of each girder is a bent plate 1 in. thick and 16 ins. wide bolted to each bottom girder angle, as shown. To maintain a small bearing surface a 1 in. rod 16 ins. long is placed between the bottom angle and this plate. Only the alternate posts in the hand rail are reinforced, the reinforcement consisting of four ⅜ in. round rods spaced 6 ins. c. to c. The hand rail has at the top four ⅜ in. round rods spaced 2x6 in. c. to c. horizontally and 22 ins. below one horizontal square twisted ¼ in. bar. The vertical reinforcement for the panels consists of ¼ in. sq. twisted bars 9 ins. c. to c.

In the main girders the angles are kept in place in a very ingenious manner by separators consisting of ¾ in. round rods bent around them, with the ends turned in over the tops of the legs, the angles having their feet turned in. Wherever a rod or bar ends it is turned with a hook over the nearest intersecting bar or angle. The only rivetting is in the expansion joints and in the connections over fixed piers. The floor slab is 7 ins. thick, framed with beams 8x12 ins., 12 ft. 6 ins. c. to c. across the bridge carried by the four main girders. The slab reinforcement consists of ⅝ in. round rods spaced 7¾ ins. c. to c. across the bridge and ⅜ in. sq. twisted bars spaced 22 ins. c. to c. longitudinally with the bridge. The main girders are 16½ ins. wide by 32 ins. deep below the slab in the middle of each span. There are 30 drains of 3 in. diam. galvanized pipe in the floor slab with screens, the

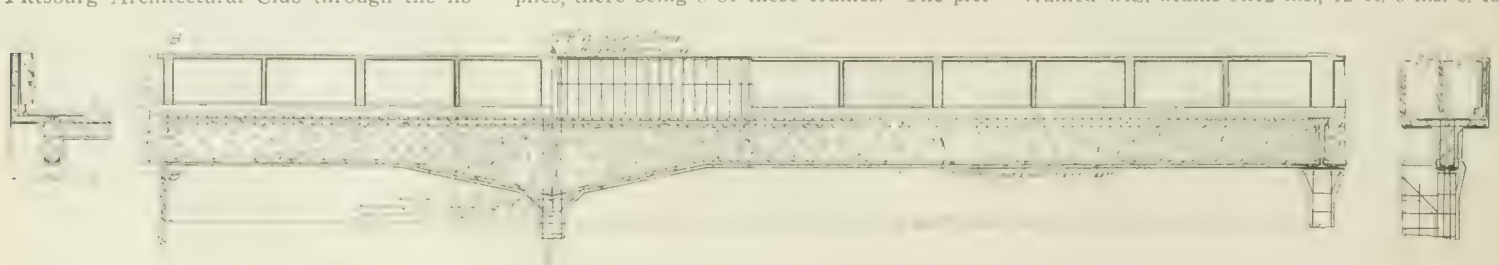

Fig. 3—Longitudinal Section of Concrete Girder Showing Reinforcement.

lower end being 1 in. below the bottom of the slab.

Particular interest attaches to the abutment and wing walls, the sections being very thin. The section on the right in Fig. 4 is on the center line of the bridge. The short section on the left is that through the wing wall and the high section is that through the junction of the abutment and wing wall.

The material in the river bottom to hard pan is sand and silt with considerable gravel and some stones up to one man size. The footings of reinforced concrete piles capped with a concrete block seems to be an efficient and economical foundation. The structure, from a study of the complete detail drawings, is an example of good design. Medium steel is specified throughout. The plans were prepared in the office of Mr. J. B. Girand, C. E. Territorial Engineer, Mr. R. R. Ryan, C. E., Designing Engineer, Tucson, Arizona.

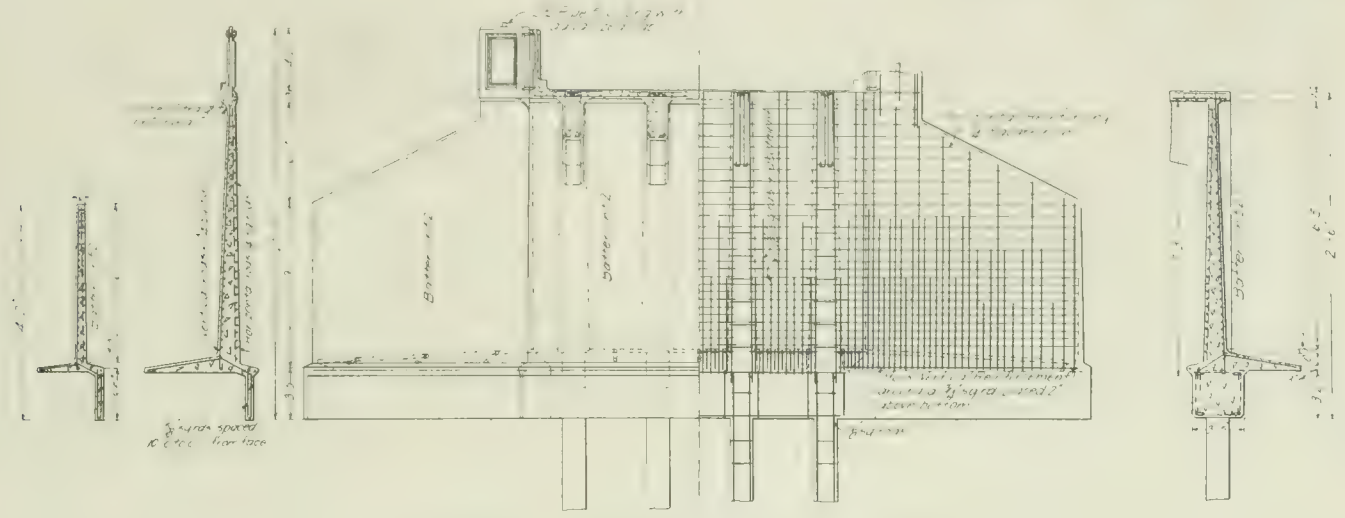

Fig.4—Details of Reinforced Concrete Abutment.

According to information sent out by the Pennsylvania Co., 673 grade crossings have been removed on the lines of this company east of Pittsburg and Erie. This includes only work completed up to Sept. 1, 1909, and does not include the ten crossings to be eliminated by the projected change of the line through Bristol, Pa., on the New York division. On the lines between New York and Washington, Philadelphia and Pittsburg, 256 public grade crossings and 129 private crossings at grade have been removed in the past ten years, leaving only 774 public crossings scattered over 574 miles of road. On the division between Philadelphia and Washington alone, 106 grade crossings have been eliminated; between Jersey City and Philadelphia, 78 crossings have been removed; and, on the Pittsburg division, 46 crossings have been taken out.

In 1906 we were unable to supply our customers with water pumping from two wells almost incessantly. In January, 1907, we installed a meter system. We are now pumping from one well only and using from this well shorter hours than when we ran both wells. It is obvious from this that our expense of pumpage is greatly reduced, thus making a big saving upon fuel, labor, machinery and the superintendent's time. Our customers have a better service and are better pleased, although in a number of cases the water tax has increased. The water plant is now on a paying basis. The fire protection is better, having more water and a greater pressure at all times.—Report of Andalusia Light & Water Co., J. H. Morgan, Mgr.

The new main line railroad track built in the United States in 1909 amounted to 3,748 miles, according to the "Railroad Age Gazette." In 1908, 3,214 miles were laid. These figures do not include additional tracks on the same road bed or sidings.

LETTERS TO THE EDITOR.

Articles on Concrete Lined Shafts.

Sirs:—I want to get some information on concrete lined shafts. H. J. S.

Chicago, January 8, 1910.

(Articles on the construction of concrete lined shafts and the lining of shafts with concrete have appeared in the *Contractor*, Sept. 18, 1908; *Engineering News*, Sept. 24, 1908, April 8, 1909; ENGINEERING-CONTRACTING, Nov. 11, 1908; *Engineering and Mining Journal*, Aug. 21, 1909. These references are taken from the "Monthly Review Index" published each month by ENGINEERING-CONTRACTING as a part of its regular issue for the second week of the month, and they show one of the valuable uses of the "Index" to engineers. By keeping a file of the indexes, or, better, by cutting out the items and pasting them on library index cards, the owner can in a comparatively short time find reference to articles on almost any subject relating to civil engineering work. The items as printed in the index are backed with advertising matter, so that they may be cut out and pasted without destroying any other items.—Editors.)

A Design for a Stadia Rod.

Sirs: I send a design for a stadia rod which I think is an improvement on the one shown in your issue of Jan. 5, 1910. The tenths of feet

Design for a Stadia Rod.

are not numbered, but twenty-five, fifty, and seventy-five hundredths of each foot are readily found as is shown by the design. This eliminates all error and confusion due to two sizes of figures. This rod can be seen as far as the large figures can be distinguished and is not very likely to be read while in an inverted position.

Yours truly,
JOSEPH M. PERKINS.

204 Lincoln Avenue, Valparaiso, Ind., Jan. 11, 1910.

Cost of Hand-Sweeping of Streets.

Sirs: I notice in the last issue of Engineering-Contracting a request for information as to the cost of hand-sweeping. We do considerable hand-sweeping in this city and find that the price varies from $1.40 to $1.70 per 1,000 sq. yds.

Respectfully,
JAS. C. TRAVILLA,
Street Commissioner.

St. Louis, Mo., Jan. 8, 1910.

A Bag of Cement Is One Cubic Foot of Cement.

Sirs:—I note in your issue of Dec. 22, 1909, an article on the subject of "A Bag of Cement is One Cubic Foot of Cement," with the idea of using this as a unit for measuring. I think you will find this whole subject covered very thoroughly in an article I wrote a year or two ago on the subject of "Selection and Proportion of Aggregates." This is a subject which should be given wide publicity as the barrel unit measurement is entirely obsolete and the measurement of barrels vary considerably. This whole subject has previously been approached from an entirely wrong standpoint. It is the amount of wet paste which will entirely coat each grain of sand and fill the voids between each grain of sand that should be specified and then the resulting mortar should a little more than fill in the crushed stone or gravel. If this point of view is taken it can be readily seen that arbitrary specifications of 1 : 2 : 4; 1 : 2½ : 5 and 1 : 2 : 6 are meaningless, maximum density being the object to be accomplished.

Very truly yours,
ALBERT MOYER.

New York, N. Y., Dec. 28, 1909.

(The paper referred to by our correspondent is reprinted in another column and we have also discussed it editorially.—Editors.)

On January 5, after a long debate, the Mann bill providing for a change in the government of the Panama Canal Zone, was passed by the House of Representatives. The vote was 119 to 102. The bill provides for the abolition of the Isthmian Canal Commission and the appointment of a director-general of the Canal Zone, who shall have entire supervision. This was favored in order that the authority might be centralized. The bill also makes provision for a Supreme Court in the zone, and gives the right of appeal to the Supreme Court of the United States.

The Board of Water Supply of New York City has awarded the contract for constructing the Kensico Dam and appurtenant works, in connection with the New Catskill water supply, to Rodgers & Hagerty, New York City. The contract price was $7,953,050, and the work includes 900,000 cu. yds. Cyclopean masonry, 37,500 cu. yds. mass concrete, and 1,330,000 cu. yds. of excavation.

(Continued from page 56.)

FRIDAY, FEBRUARY 25, 1910.

9 o'clock a. m.:

33. Meeting of Section on Art and Architecture.

34. Meeting of Section on Exterior Treatment of Concrete Surfaces. Topical discussion on the artistic treatment of concrete surfaces of various kinds.

35. Meeting of the Section on Machinery and Appliances.

10:30 o'clock a. m.:

36. Cost and Advantages of Concrete Drain Tile. J. H. Libberton, Assistant Inspecting Engineer, Universal Portland Cement Company, Chicago, Ill.

37. Installation and Operation of a Steam Curing Plant. F. S. Phipps, Manager, Central Stone Company, St. Joseph, Mo.

38. The Preparation of Concrete—From Selection of Materials to Final Deposition. Harry F. Porter, Consulting Engineer, Bridgeport, Conn.

8 o'clock p. m.:

39. Reinforced Concrete Columns. Robert A. Cummings, Pittsburg, Pa.

40. Reinforced Concrete Columns. Peter Gillespie, Lecturer, University of Toronto.

41. Use of Concrete in Protecting Wooden Pile against Teredo. Ralph Barker, Assistant State Engineer, San Francisco, Cal.

The requirements for membership in the association are simple; every concrete worker and civil engineer being eligible, provided 2 members of the association recommend the applicant. The annual dues are five dollars and each member receives free a copy of the transactions, containing all papers in full together with the discussions. The proceedings of the Fifth Annual Convention made a volume of over 600 pages, 6 by 9 ins. with many illustrations. All communications should be addressed to National Association of Cement Users, Harrison Building, Philadelphia, Pa.

Technical Society Meetings.

The list following names those technical societies in which engineers and contractors are most interested, whose meetings are to be held within three months of the date of this issue. There are given for each society listed the date and place of meeting and the name and address of the secretary, to whom all communications and inquiries should be addressed.

American Society of Civil Engineers.
Jan. 19-20, 1910. Annual meeting at New York City. Secy., Chas. Warren Hunt, 220 W. 57th St., New York, N. Y.

Canadian Society of Civil Engineers.
Jan. 25-27, 1910. Annual meeting at Ottawa, Ont. Secy., C. H. McLeod, 413 Dorchester St., West, Montreal, Que.

American Society of Engineering Contractors.
Feb. 24-26, 1910. Annual convention at Chicago, Ill. Secy., Daniel J. Hauer, Park Row Building, New York, N. Y.

American Society of Heating and Ventilating Engineers.
Jan. 18-20, 1910. Annual meeting at New York City. Secy., W. M. Mackay, P. O. Box 1818, New York, N. Y.

American Society of Inspectors of Plumbing and Sanitary Engineers.
Jan. 20-22, 1910. Annual convention at Trenton, N. J. Secy., C. S. McCosker, Mobile, Ala.

Connecticut Society of Civil Engineers.
Feb. 8, 1910. Annual meeting at New Haven, Conn. Secy., J. Frederick Jackson, Box 1304, New Haven, Conn.

Illinois Association of Municipal Contractors.
Feb. 24-26. Annual meeting at Chicago, Ill. Secy., Orie T. Dunlap, Edwardsville, Ill.

Illinois Lumber Dealers' Association.
Feb. 16-18. Annual meeting at Chicago, Ill. Secy., Geo. K. Hotchkiss, 315 Dearborn St., Chicago.

Illinois Masons' Supply Association.
Feb. 16-18. Annual meeting at Chicago, Ill. Secy., Geo. K. Hotchkiss, 315 Dearborn St., Chicago.

Illinois Society of Engineers and Surveyors.
Jan. 26-28, 1910. Annual meeting at Cairo, Ill. Secy., E. E. R. Tratman, 1636 Monadnock Block, Chicago, Ill.

Indiana Engineering Society.
Jan. 14-16, 1910. Annual convention at Indianapolis, Ind. Secy., Chas. Brossman, Union Trust Bldg., Indianapolis, Ind.

Interstate Mantle and Tile Dealers' Association.
Feb. 15-19. Annual meeting at Chicago, Ill. Pres., Joseph W. Lantry, Wm. H. Jackson Co., Union Square, New York City.

Iowa Association of Cement Users.
March 9-11, 1910. Annual meeting in Cedar Rapids, Ia. Secy., Ira A. Williams, Iowa State College, Ames, Iowa.

Iowa Engineering Society.
Feb. 16-17, 1910. Annual convention at Cedar Rapids, Ia. Secy., A. H. Ford, Iowa City, Ia.

Michigan Engineering Society.
Jan. 12-14, 1910. Annual meeting at Lansing, Mich. Secy., Alba L. Holmes, 574 Wealthy Ave., Grand Rapids, Mich.

National Association of Cement Users.
Feb. 21-25, 1910. Annual meeting at Chicago, Ill. Secy., Geo. C. Wright. Address all communications to Edw. E. Krause, Asst. to the President, Harrison Bldg., Philadelphia, Pa.

National Brick Manufacturers' Association.
Feb. 7-12, 1910. Annual convention at Pittsburg, Pa. Secy., T. A. Randall, Indianapolis, Ind.

Ohio Engineering Society.
Feb. 8-10. Annual meeting at Columbus, Ohio. Secy., C. J. Knisley, New Philadelphia, O.

Northwestern Cement Products Association.
Feb. 18-21, 1910. Annual meeting at Chicago, Ill. Chairman of Executive Committee, O. U. Miracle, Minneapolis, Minn.

Western Drainage Contractors' Association.
Feb. 17, 1910. Fort, Dodge, Ia. Secy., S. F. Moeller, Knierim, Ia.

Notes from Technical Societies.

The Ohio Engineering Society announces that the date of the annual meeting has been changed from Feby. 15-16-17 to Feb. 8-9-10, at Columbus, Ohio.

A new society, The Western Drainage Contractors' Association, has been organized. The first regular meeting will be held in Fort Dodge, Iowa, on Feby. 17.

The Northwestern Cement Products Association will hold the sixth annual convention in Chicago, Feby., 18-19-20-21 at the time of the Cement Show. This change from the plan to hold the convention in St. Paul was caused by the serious illness of President Martin T. Roche and the resignation of Secretary Pfiffner whose employers transferred him to far western territory. President Roche is improving rapidly and intends taking a long rest from business.

Personals.

Mr. John M. Hackett has been elected City Engineer of Dunkirk, N. Y., to succeed Mr. J. P. Morrissey.

Dr. E. J. Laclede of the firm of Laclede & Provost, Sanitary and Hydraulic Engineers, has been appointed Commissioner of Health of New York city.

Mr. A. J. Hammond has resigned his position of City Engineer of South Bend, Ind., to go into private practice as a Civil and Hydraulic Engineer with offices in the same city.

Mr. C. J. Jeppeson has opened an office as Consulting Engineer at 118 East 28th St., New York city. Mr. Jeppeson has been for a number of years Chief Engineer of J. B. & J. M. Cornell, Structural Steel Contractors, New York city.

Mr. Ralf R. Newman has been appointed Engineer and Manager of the Concrete Bureau, Boston, Mass. Mr. Newman is a graduate of the Massachusetts Institute of Technology and has had experience in concrete work with French & Hubbard, Boston, Mass., Mr. E. L. Ransome, New York, the Kern River Co. and the San Joaquin Light & Power Co.

Mr. T. J. Wyche has been appointed Chief Engineer of the Western Pacific R. R. to succeed Mr. Virgil A. Bogue, who has resigned the position to resume private practice with offices in New York city. Mr. Wyche is regarded as one of the best Railroad Engineers of the west, and he has had a wide experience in railroad construction in the intermountain country. As Construction Engineer for the Union Pacific Mr. Wyche practically rebuilt the road between Laramie and Ogden and several million dollars were expended by the Harriman lines under his direction. Mr. Wyche's work on the Western Pacific has been of unusual quality and he has been regarded as the logical successor to Mr. Bogue since his announcement that he would return to New York when the Western Pacific was turned over to the operating department.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

The Insulation of Pipes and Boilers.—Paper, 3½x6 ins., 24 pp. H. W. Johns-Manville Co., 100 William St., New York, N. Y.

This is a booklet describing pipe coverings, with recommendations for particular uses of the several sorts mentioned.

Steam Road Rollers.—Paper, 8x10½ ins., 38 pp. The Kelly-Springfield Road Roller Co., Springfield, Ohio.

This is a complete catalog of the well known Kelly-Springfield Road Roller. With it is sent a smaller booklet entitled "The Why of the Kelly-Springfield Road Roller."

Hydraulic Stone Machinery.—Paper, 9x12 ins., 44 pp. Fisher Hydraulic Stone and Machinery Co., Baltimore, Md.

Describes machinery for making concrete building blocks by the "wet process," using hydraulic pressure instead of hand tamping to compact the mass in the molds.

Mine Locomotives.—Paper, 8x10 ins., 68 pp. The Jeffrey Manufacturing Co., Columbus, Ohio.

This is Bulletin No. 17, and while mainly descriptive of electric locomotives used in mines, also illustrates electric industrial locomotives used in lumber yards around industrial plants and for contractors' use.

Contractors' Portable Saw Rigs.—C. H. & E. Manufacturing Co., Inc., Milwaukee, Wis.

This circular illustrates a portable circular saw outfit for contractors, equipped with gasoline engine.

Road Making Machinery.—Paper, 3½x6 ins., 24 pp. The Good Roads Machinery Co., Kennett Square, Pa.

This pamphlet illustrates all the machines used by road builders from plows to rollers and crushing plants.

Progress on New York State Barge Canal.—State Engineer F. M. Williams reports that there have been excavated on the new and enlarged Erie canal more than 25,000,000 cubic yards of material, and over 2,500,000 cubic yards of embankment have been built. There have been laid more than 500,000 yards of concrete. The total value of the work completed since the beginning is $15,800,000, and it is estimated that during the year 1910 work will be completed amounting to $16,000,000. The building of this canal has called into use every type of machinery employed in works of construction, and it is estimated that there is at present invested in operating plant about $7,600,000. By April 1 next it is expected that the work for the entire length of the canal will be under contract, and it is not unreasonable to expect that at the present rate of progress the entire canal will be completed by the end of 1914. The work is being carried on within the original estimates, and present calculations give assurances that all the construction contemplated by the law of 1903 will be completed within the original appropriation of $101,000,000. The act provides for the construction of a canal having a minimum bottom width of 75 ft. and a minimum depth of 12 ft. in land line. The locks are designed for boats of 2,000 tons capacity; there will be 53, ranging in lift from 10 ft. to 40½ ft., this latter lift occurring at Little Falls. Fifteen of the large locks are now completed, with the exception of gates and operating machinery, and three of these locks will be used as a part of the state canal system on the opening of navigation next spring. When completed, the barge canal locks, with their immediate approach walls will have cost approximately $16,000,000. There will be 22 fixed dams and 14 movable dams. Of the latter seven are now under construction, two of them nearly completed. By one year from next spring the eight movable dams in the Mohawk river will be in operation and will be used to aid in the dredging of the channel, by retaining water for the floating of the dredging machinery.

Contract News Section

ENGINEERING-CONTRACTING

A Consolidation of Engineering-Contracting—Contract News—Engineering World—The Dirt Mover.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

James McGraw & Co., Philadelphia, Pa., has been awarded the contract for the changing the present4-track through Bristol, Pa. The work which will eliminate 10 grade crossings and an undesirable curve, includes the construction of 10 bridges and the construction of a 4-track line one and one-half miles long.—W. P. Tierney & Co., Nelson, B. C., has been awarded the contract for the construction of the Canadian Pacific 15-mile spur from Hartford Junction, B. C., to the Wellington Camp.—C. F. King & Co., Land Title Bldg., Philadelphia, Pa., has been awarded the contract for grading and masonry work on the Philadelphia & Reading Ry., between Perkiomen Junction and Phoenixville, Pa., a distance of 1½ miles.—The Galveston-Houston Electric Ry. Co., Houston, Tex., has mortgaged its holdings in Texas to the City Trust Co., Boston, Mass., for $5,000,000, and proposes the immediate construction of its proposed line between Galveston, Tex., and Houston.—The Union Pacific Ry. Co., A. L. Mohler, Omaha, Neb., vice president and general manager, has filed survey plats at Cheyenne, Wyo., for the construction of a cutoff from the Northport, Neb., branch to a junction with the main line at Medicine Bow, Wyo., shortening the line from Medicine Bow, Wyo., to Chappell, Neb., 40 miles and reducing the grade. The work includes some heavy tunnelling.—The Denver & Rio Grande R. R. has decided to broad gage its Third Division from Gunnison, Colo., to Crested Butte and ultimately to Montrose.—Ninty miles of track on the San Pedro, Los Angeles & Salt Lake R. R. have been washed out, causing a loss of approximately $14,000,000. Steps are being taken toward the immediate reconstruction of the line.—Plans and specifications have been prepared by the engineers of the Escondido Electric Railway Co., for the construction of the proposed line, which includes a 2,600 ft. tunnel through Scripps' Summitt, and bids for the work are to be asked at once.—Plans and specifications have been prepared by the Municipal Board of Commissioner, of Dallas, Tex., for the construction of the proposed dam at the White Rock Reservoir site. The proposed dam will be 2,100 ft. long, 211 ft. wide at the base, 16 ft. wide at the top and 42 ft. high The work is estimated to cost $750,000. Bids for the work are to be asked at once.

A Mine of Dredge Buckets.

Our friends in the dredging line can be got at times to relate queer experiences of unexpected materials encountered in their delvings into the bottoms of harbors and things, but the report coming from Panama of one dredge man having located a mine of dredge buckets is in a class by itself. As the story is told this dredge man had been ordered to take up a new position in the Rio Grand near Corozal, and had obeyed orders with no more comment than moving a dredge in a hot climate naturally engenders. "She" had hardly begun to bite well, however, when with a snort and a wrench a fairly well preserved dredge bucket was lifted and dropped with a splash into the hoppers. This was followed by a second and a third and others in rapid succession until just when the operator had decided to throw up his job and get a contract to mine dredge buckets for the Canal Commission the pay streak petered out. A count of the day's work showed 55 buckets mined in 8 hours. No more buckets were discovered and the dredge man has given up the idea of developing a mine, but he still claims the greatest output per day of dredge buckets in a regular run of any man in the business and defies anyone, gringo or white man, to show that he is wrong.

The Respect Due to Contractors.

A number of contractors' organizations have come into existence within the past two years, chief among them being of course the American Society of Engineering Contractors.

Just what is an engineering contractor? In the minds of some men a comparison is made with the old style gentleman farmer who knew how to farm by the book; the engineering contractor being thought of as a contracting engineer too high toned to be called a contractor. A man who knows by the book and who prefers fine clothes to overalls. The definition of an engineering contractor is really so simple as to be absurd when one has listened awhile to the conversation of some men who do not like the name.

An engineering-contractor is a contractor able to handle engineering contracts in a satisfactory manner. The house builder whose largest job is an ordinary three or four story building is a building contractor. When he counts the four story brick as beneath his notice, except as one of a large group, and takes contracts for large steel frame or reinforced concrete structures he becomes an engineering contractor. The man who puts in small culverts may be a mason contractor or a tile layer, but let him start out to erect good size country and other bridges and he is an engineering contractor. The concrete sidewalk builder is not an engineering contractor until he makes a specialty of contracts involving engineering problems and drops his sidewalk work except as a side issue.

The engineering contractor, it is easy to see, is not necessarily trained as an engineer in a technical school, so is not a "high brow" masquerading as a contractor. He may never have seen the inside of an algebra and is vastly more interested in the X on a greenback than in an equation. The equation of payments, taught in a common school arithmetic, is about the only thing in the shape of, or bearing the name of, an equation that many engineering contractors understood in mathematics. The fact is that present day contractors are handling propositions involving important problems capable of solution only by methods patterned upon the methods of engineers. That a large number of the most successful contractors have been educated as engineers, shows the training of the engineer is in many ways a desirable one for men engaged in the calling of the contractor.

Some day schools will establish courses prepared for men who intend taking up construction work as contractors or contractor's superintendents. They will not be engineering courses nor tacked on to engineering courses, although attempts will be first made along those lines, but will be courses of study prepared expressly for the purpose of shortening the term of pupilage on work all contractors now serve.

It will be some time yet before the school-trained contractor becomes a fact. In the meantime an engineering training may be useful but it is not essential, for the engineering contractor is not always a contracting engineer but is merely a contractor confining his operations to large jobs where system and scientific methods must be employed. He is on a plane with other business men handling large interests and is treated with more respect than contractors have heretofore been accustomed to.

In Illinois the Association of Municipal Contractors had the courage to send a letter to the Boards of Local Improvements throughout the state giving advice on certain business matters. This communication was treated with consideration nearly everywhere it went. Imagine the reception such a letter would have received a few years ago before contracting was regarded as a real business. In New York the General Contractors' Association drew up a list of objections to clauses in contracts and specifications and the powers that be sent a request to the Association to present a brief in order that proceedings may be simplified. This marks only a beginning and shows that from the moment the engineering contractor drew away from the crowd and assumed an identity, he was accorded the respect that every legitimate business man deserves.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ILLINOIS.

The Northwestern Engineering & Construction Co., Majestic Bldg., Milwaukee, Wis., have been awarded the contract for the construction of an electric railroad from Sterling to Rock Island, Ill. Preliminary surveys have already been made for the line which will be 62 miles in length. The company expects to be in the market for tools, equipment, supplies, etc., and also may consider subletting some of the work. Nothing definite has yet been decided. J. J. Dunket is Secretary of the company.

The East St. Louis, Columbia & Waterloo Ry. Co. has surveys completed for the construction of the proposed line from East St. Louis, Ill., to Waterloo, Ia., a distance of 23 miles. The route as projected will pass through Dupo, Bixby, Columbia, Ill. Contracts for the work are to be let in the spring of 1910. Baxter Brown, 610 Laclede Bldg., St. Louis, Mo., is Chief Engineer of the company and H. Reichenbach, Columbia, Ill., is Secretary.

INDIANA

The Beench Grove Traction Co., recently incorporated in Indiana for the purpose of building an electric line from Indianapolis to Beach Grove and to build and operate power plants, has completed surveys and secured capital for the construction of 4 miles of line. No contracts are to be let for the work. C. N. Cottingham, Indianapolis, Ind., is Chief Engineer of the company. W. H. Ogan is one of the Directors of the company.

IOWA.

The Waterloo, Cedar Falls & Northern Ry. Co., has completed surveys for the construction of the projected 6 mile line from Denver, Ia., to Waverly in Bremer County, Ia. Capital for the work has been secured and contracts will be let about March 1, for the construction, which will be mostly steam shovel work. L. S. Cass, Waterloo, Ia., is President, and T. E. Rust, Waterloo, Ia., is Chief Engineer of the company.

Current reports stating that the Waterloo, Cedar Falls & Northern Ry. Co., of Waterloo, Ia., was planning to build an electric railway to connect Mason City, Waterloo and Fort Dodge, Ia., are unfounded. L. S. Cass is President of the company.

KANSAS.

Surveys are under way for the proposed lines of the Kansas Union Traction Co., by Archer, Rollins & Co., Kansas City, Mo. As projected one line will be from Parson to Coffeyville, Kan., and the other from Cherryvale to Columbus, Kan., a total distance of 90 miles. William J. Jones, Altamont, Kan., is the President of the company and Barney McDaniel is Secretary.

The Kansas Northwestern R. R. Co., which projects a 300-mile line from the northern border of the state to Wichita, Kan., is desirous of figuring with some strong contracting firm able to place a part of the company's securities. O. W. Dawson, Great Bend, Kan., is Secretary of the company.

KENTUCKY.

O. G. Peterson, President, Associated Engineering Co., Lincoln Bank Bldg., Louisville, Ky., would like to get in touch with a contractor with about 20 teams to do the hauling of the material for concrete work. The work includes the hauling of 15,000 yds. of stone, sand and cement from one to three miles and is located at Crofton, Ky. The job would be finished by April, leaving the contractor free to enter other work.

LOUISIANA.

Reports to the effect that the Lake Charles Railway & Water Works Co., Lake Charles, La., is planning the construction of an electric railway from Edna to Kinder, La., a distance of 6½ miles, are incorrect, as no such work is under consideration. P. O. Moss, Lake Charles, La., is Secretary.

MICHIGAN.

Preliminary surveys have been completed and right of way secured for the proposed extension of the Kewanee Central Ry., from Mandan, Mich., to Fish Cove Bay. Capital for the work has not yet been obtained but it is expected that all preliminaries will be arranged and contract let in the spring. F. E. Simar, Hancock, Mich., is chief engineer.

MISSISSIPPI.

The Mississippi River Western Construction Co. denies the report that the contract was awarded them for the construction of a 193 miles of line for the Mississippi River Western R. R. This work was recently mentioned in ENGINEERING-CONTRACTING. A. H. Longino, Jackson, Miss., is president of the Construction Company.

MISSOURI.

The St. Louis, Bartlesville & Pacific Ry. has completed surveys and partly secured right of way for the proposed line from Joplin, Mo., to Carmen, Okla., a distance of about 220 miles. D. H. Rhoades, West Fourth St., Joplin, Mo., is chief engineer.

NEW YORK.

MacCracken-Hauer-Terry Co., has about 25 miles of very heavy earth and rock work on the Delaware & Eastern R. R., in New York state. The work is being sublet from the offices of the company at Gilboa, N. Y. Daniel J. Hauer is one of the company.

The Elizabethtown Terminal R. R. Co., Elizabethtown, N. Y., through Vincent R. Coon, its general contractor and manager, will receive bids at once for the construction of a steam railroad from Westport to Elizabethtown, Essex County, N. Y., a distance of eight miles. The work will be mostly scraper and shovel work.

OKLAHOMA.

The Beaver Valley & Northwestern Ry. Co. has completed surveys for the construction of the projected line from Gage, Okla., to Hooker, Okla. Capital for the construction work has been partly secured, but no definite date has as yet been decided for letting the contracts. J. W. Webb, Beaver City, Okla., is President of the company and C. H. Holmes, Gage, Okla., is Secretary.

The Clinton & Oklahoma Western Ry. Co. has completed surveys for the entire system, including 568 miles projected from Lehigh, Okla., via Clinton, Okla., to Trinidad, Colo. Frank L. Adams & Co., Contractors, Oklahoma City, Okla., who have the contract for the construction of 75 miles of line, has 25 miles of the work completed. Guy V. McClure, Oklahoma City, Okla., is Chief Engineer of the company, and T. J. Nance, Clinton, Okla., is President of the company.

OREGON.

D. Fitzgerald, Pentleton, Ore., has the general contract for the construction of a 52-mile interurban railway from Athena to Hermiston, with general offices and shops at Pendleton, Ore., and also for the development of a 6,000 h.p. water power on the Walla Walla River for electrical purposes. The work includes 26,000 cu. yds. of earth excavation, 7,000 cu. yds. of rock excavation, 9,000 cu. yds. of embankment, 3 bridges 230 ft. long, one steel and two wooden with concrete piers, 600 ft. of pile trestling 22 ft. high, 1,200 cu. yds. of masonry, 200 cu. yds. of stone masonry. All of the work is to be sublet. The contractor is in the market for ties, poles, piling, bridge timbers, trailing cars, hydraulic machinery, 12 miles of galvanized iron or steel or 48-in. wood pipe and 30 miles of transmission equipment.

TEXAS.

S. M. Bush, Railroad and Levee Contractor of Memphis, Tenn., has work under way on his contract on the Santa Fe cut-off from Coleman to Texico, Tex., and expects to finish all the heavy work by April 1. The work includes 16 miles of the proposed line and 1,200,000 cu. yds. of material, a good part of which is rock work. Bush has an office at Roscoe, Tex.

The Gulf, Colorado & Santa Fe R. R. has completed surveys for the construction of the projected 60-mile line from Lometa to Brady, Tex. Capital for the construction has also been secured and contract will be let for the work January 31, 1910. E. P. Ripley, Chicago, Ill., is President of the company and F. Merritt, Galveston, Tex., is Chief Engineer.

The Grigsby Construction Co., Dallas, Tex., has been awarded the contract for the construction of the proposed 30 mile line of the Southwestern Ry. Co. southwest of Henrietta, Tex., through Archer City. Surveys for the work have all been completed. M. B. Mobberly, Henrietta, Tex., is Chief Engineer of the company, Henry J. Scott, Toronto, Ont., is President and A. C. Parks, Henrietta, Tex., is General Superintendent.

The Glen Rose & Walnut Springs Ry. Co. of Glen Rose, Tex., which has under construction a 14 mile line has completed 7 miles of the work. J. H. Farr is vice president and general manager; Thomas M. Simpson, Glen Rose, Tex., is engineer of the company.

The Beaumont Traction Co., Beaumont, Tex., has under contemplation considerable improvement to its property and is taking the matter up with the city. C. H. Kretz is general manager of the company.

The San Diego, El Paso & St. Louis Ry. has completed surveys for 200 miles of the proposed 500-mile line from El Paso, via Hope and Artesia, N. Mex., through the Pan Handle of Texas to the Red River. Negotiations are under way for securing capital for the construction of the line. A. Courchesne, El Paso, Tex., is president of the railroad and P. A. McCarthy & Sons, Houston, Tex., are the engineers. It is expected to let contracts for the construction work in the spring.

UTAH

The franchise granting the Salt Lake & Los Angeles Ry. Co. to double track and electrify its line to Saltair is before the city council of Salt Lake City, Utah. Nothing will be done toward the work until the franchise is granted. J. E. Langford, Jr., is Secretary of the company.

CANADA.

The Great Northern R. R. Co. has let contract for grading the line between Princeton and Tulameen, B. C., on the Vancouver, Victoria & Eastern and also between Abbotsford and Chillewack, B. C., a total distance of 37 miles to J. W. Stewart. A. H. Hogeland, St. Paul, Minn., is Chief Engineer of the company.

The Hamilton, Waterloo & Guelph Ry. Co. has had surveys made for the construction of three lines radiating from Hamilton, Ont., as follows: Hamilton to Waterloo; Hamilton to Guelph; Hamilton to Toronto, Ont., the latter being double tracked. The line comprises 140 miles. Capital for the construction of the above system has been party secured and it is expected to let contracts for the work

Over 40 years building Contractors' Tents, Tarpaulins and Canvas Goods of Every Kind

Stable Tent **30 x 49** 10 oz. army duck, roped on ridge, eaves, across bottom of gables and every seven feet over top with 6 foot detachable 10 oz. S. F. walls and poles for **$160.00** net. First-class in every respect. Other sizes and weights in same proportion. *Write for Catalogue.*

MORRISON TENT & AWNING CO., 115-117 OLIVE STREET ST. LOUIS, MO.

in the spring. Thomas E. Hillman is Chief Engineer of the company, Paul J. Myler, Hamilton, Ont., is President of the company and J. Patterson, Hamilton, Ont., is Secretary and General Manager.

The Southwestern Traction Co., London, Ont., which is considering the construction of an extension of its line from London to Ingersoll and from St. Thomas to Aylmer, Ont., has as yet decided nothing definite regarding the project. W. T. Coy.

Power Developments, Levees, Drainage and Irrigation Works.

COLORADO.

Reynolds & Covey, McPheel Bldg., Denver, Colo., have an irrigation district comprising 20,040 acres of land located in Arapahoe and Elbert counties, Colorado, within 25 or 35 miles from Denver. Bonds have all been voted and estimates are being made to submit to responsible contractors. The work will include the construction of three large reservoirs and 40 miles of ditch work. Lee A. Reynolds is a member of the company.

KANSAS.

Capt. William D. Davis, Constructing Quartermaster, Fort Leavenworth, Kan., has received bids for 84,000 cu. yds. of earth work. Joyce Bros. & Bogwell and M. A. Wogan, both of Kansas City, Mo., were the lowest bidders.

NEW YORK.

The Hodenpyle, Walbridge Co., 7 Wall St., New York, N. Y., have under development at the present time one dam on the Au Sable River, known as the Cooke Development, being about 14 miles from the mouth of the river. The work is being done with the company's own forces, no contracts being let for the construction. Bids for the major portion of the apparatus are in preparation. William Eaton.

WASHINGTON.

Residents of the Yakima, Wash., Valley have formed the Valley of the Yakima High Line Association which will secure competent engineers to make a preliminary survey for the extension of the Kittitas Canal, a distance of 200 miles, to bring water from the lakes in the Cascades to North Yakima, Wash., at an altitude of 2,000 ft., making it possible to reclaim all the bare ridges surrounding the city long considered worthless. The survey will be submitted to the Reclamation Service, and should the project prove feasible, the association is in hopes of inducing the government to take up the matter and continue with a permanent survey. Lee A. Johnson, Sunnyside, Wash., is President of the Association.

E. E. Ball, Winslow, Ariz., Division Engineer of the Atchison, Topeka & Santa Fe Ry. Coast Lines, is quoted as stating that contracts will be let at once for the construction of the double track from Flagstaff, to Ash Fork, Ariz. It is thought that the company considers the double tracking of the whole line to Los Angeles, Cal.

The Sanford & Everglades R. R. Co., operating 7 miles of line between Sanford, Fla., and Cameron, projects the construction of a 200 mile line south to Miami, a point on the Atlantic Coast. The route proposed by the company will be 20 miles inland from the Florida Coast line and will tap the richest virgin pine section in Florida. The syndicate controlling the railroad has also purchased 102 acres of land in Sanford, Fla., for the construction of terminals, including storage tracks, shops, passenger station, freight and ware houses and general offices.

The Seaboard Air Line Ry. Co. was authorized by the State Railroad Commission of Georgia, to issue $1,380,000 of equipment trust notes, in addition to the $7,000,000 already issued. The work will be used for the equipment and extension of the facilities of the road. L. R. Watt, Norfolk, Va., represented the company.

According to reports from Glascow, Ky., John F. Mallette, Philadelphia, Pa., is interested in the construction of the proposed Louisville, Lincoln Farm and Mammoth Cave Traction line, for which, Charles Vandenburgh, Glascow, Ky., was granted a franchise last fall.

Citizens of Ellsworth, Me., are taking steps to have the Maine Central R. R. construct a branch line from Ellsworth up the Union River valley touching the cities of Mariaville, Amherst, Aurora and Great Pond, thence across the country touching Alligator and Nicatous Lakes to Grand Lake and to connect with the St. Croix branch at Princeton. Morris McDonald, Portland, Me., Vice President and General Manager of the Maine Central, is reported to be considering the proposition.

Plans for the extension of the Boston, Mass., Elevated Ry. Co. to Malden, a suburb of the city, have been completed and are awaiting the approval of the commissioners.

Engineers of the New York, New Haven & Hartford R. R. are working on plans for the construction of a tunnel beneath Boston, Mass., to connect the two terminals stations. Plans are also under consideration, it is said, for the electrification of the suburban system. H. L. Ripley, New Haven, Conn., is Construction Engineer.

The Roswell, Northern & Gulf R. R. Co. has been incorporated with a capital stock of $150,000 and proposes the construction of a railroad from Roswell, N. H., 100 miles north to Tucumcari, N. M., where it will make connections with the Rock Island and El Paso & Southwestern Rys. The incorporators of the company are C. C. Tannelhill, Alvin R. Morrison, Philadelphia, Pa.; A. Pruit, James F. Hinkle, J. Phelps White, Clifton Chisholm, J. Smith Lea, Edgar L. Bedell and John W. Rhea. The company has other steps under contemplation.

The Illinois Central R. R. Co. is reported to be considering the construction of an extension of the Trail Lake branch to Belzon, Miss., thence on to Tchula. L. C. Fritch, Chicago, Ill., is Consulting Engineer.

A movement is under way toward extending the levee from Vicksburg, Miss., to Brunswick. The construction of this levee would make 100,000 acres of waste land in Washington County cultivatable. W. Thomas Rose, Vicksburg, Miss., is President of the Brunswick-Vicksburg Levee Board.

According to a statement reported to have been made by E. F. Frendenthal, Pioche, Nev., the Pioche & Calienthe R. R. Co. is planning the construction of a 7 mile extension around Pioche Mountain. Construction work will be started on the new line as soon as winter breaks up. The following important mining properties are located on the proposed extension: Prince, Golden Prince and Pioche King.

According to announcement made by C. B. Anderson, General Manager of the Gallatin Interurban Ry. Co., Bozeman, Mont., the company is considering the construction of an extension to its line in the direction of Three Forks.

Location surveys have been started for the construction of the double tracks on the Oregon Short line between Farmington and Ogden, Utah. Preliminary surveys for this work were completed some time ago. Actual construction work will not be started before August. William Ashton, Salt Lake City, Utah, is Chief Engineer of the railroad company.

Surveys are under way for the construction of the proposed Mono Lake & Tonopah R. R. The line will leave the Tonopah & Goldfield R. R. in the neighborhood of Coaldale, Nev., and tap the rich lumber section in Inyo County, Nev. F. T. Armistead, Tonopah, Nev., is Engineer M. W., of the Tonopah & Goldfield R. R.

Plans are being made for the construction of the proposed Hazen Center, New Salem Electric Line which projects the construction of a line from Hazen to New Salem, paralleling the north branch of the Northern Pacific Ry. The company is contemplating the installation of a large power house at Center, N. Dak., which will be the division point.

The Great Northern Ry. Co. has decided to construct the proposed cutoff in North Dakota. Ayr, Cass County, N. D., will be the eastern terminal and Surrey, Ward County, is the Western Terminal. J. C. Patterson, St. Paul, Minn., is Assistant Chief Engineer of the Great Northern Ry.

The Chicago, Milwaukee & St. Paul R. R. is reported to be taking steps toward the construction of the proposed line from Fargo, N. Dak., to Winnipeg, Manitoba. Active work will be started in the spring, it is expected. A. J. Earling, Chicago, Ill., is President of the C. M. & S. P. Ry.

According to reports from the vicinity of Charlotte, N. C., work is to be started in May on the construction of the proposed railroad from North Wilkesboro, N. C., to Butler, Tenn., a distance of 90 miles. The company which is known as the Watauga Railroad Co., has already spent $200,000 for rights-of-way. Frank A. Linney and Ed. Coffey of Western North Carolina are interested.

J. A. Mills, Raleigh, N. C., President and General Manager of the Raleigh & Southport Ry. Co., is quoted as stating that contracts have been let for the construction of an extension to its line to Elizabethtown, Bladen and beyond. The line is to be standard gage and is to be laid with 56-lb. rails.

The Jefferson Construction Co. of Shenandoah Junction, W. Va., was granted a charter at Charleston, to mine and deal in clay, iron, stone and manufacture same into useful products, operate pottery, drill for oil and gas and also to engage as general contractors and builders. The capital stock of the company is $5,000 and the incorporators are Nelson R. Roberts and James Grantham and Eugene Shugerr and Abram Kaplon, Harper's Ferry, and James H. Mason, Jr., of Charlestown.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

According to reports in circulation at Van Buren, Ark., the Fort Smith Light & Traction Co., is to take steps immediately toward extending its Electric Park Line to the Arkansas River opposite Van Buren.

Reports from Fort Smith, Ark., state that Chicago capitalists are promoting the construction of an electric interurban line from Oklahoma City, Okla., to Fort Smoth, Ark., and that surveys for the proposed lines are already under way.

The Fort Smith, Van Buren & Eastern Interurban Light & Traction Co. has been chartered to construct and operate by either steam or electricity a line from Van Bren, Ark., across Crawford County into Franklin, Johnson, Madison, Newton, Boone and Searcy counties. The company has an authorized capital of $100,000, $650 of which has been paid in. The incorporators are W. F. Keller, Sam R. Chew, W. F. Blocker, L. F. Sherwood, J. W. Keller, T. H. Kibbler, John Kibbler, J. H. Keller, L. W. Burgett, S. A. Pernot, T. A. Bayley, J. L. Rea and F. T. Woolen.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Frank K. Mott, Mayor, Oakland, Cal., has asked congress to provide funds for the proper dredging of local harbors for the accommodation of deep water shipping.

Board of Supervisors of San Francisco, Cal., have decided not to grant a franchise to the United Railroads for the construction of a cross town line. G. B. Willcut is Secretary of the railroads company.

The Arlington Land & Development Co., in which the Robert Marsh Co., and Wright & Callender Co., of Los Angeles, Cal., are interested, have purchased the El Sobrante De San Jacinto Ranch including 40,000 acres of land and will take immediate steps toward vast improvements including the construction of reservoirs, and extension of electric railways.

The Dredge Sierra, of the United States Dredging Co., has completed its work opposite Yuba City, Cal., on the Feather River Cutoff and will start work on another contract ½ mile south

W. G. Hunter, Engineer, has filed with the county commissioners at Stockton, Cal., a report on the Bellota Flood Problem. He recommends the construction of a dam 130 feet above low water and 950 feet in length across the Calaveras River about 6½ miles up the river from Jenny Lind, Cal. The Board has the report under consideration.

Articles of incorporation have been filed with the county clerk, at Redding, Cal., by the Mount Shasta Power Co., which proposes an immense power development project in Shasta County. The company has principal offices at San Francisco, Cal., and a capital stock of $1,000,000. According to the plans of the company a tunnel 7 miles in length will be constructed to divert the 200,000 inches of the Pit River and convey the whole stream through the mountains instead of around the Big Bend. By this undertaking, which it is estimated will require an expenditure of several millions of dollars, 250,000 h. p. can be developed electrically. The Board of Directors of the company are as follows: John Coffee Hays, Visalia, Cal.; William A. Cooper, San Francisco; R. E. Johnson, San Francisco; H. V. Gates, Hillsboro, Ore.; Jesse W. Lilienthal, Albert Raymond, A. J. Treat, San Francisco, Cal.

The Street Committee of the Mission Promotion Association, San Francisco, Cal., is taking steps toward having the Southern Pacific and the United Railroads to widen the Bernal Cut, in order that the right of way of the Southern Pacific Co., south of Randall or 31st St., will permit the passage of vehicles and other traffic besides the railroad cars.

Right of way for the proposed line from Fullerton, Cal., to Richfield has been secured by the Atchison, Topeka & Santa Fe Coast Line Ry. Co., and according to reports from that vicinity construction work will be started at once. H. C. Phillips, Los Angeles, Cal., is Chief Engineer.

The Los Angeles Ry. Co. has been granted a franchise to operate an electric railway on Alpine St., from the intersection of San Fernando and Alpine Sts., to Buena Vista St. and on Ann St., from the intersection of Main and Ann to San Fernando.

The United Railroads of San Francisco, Cal., have agreed to grant the request of the Mission Promotion Association of that city to extend the new Cortland Ave. line from Mission St., along Mission to Third, thence to Kearny, Broadway and East St., and the ferries. The Association has also asked the United Railroads to extend the Polk and Mission lines from Onondaga Ave., and Mission St., to the County line.

Surveyors are running lines for the construction of a railway from Arbuckle, Cal., through Colusa to Hamilton and it is believed that a connecting line will be built from the Vallejo Northern to the Northern Electric.

Engineers are viewing the route of the projected Sacramento Valley Line from Eureka, Cal., through the mountains to some point in the Sacramento Valley and are securing data of every nature to submit to those who will be asked to finance the lines.

The Oakland & Antioch Ry. Co., which has headquarters at 347 Grant Ave., San Francisco, Cal., will, it is said, start construction work soon on its proposed electric railway from Oakland to Berkeley, Walnut Creek, Concord and Bay Point, a distance of 34 miles. H. A. Mitchell is President of the company.

The Stockton Terminal & Eastern R. R. Co., of Stockton, Cal., has secured necessary right of way and has started work on the proposed 28-mile line connecting Stockton, Linden, Waterloo, Bellota and Jenny Lind, Cal. The estimated cost of the work is $400,000. The officers of the company are as follows: M. J. Gardner, president; F. J. Dietrich, vice-president; James A. Barr, secretary; J. Egbert Adams, manager; H. W. Newell, consulting engineer.

According to a statement reported to have been made by S. B. McLenegan, general manager, Central California Traction Co., 413 Webber Ave., Stockton, Cal., the company will spend about $1,000,000 on the new line under construction from Lodi to Sacramento, Cal.

Plans and specifications for the Escondido Electric Ry. Company's line and bids for the work are to be submitted to contractors shortly. The work includes the construction of a 2,600-ft. tunnel through Scripps Summit. The company has an office at San Diego, Cal.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Necessary surveys and filings with the Interior Department of the United States Government have been made for permits, rights of way, etc., by the company projecting the construction of a hydro electric power plant on the Conejos River in Colorado. C. S. Barnes, Monte Vista, Colo., is Engineer of the company.

The Montrose & Paradox Valley R. R. is reported to be making good progress in financing its road in Colorado. The proposed line will extend into the Paradox Valley, where large irrigation projects are now under way. A connection is also planned with the Denver & Rio Grande R. R.

The Pueblo Interurban Traction Co., Pueblo, Colo., is reported to have begun work on an electric line extending from Canon City and Florence to Pueblo and ultimately to the Kansas border. The company contemplates the construction of about 100 miles of track during the year of 1910.

The Northwestern Terminal Co., of Denver, Colo., controlled by the Denver, Northwestern & Pacific Ry., and the Denver Tramway interests, has succeeded in securing the entire right of way for its proposed belt line around Denver. All preliminary financing has been completed and actual construction work will be started in the spring. The improvement will involve an expenditure of about $6,000,000 or $10,000,000. D. H. Moffat, Denver, Colo., is President of the Denver, Northwestern & Pacific Ry. Co., and is at the head of the terminal movement.

The Southern Pacific Ry. Co. has had surveys completed for the construction of a line from the main line in southern New Mexico to the coal fields at or near Durango, Colo. J. D. Mathews, Tucson, Ariz., is Division Engineer.

Thte Denver & Rio Grande R. R. is taking steps toward broad gaging the Marshall pass and Gunnison Division as far as Crested Butte, and ultimately to Montrose. Headquarters of the Third Division are now located at Gunnison instead of Salida, Colo. J. W. Deen is Division Engineer.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

At an election held by the Pacific & Northern Idaho Ry. Co., in Weiser, Ida., the following officers were elected:

President, Edgar M. Heigho, of Weiser, Idaho; vice president, F. R. Cordley of Weiser; vice president and general counsel, Samuel Morris of New York, vice J. H. Richards, resigned; treasurer, James B. Ford, of New York, vice C. W. Webb, resigned; secretary, John D. Carberry, vice C. W. Webb, resigned.

The company plans to extend its line from Council, Idaho, with the possibility that it will be met at Meadows, Idaho, by an extension of the Northern Pacific from Grangeville.

The directors of the road are Edgar H. Heigho, Weiser, Idaho, vice F. R. Cordley, resigned; Dr. J. R. Numbers, Weiser, Idaho, vice J. H. Richards, resigned; A. L. Wiley, Weiser, vice E. M. Barton, resigned; W. H. Truesdale, New York, vice C. W. Webb, resigned, and Samuel Morris, New York.

The Idaho-Inland Ry. Co. an auxiliary company of the Northwestern Lumber Co., has filed articles of incorporation and proposes the construction of a railroad from a point near Vollmer, Idaho, on the Camas Prairie Road, to the timber holdings on Craig Mountain. Survey and other data are now being prepared by engineers.

The Northern Pacific is said to be considering the abandoning of the route through Lo-Lo Pass and are having surveyors locate a route up the Little North Fork to the headwater of the stream in view of crossing the mountains by that way. The new route proposed is through the wildest part of Idaho.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Hammond, Chicago Heights & Southern Traction Co. has been incorporated with principal offices at Chicago, Ill., and a capital stock of $500,000 and proposes the construction of an electric line from some point on the Illinois State Line immediately contiguous to the corporate limits of the City of Hammond, Ind., thence in a southwesterly direction to a convenient point within the corporate limits of the city of Chicago Heights, in Cook County, thence in a southwesterly direction through the counties of Will and Kankakee to a point within the corporate limits of the City of St. Anne in Kankakee County. The incorporators and first

THE COLUMBUS TENT & AWNING COMPANY, Columbus, Ohio

Board of Directors are William S. Reed, Andrew Ward, Joseph Orr, Edward R. Davis, all of Chicago Heights, Ill., and Alfred Van Steenberg of Lansing, Ill.

The Egyptian Traction Co. has been incorporated with principal offices at Eldorado, Ill., and a capital stock of $5,000 and proposes the construction of an electric line from Murphysboro, Ill., through the counties of Jackson, Williamson, Saline, Gallatin, and White to the Wabash River. The incorporators and the first Board of Directors of the new company are G. C. Leggett, Winchester, Ind., John W. Murphy, Eldorado, Ill., John D. Stayton, Texas City, Ill., G. E. K. Hixson, Chicago, Ill., and S. W. Latham, Eldorado, Ill.

Construction work on the A. O. Fox Electric Light Plant at Galena, Ill., is being rushed to completion and steps will soon be taken toward the construction of the proposed Dubuque-Platteville Interurban.

The Chicago, Bloomington & Peoria Ry. Co. has been incorporated with a capital stock of $25,000 and principal offices at Chicago, Ill., and proposes the construction of a line from Chicago to Bloomington and Peoria, passing through the counties of Cook, DuPage, Will, Kendall, Grundy, LaSalle, Livingston, Woodford, Tazewell, McLean and Peoria. The incorporators and first board of directors of the new company are as follows: Jerome J. Danforth, Charles S. Sollars, Avern Hyde, Frank M. Campbell, Chicago, Ill.; Virginius L. Garnett, Highland Park, Ill.

It is reported that the Chicago, Milwaukee & Gary Ry. Co. is preparing to begin active construction work on its line from Joliet to Aurora in the spring. I. W. Troxel, Rookery, Chicago, Ill., is Chief Engineer of the company.

The Desplaines Valley R. R. Co., the Chicago & Northwestern R. R. Belt line has acquired all right of way for the construction of the proposed line between Elmhurst and Glencoe, Ill., costing the company about $500,000. The route as projected will run through Proviso, Leyden, Maine and Northfield, Ill.

A bill has been introduced into the Illinois State Senate granting the Chicago Recreation Pier Exposition Co. right to build a 50-ft. pier 4,000 ft. out into the lake off 31st St., Chicago, Ill.

The Hotchkiss Contracting Co., Chicago, Ill., has been incorporated with a capital stock of $50,000 and will engage in general contracting business. The incorporators are William S. Hotchkiss, Lawrence E. Hotchkiss, J. Lawrence Merritt.

The Chicago United Railway Co., of Chicago, Ill., has been incorporated with a capital stock of $2,500, and proposes the construction and operation of railroads in Chicago and the counties of Cook, Lake, McHenry, DuPage and Will. The incorporators are Chas. G. Dawes, Emile K. Boisof, George P. Hoover and Andrew Cooke.

Smith & Brown Co., Contractors, Chicago, Ill., has been incorporated with a capital stock of $60,000. Henry D. Smith, John F. Brown and George B. Smith are the incorporators.

The Chicago & Northwestern R. R. has plans laid to enter Portland, Ia. The trains will run over the Three I. R. R. from Ladd to Granville, Ill., then a line will be constructed to Portland paralleling the Oglesby & Granville branch of the Chicago, Milwaukee & St. Paul Ry. E. C. Carter, Chicago, Ill., is Chief Engineer.

The Tri City & Northwestern Ry. is to have new surveys made for the proposed line between Rapids City and Watertown, Ill. The new line will follow the river passing through Hampton. At Rapids City it is planned to go under the Milwaukee tracks together with the public highway. Wallace Treichler, Rapids City, Ill., is Chief Engineer of the company. Options on all the right of way from Watertown to Albany, Ill., are reported to have been secured.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Stockholders of the Columbus, Greensburg & Richmond Traction Co., recently held a meeting at which they took steps toward the construction of the proposed line from Columbus, Ind., to Richmond. C. F. McCallie, of Columbus, Ind., is one of the stockholders in the company.

The Bluffton, Geneva & Celina Traction Co., of Bluffton, Ind., has increased its capital stock from $30,000 to $675,000. William A. Kunkle is President of the company.

J. E. Greeley, President of the Cincinnati, Madison & Western Traction Co. is quoted as stating that construction work on the new line will begin not later than April. The route of the projected line is from Scottsburg to Madison, Ind., where it will connect with the Indianapolis and Louisville Traction Co., for Louisville and Indianapolis, Ind.

The Vincennes Traction & Light Co., of Vincennes, Ind., has decreased the capital stock of the company from $300,000 to $500. S. A. Culbertson is president of the organization.

The Wabash & North Manchester Interurban Co., of Wabash, Ind., plans to start work on the grade for the proposed line early in the spring.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Hugh L. Cooper announced recently in Keokuk, Ia., that a syndicate of New York and Boston capitalists will finance the building of the second largest dam in the world which will span the Mississippi at that point. The structure will be 5,800 ft. in length, 37 ft. height, extending 7 ft. in the solid rock bottom of the river. It will be constructed of reinforced concrete, extending straight across the river and is estimated to cost $15,000,000. The dam will create a lake extending up the river for 30 miles. It is planned to develop 200,000 h. p. at a plant on the Iowa side of the dam. The work will be done under supervision of the government.

Plans are under way for the construction of an electric interurban line from Guthrie Center, Ia., to Des Moines, by way of Dale, Redfield, Adel, Dallas Center and Grant, a distance of 55 miles. Efforts to secure right of way for the line are to be made at once. The estimated cost of the project is $27,000 a mile. A. P. Chamberlain, General Manager, Railway Promotion & Construction Co., of Des Moines, Ia., is reported to be interested in the project.

The Northwestern Construction Co. of Davenport, Ia., has been incorporated with a capital stock of $25,000. The incorporators of the company are T. J. McCarthy, H. T. McCarthy and Herman Staak.

Articles of incorporation filed in Nebraska by the Yankton, Norfolk & Southern Ry., have been revoked because the officials failed to pay occupation tax. The line was mentioned in our last issue and projected the construction of a line from Parkston, S. Dak., to Sioux City, Ia., by way of Sioux Falls, Freeman, Yankton, Centerville, Elk Point. C. A. Magee, Pittsburg, Pa., is president of the company.

The Iowa Traction Co. is planning the construction of a dam across Cedar River below Vinton, Ia. Engineers have completed surveys and proceedings for condemning the necessary land are to be effected at once.

Chicago, Milwaukee & St. Paul Ry. Co. is reported to have surveys under way for the construction of a new line east of Charles City, Ia., in order to reduce grades and eliminate curves. D. J. Whittemore, Chicago, Ill., is Chief Engineer of the railroad company.

Waterloo, Ia., has under consideration the organization of a company with a capital stock of $500,000 to build a railroad south to Tama or Belle Plaine to connect with the Chicago, Milwaukee & St. Paul and the Chicago & Northwestern R. R.

A company is being formed to construct a railroad between Waterloo, Ia., and Tama, and articles of incorporation will be filed in the near future. No name for the company has as yet been decided upon.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Preliminary surveys for the proposed line of the Kearney, (Neb.) & Beloit (Kan.) Railway are reported to be rapidly nearing completion.

According to reports the Missouri Pacific Ry. is considering the construction of a line from Sterling, Kan., to Great Bend.

The Motor Grand Traction Co. has been incorporated with a capital stock of $1,000,000, $3,940 of which has already been paid up, and proposes the construction of an interurban system in Kansas. The route of the projected line will start at the north line of Republic county, pass through Belleville, Concordia, Minneapolis, Canton, Salina, Newton and on to Wichita. It will pass through the counties of Republic, Cloud, Ottawa, Saline, McPherson, Harvey and Sedgwick and will be 150 miles in length. The directors of the company are E. S. Alnutt, E. N. Van Hosen, A. L. Litel, and Roy S. Johnson of Belleville, Kan., and W. L. Hope of Fairbury, Neb.

The headquarters of the company are at Phoenix, Ariz., and the Kansas headquarters are at Belleville, Kan.

Surveys are now under way for the construction of the proposed line for the Gulf & Northwestern R. R., through Sherman, Wallace, Greeley, Hamton, Stanton and Morton Counties in Western Kansas. The Chicago, Rock Island & Pacific R. R. is reported to be behind the project.

Charter was granted a railroad company at Topeka, Kan., to construct an interurban line from Belleville to Wichita, Kan., by way of Newton, Canton, Salina, Minneapolis, and Concordia, Kan. The capital stock of the company is set at $1,000,000 and the incorporators are all of Belleville, Kans.

The Verdigris River Drainage District No. 1, F. S. Hathaway, Engineer, has appointed A. M. Ragle, G. J. Phister and S. McMurtry as appraisers in the matter of condemning the right of way across the Hoffman land, east of Coffeyville, Kan., for levee purposes.

The Kiowa, Hardtner & Pacific R. R. Co., which has completed the line from Kiowa to Hardtner, Kan., will begin work in the spring on the proposed extension of the line through Comanche, Clerk, Meade, Seward, Stevens and Morton counties to the coal fields of Brooksfield, Colo., and Des Moines, N. Mex. The line has been leased for 20 years by the Missouri Pacific Ry. and will be operated by that company.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

W. H. Zimmerman Co. has been incorporated with principal office at Chicago and Branch office at Lansing, Mich., and will engage in general engineering.

Plans are under way for one of the largest power developments in northeastern Michigan. The project, which involves the construction of seven dams in the Tittabawassee River, starting at Edenville, Mich., and continuing into Gladwin County, is being promoted by Frank Wexson, Midland, Mich.

According to reports from the vicinity of Farmington, Mich., contracts have been let for the construction of the projected traction line from Farmington, to Lansing, Mich. Connection is planned with the Detroit Union Ry. lines at Farmington, Mich. Eastern capitalists are reported to be backing the line, which will later be extended to Grand Rapids.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A movement is on foot to construct an electric railway line from Mankato, Minn., to Twin Cities connecting with the Dan Patch Lake line in Iowa, is reported to be pushing line at Savage and entering St. Paul and Minneapolis over the right of way. J. D. Browning, promoter of the Sioux City-Spirit this project.

Stockholders of the General Electric Co., Minneapolis, Minn., are considering authorizing an issue of bonds amounting to $1,000,000 for the purpose of improving and enlarging the company's plant.

Advices from Long Prairie, Minn., state that Henry Diebel is endeavoring to finance a company to construct an electric line from Little Falls through Long Prairie to Alexandria, Minn. The company expects to obtain power for the operation of the line from the power plant on the Mississippi River at Little Falls.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Engineers have completed the survey for the projected electric interurban line between Palmyra, Mo., and Bethel. The survey passes ¼ mile south of Burksville and a 1% grade is reported from Palmyra to that point.

The Business League of Greenville, Miss., is to take up the matter with the president of the company projecting the construction of a railroad from St. Joseph, Mo., to Mobile, Ala. The line will be a trunk road, connecting the grain fields of the West with the gulf shipping, and has already been surveyed and located from St. Joseph to Fort Smith, Ark. As planned, the road will cross somewhere in the vicinity of Monticello, Ark., bearing southeast to Greenville and taking a route out of Greenville by Yazoo City, Canton and crossing the Alabama and Vicksburg railroad in the western part of Rankin county or the eastern boundaries of Scott county.

The St. Louis, Iron Mountain & Southern R. R. Co. has submitted plans to the Board of Public Improvements and City Counseler, of St. Louis, Mo., for the elevation of its tracks in order to eliminate the grade crossings at Broadway, Fourth, Sixth and Seventh Sts. James W. Way, St. Louis, Mo., is Consulting Engineer.

The Manufacturers' Ry. Co. is reported to to be planning the construction of a new line in St. Louis to supplant the present belt line around that city. G. F. Moore, South Side Bank Bldg., St. Louis, Mo., is general manager of the company.

St. Louis Items.

BY A. B. KOUNS.

W. H. Montgomery came in from Trinidad, Colo., spent a couple of days in town and left for Texas.

The collapse of the frame work of the McKinley Bridge recently, caused by the breaking of ice floes, and resulting in a delay of several months in the completion of the structure, will prevent the bridge being ready for use on April 6, the date set by ordinance, and it is likely that an extension of time will be asked of the Municipal Assembly, according to a statement made to the writer by R. D. Smith, president of the Illinois Construction Company. Under the provision of the franchise granted the McKinley System for the construction of the bridge and tracks in St. Louis and their use, April 6 was the date set. Mr. Smith, to be on the safe side, believes it best to have an extension by the city and will in a few days have introduced in the Assembly a bill granting an extension of six months.

The Iron Mountain Railroad Company last week submitted plans to Mayor Kreismann for an elevated track south of Poplar street to take the place of the track now used by that road on the surface of Poplar street from Eighth street to the river. The move by the road is the result of an investigation by the Board of Public Improvements to prepare an ordinance compelling the road to either remove its tracks or put them in a tunnel under Poplar street. It is likely that an ordinance will be introduced in the Municipal Assembly authorizing the company to erect the elevated road from Cupples block to Third street south. The plans submitted by the company, however, provide for a track 3 feet higher than the clearance under the free bridge approach at Chouteau Avenue under plans that have been prepared for that structure, and before the company is allowed to build the elevated track it likely will have to make terms to get under the bridge. The company suggested it would like to make things easy for the city in getting the bridge approach across its property at Chouteau Avenue and Third Street, provided the city would raise the bridge 3 feet, but the city's engineers say they are not worried about having to raise the bridge to get fair treatment. The company can not build an elevated track without a franchise and the Municipal Assembly can dictate the terms of that. According to the reports at the City Hall the company has had the plans up its sleeve for twenty years, prepared for a contest of its rights to use the surface of Poplar street. Several months ago the Board of Public Improvements took up the question of compelling the company to put its tracks under the ground, and the offer to elevate them on private property is said to be an effort to escape a subway. The tracks now are not much used, but their location makes them a menace to public safety in the grade crossings at Third, Fourth, Broadway, Sixth and Seventh Streets. Four car lines, the Fourth, Broadway, Cass and Seventh, cross the tracks at grade.

Wm. T. Rotery, bookkeeper for the J. F. Adelsberger Commissary and Supply Co., tried to stop a general fight that occurred in camp among the laborers at Dupo, Ill., after pay day last Tuesday with the result that he was cut in the back five times by one of the drunken laborers. Rotery was brought to East St. Louis and placed in the Henrietta hospital where his condition is said to be serious.

Grant Bros. have a grader outfit idle at Monmouth, Ill.

W. A. "Black Bill" McDonald writes us from Missoula, Mont., that he is idle there at present.

Wood blocks are becoming more popular in the city since the pavements on Washington boulevard and Westminster place have stood the test for so many years. Merchants have come to the conclusion that they are desirable for the business district and street commissioner Travilla is convinced of their durability. Since the laying of wood blocks on Olive street petitions have been filed for the same treatment for Fourth street between Washington Avenue and Chestnut Street. Another petition was filed by business men along Washington Avenue between Fourth and Twelfth streets, the center of the wholesale district. Two petitions for the same pavement have been been filed for Rauschenbach Avenue from Benton to Herbert Street and Washington boulevard from Kingshighway to Union boulevard. A public hearing has been arranged by the Board of Public Improvements for February 4 on the improvement of the following streets: San Francisco Avenue, from Fair Avenue to Newstead Avenue; Slattery Street from Montgomery Street north 225 feet; North Market Street, from Kingshighway boulevard to Union boulevard; Ohio Avenue, from Miami Street to Cherokee Street; Hereford Street, from Bishoff Avenue to Northrup Avenue; San Francisco Avenue, from Taylor Avenue to Cora Avenue, Newcomb place from Walton Avenue east 285 feet; Newcomb place, fram Marcus Avenue west 272 feet; Louisiana Avenue, from Eiler Street to Neosho Street; Elliot Avenue, from University Street to Herbert Street; Glasgow Avenue, from Dodier Street and intersection with Parnell Street and Barrett street; McLaran avenue, from Broadway to Church road; Pacific Avenue, from Chouteau Avenue to Papin Street; Margaretta avenue from Taylor avenue to Cora Avenue; Compton Avenue, from Meramec Street to Gasconade Street; Keokuk street from Missouri Avenue to Broadway; Adelaide Avenue, from Florissant Avenue to Rosalie Street; Rosalie Street, from Carter Avenue to Fair Avenue; Forest Avenue, from Manchester Avenue to Plateau Avenue; Tyrolean Avenue from Salzburger Avenue to Gravois Avenue; Habsburger Avenue, from Salzburger Avenue, from Loughborough Avenue north 618 feet; Stanley avenue, from McCausland Avenue to Blendon place, Kingshighway southwest, formerly Kansas Street, from Colorado Avenue to Grand, Kingshighway; Grand Kingshighway, formerly Grand Avenue between Kingshighway southwest formerly Kansas Street and Bates Street; Grand Avenue from Bates Street to Neosho Street; Kingshighway boulevard from Gravois Avenue to Nottingham Avenue; Kingshighway boulevard from Nottingham Avenue to Arsenal Street; Mississippi Avenue from Geyer Avenue to Lafayette Avenue; Nineteenth Street, from North Market Street to St. Louis Avenue; Palm Street, from Fourteenth Street to Twentieth Street; North Market Street from Broadway to Fifteenth Street; Fourth Street from Chestnut Street to Washington Avenue; Washington Avenue, from Fourth Street to Twelfth Street; Washington Avenue from Kingshighway boulevard to Union boulevard; Rauschenbach Avenue, from Benton Street to Hebert Street.

Another bond issue, to complete the approaches to the Municipal free bridge, construct sewers and for such other public improvements as are needed, is now being considered by the Board of Public Improvements. Mayor Kreismann and Comptroller Taussig will confer with the board during the week at which time it will be determined whether a bill for another bond issue will be sent to the Municipal Assembly. The members of the Conference Committee of the Municipal Assembly also will attend. That the board is anxious to have the free bridge accessible as early as possible is evident from the fact that all the contracts were let as rapidly as the ordinances were passed and the provisions of the charter would permit the advertisements for proposals. The sewer question has been giving the board much trouble of late. The members have been anxious to begin work on the River des Peres. Contracts have been let for the River des Peres foul-water sewer in the extreme southern section of the city, but the big sewer through Forest Park cannot be considered for the present because of the lack of funds. Plans for this have been prepared and surveys all made and the only drawback is the lack of available funds. By a bond issue the board hopes to be able to handle this, together with sewers in both North and South St. Louis. Additional funds for the completion of Kingshighway boulevard in the northern part of the city will be needed, and this will be included in the bond issue if it should be agreed to send the bill to the Municipal Assembly.

Frank B. Dietz, a prominent contractor of Edwardsville, Ill., died last Tuesday after an illness of two months. He is survived by his wife and 7 children.

"Shorty" Wells is at Nysasa, Oregon.

The board of Public Improvement last week announced a public hearing for February 4 on the improvement of thirty-six streets. In the list are Washington Avenue from Fourth Street to Twelfth and Fourth Street from

BAKER & LOCKWOOD MFG. CO., Kansas City, Mo

Chestnut Street to Washington Aveniue, both to be paved with wood blocks. Four stretches of Kingshighway are included in the list. Following are the streets: San Francisco Avenue, Fair to Newstead; Slattery, 225 north from Montgomery North Market, King's Highway to Union; Ohio, Miami to Cherokee, Hereford, Bischoff to Northrup; San Francisco, Taylor to Cora, Newcomb, 285 feet east from Walton; Newcomb, 272 feet west from Marcus; Louisiana, Eiler to Neosho; Elliot, University to Hebert; Glasgow, Dodier to Parnell at Barrett; McLaren, Broadway to Church road; Pacific, Chouteau to Papin; Margaretta, Taylor to Cora, Compton to Meramec to Gasconade; Keokuk, Missouri to Broadway; Adelaide, Florissant to Rosalie; Rosalie, Carter to Fair; Forest, Manchester to Plateau; Tyrolean and Habsburger, Salzburger to Gravois, Salzburger, 618 feet north from Loughborough; Stanley, McCausland to Blendon; King's Highway, Southwest (Kansas Street) Colorado to Grand King's Highway (Grand Avenue), King's Highway Southwest to Bates; Grand, Bates to Neosho; King's Highway, Gravois to Nottingham, King's Highway, Nottingham to Arsenal; Mississippi, Geyer to Lafayette, Nineteenth, North Market to St. Louis; Palm, Fourteenth to Twentieth; North Market, Broadway to Fifteenth, Fourth, Chestnut to Washington; Washington, fourth to Twelfth; Washington, King's Highway to Union; Rauschenbach, Benton to Hebert.

Dr. J. S. Hasty, 511 S. 3rd St., Lamar, Colo., writes us that the Fort Lyon Canal Co. will have about 300,000 yards of earth to move which is mostly dredging work and he wants the addresses of persons interested in dredges who want to figure on this.

J. W. Skinner returned from his ranch in southwest Missouri. Expects to spend at least a week in town.

The Missouri, Kansas & Texas Railway Company has notified the city that it will remove its tracks on Aurora avenue from Ferry street to the river front. The tracks were laid without authority from the city, and City Attorney Tom Anderson issued a summons against them to appear in Police Court.

Work is to begin as soon as river conditions permit upon a system of dikes to protect the lowlands about Harlem in Clay County, Missouri from flood water. The North Kansas City Levee District Association authorized by law several months ago, was organized formally at a meeting held in the office of the justice of the peace in Harlem last week. Five supervisors were chosen who will direct the apportioning of expense among the property owners and the work of building the dikes. The supervisors selected are F. W. Fratt, president of the companies holding the Armour-Swift-Burlington lands; C. M. Carter, assistant treasurer of the Chicago, Burlington & Quincy Railway; I. H. Rich, manager of the Swift Packing Company here; C. M. Crouse of Harlem, and Hugh J. Curran, secretary of the Armour-Swift-Burlington Companies. Mr Fratt drew the one year term and was elected chairman and Mr. Curran the five year term and the secretaryship. Mr. Carter got the two year term and Mr. Rich the three year term. Mr. Crouse will serve four years. The dike will begin upriver, three miles above Harlem, at the Perkins farm. The west main track of the Burlington Railroad is to be raised to form a dike from this point to the north end of the Hannibal bridge. This dike is to be three feet above the highway mark of the flood of 1903. The dike will continue following the harbor line down the Missouri River to a point opposite Rock Creek. Here it will be turned inland and extended as an inland dike to the Wabash and Burlington tracks at Rock Creek. This inland dike will be extended along the bluffs so that back water cannot flow into the district. This dike will intersect the point of beginning at the Perkins farm. Thirty-five thousand feet of dike will be constructed and the estimated cost of the work is $540,000.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Somer, Polson & Missoula Ry. Co., has been incorporated with a capital stock of $50,000 and proposes the construction of an electric line from Kalispell, Mont., to Polson and eventually to a connection with the Northern Pacific R. R. on the South and with Whitefish and Columbia, Mont., on the North. The incorporators of the company are as follows: J. A. Coram, F. H. Nash, T. D. Long, E. R. Gay and A. L. Jacquit, Kalispell, Mont.; James A. Talbott, Columbia Falls, Mont.

The Whitefish and Polson Electric Railway Co. has been incorporated with a capital stock of $200,000 and headquarters at Kalispell, Mont., and proposes the construction of an electric railroad from Kalispell, northward to Whitefish and southward through Somers and Polson on the West Shore of Flathead Lake. The incorporators are G. H. Adams, J. H. Stevens, Joseph Edge, D. Ledgerwood, O. P. Mosby and Peter Nilson, all of Kalispell, Mont.

Nebraska Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The United States Government has rejected all bids for the construction of the Pathfinder dam in Wyoming and will do the construction work during the coming summer with its own forces. The dam which will store 1,000,000 acre ft. of water is to cost $1,500,000. The water will be used to irrigate 350,000 acres of land in western Nebraska and in eastern Wyoming. R. H. Davis is Superintendent of Construction.

Articles of incorporation have been filed in Pierre, S. Dak., by the Omaha Western & Lincoln Ry. Co., with a capital stock of $3,000,000 and headquarters at Highmore, S. Dak., and proposes the construction of a 200-mile line extending from Omaha, Neb., to Hastings, with a branch to Lincoln, Neb., where the business office of the company is located. The incorporators of the new company are as follows: Frank E. Schaaf, Charles Lee, Lincoln, Neb.; A. P. Tilley, Osceola, Neb.; Charles Butler, Kenesaw, Neb.; E. J. Quirk, Highmore, S. Dak.

The Union Pacific Ry. Co. has filed survey plats at Cheyenne, Wyo., confirming the long rumored plan of the company to construct a cutoff which will shorten the main line 40 miles and save 1,000 ft. in the climb to the grade crest of the Black Hills of Wyoming, and leave Cheyenne, Laramie, Sidney and other towns south of the main line. As planned the Northport, Neb., branch will be extended to a junction with the main line at Medicine Bow, Wyo., to form a new main line from Chappell, Neb., to Medicine Bow, Wyo. Among the tunnels included in the work are two, one being 15,500 ft. in length and the other 3,100 ft. A. L. Mohler, Omaha, Neb., is vice president and general manager of the company.

New Jersey Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Officials of the Phillipsburg & Washington Trolley Co., of Phillipsburg, N. J., announced, according to reports, that the line will be extended from Port Murray, the present terminus to Hackettstown and thence to Lake Hopatcong, where it will connect with the Morris County Traction Co. Construction work will be started early in the spring.

Ordinance granting a franchise to the Stroudsburg & Delaware Water Gap St. Ry., Stroudsburg, N. J., to extend its line to the point of the Gap, making through trolley service to Philadelphia, Pa., has been vetoed by Burgess Kelly of Delaware Water Gap.

A plan is under discussion in Port Norris, N. J., for the construction of a trolley line between West Millville and the New Jersey Southern R. R., at Haleyville, N. J., to connect with Millville and Port Norris.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Paul J. Rainey Pier Co., New York, John L. DeSaulles, President, has signed a contract for the construction of the proposed pier, which will be constructed of steel and concrete and will extend 1,500 ft. over the Beach and Ocean. Work will commence at once.

Plans are being prepared by Henry Robert, one of the Engineers, who planned the Sea Wall at Galveston, Tex., for the construction of a concrete dam across the Susquehanna River west of the Lackawanna Railroad bridge in Oswego, N. Y. The dam, which is estimated to cost between $10,000 and $12,000, will probably be constructed during the coming summer.

A. J. Stafford, representing the Beebe Syndicate interests is securing right of way for the construction of an electric line from Sodus, N. Y., and Port Byron to Red Creek. It is believed that it is planned to construct a railway from Red Creek to Wallington, through the towns of Wolcott, North Rose, and Alton, to connect with the Rochester & Sodus Bay Ry. and the Pennsylvania R. R. The length of the proposed road is 4 miles.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Nearly all right of way has been secured by the company projecting the construction of an electric interurban line from Conneaut, O., to Ashtabula. The road is financed by a number of New York capitalists. Offices of the company have been opened at Ashtabula, O.

The Baltimore & Ohio R. R. Co. is to start work in the spring on its proposed ore docks at Lorain, O. The new docks will extend 400 ft. into the lake and will be surpassed by no other harbor on the great lakes. Hoists and conveyors will be operated by electricity. A. M. Kinsman, Baltimore, Md., is Chief Engineer of the company.

The Mahoning Water Co., Mahoning, O., has purchased 25 acres of land in the Squaw Creek Valley for the construction of the proposed reservoir in that locality.

The Cleveland, Cincinnati, Chicago & St. Louis Ry. Co. is planning improvements in Carey, O., necessitating an expenditure of about $30,000. The work includes the construction of a round house, turn table and new freight tracks.

The Fostoria, Napoleon & Defiance Ry. Co. has been incorporated with a capital stock of $10,000 and proposes the construction of an electric line through Seneca, Wood, Henry, Hancock and Defiance Counties. The incorporators of the company are W. S. Reece, R. T. Betts, George Schreck, Charles A. Ater and Charles A. Bliss.

Peter McCave, Greenford, O., is reported to be interested in the proposition to construct an electric railway from Salem, O., to Youngstown by way of New Albany, Green-

ford, Calla, Canfield and Lanterman's Falls, with a branch from a point near Gettysburg south to Washingtonville, Leetonia, Franklin Square and Shelton's Grove to Lisbon, O. The construction of a belt line at Salem is also under consideration by the promoters.

E. J. Landor, contractor for constructing the government dam at Ellis Station on the Muskigum River in Ohio, has suspended work for the winter. Work will be resumed about the last of April or the first of May.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Beaver Valley & Northwestern Ry. Co. has established general offices at Beaver, Okla. The company was chartered about two years ago to construct a line from Wichita, Kan., across Northern Oklahoma to New Mexico.

The Wichita Falls & Northwestern R. R. Co. is planning the construction of a line from Altus, Okla., to Wellington, Tex., by way of Hollis, Duke, Gibson and Wilkes. The company is also engaged in constructing a line across western Oklahoma. R. A. Thompson, Wichita Falls, Tex., is Chief Engineer of the company.

According to an announcement reported to have been made by J. H. Crouch, attorney of the recently incorporated Webber Falls, Shawnee & Western R. R. Co., surveys have been made from Checotah to Shawnee, Okla. The company which is capitalized at $100,000 proposes the construction of 105 miles of line from Webber Falls, Okla., to Shawnee, Okla., passing through the towns of Warner, Checotah, Weleetka, Wetumpka, and Shawnee. The Board of directors are as follows: A. R. Peyinghaus, Muskogee, Okla., general manager; J. F. Sparrow and J. B. Crouch, Porum, Okla.; O. L. Hayes, Webber Falls, Okla.; Campbell Russell, Warner, Okla.

The Oklahoma City Junction R. R. of Oklahoma City, Okla., has filed an amendment to its charter increasing its capital stock from $10,000 to $1,000,000.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

L. B. Wickersham, Portland, Ore., General Manager of the United Railways Co., has announced that the construction of the line between Portland and Forest Grove, a distance of 28 miles, will be completed by June, 1910. The company also plans the construction of a branch line to Hillsboro from Glencoe, a point on the main line now under construction.

The right of way is said to have been acquired for the construction of the proposed St. John-Troutdale line of the Oregon Railroad & Navigation Co., and construction work will be started in the spring. The proposed line is 16 miles in length and is estimated to cost $700,000. The new line is intended to be used as a second track entrance into Portland, Ore.

The Pacific & Eastern R. R. Co., William Gerig, Medford, Ore., Vice resident and Chief Engineer has under construction a 25-mile extension from Eagle Point to Butte Falls, and is said to be planning to run the road across the Cascade Range to a connection with the Oregon Short Line R. R. The work now under way is estimated to cost $400,000. The Concord Construction Co., of Portland, Ore., has filed articles of incorporation with the Secretary of State. The company has a capital stock of $10,000 and the incorporators are D. Madonna, D. Ragnone, N. Casciato and F. A. Bisotti.

Reports from Portland, Ore., state that a company has been formed and proposes the construction of a canal from Flores Lake in Curry County to the Pacific Ocean and equip it with locks and jetties, thus making the lake a harbor for all coastwise vessels.

United States District Attorney John McCourt, on the part of the government took judgment before Federal Judge Robert S. Bean, providing that the Wilson Irrigation Co. should tear down the partly constructed dam across the Umatilla River, which is alleged will divert the waters of the stream menacing the Umatilla irrigation project of the Reclamation Service, which is planned to irrigate 20,000 acres in the Umatilla County, Ore.

Contracts are to be let at once for the straightening of the Oregon Railway & Navigation Company's line between Pendleton, Ore., and Yoakum, a distance of 15 miles. G. W. Boschke, Portland, Ore., is the Chief Engineer of the company.

According to a statement reported to have been made by J. P. O'Brien, (Portland, Ore.) Vice President and General Manager of the Oregon Railway & Navigation Co., an expenditure of $1,020,000 has been authorized for straightening the line between Yoakum and Pendleton, Ore., a distance of 12½ miles. The work includes the construction of a 1,100 ft. tunnel through solid rock in order to eliminate the horseshoe curve and also the construction of two 300 ft. steel bridges over the Umatilla River. The 75-lb rails now in use on this section will be replaced with 90-lb stock. The line will be shortened 1.7 miles and will eliminate the 11,361 degrees of curvature and 48 ft. of adverse grades. Work will be started as soon as possible.

The Mount Hood R. R. Co. is contemplating the construction of a 75-mile line to connect with the Oregon Railroad & Nevigation Co. lines. Joseph W. West, Hood River, Ore., is Chief Engineer of the company.

The Rogue River Valley Ry. Co. has issued bonds amounting to $125,000 for the construction of a 9-mile extension between Jacksonville, Ore., and Ruch. W. H. Barnum, Jacksonville, Ore., is vice president of the company.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Tuscarora Railroad Co. has been chartered at Harrisburg, Pa., with a capital stock of $450,000 and proposes the construction of a 45-mile line from Blair's Mills, Huntingdon County, to a point in Fulton County, Pa., where Licking Creek crosses the line between Pennsylvania and Maryland. The incorporators of the company are as follows: George L. Catlin and L. S. Catlin, Bridgeport, Conn.; L. S. Farlee, New York, N. Y.; M. G. Addison, New York, N. Y.; D. H. Patterson, Webster's Mills, Pa.; J. M. Blair, Blairs Mills, Pa.; N. H. Suloff, Rossfarm, Pa.; N. S. Ross, York, Pa.

The Philadelphia & Reading R. R. has let a contract to C. F. King & Co., for grading and masonry work for the construction of a fourth track from Perkiomen Junction to Phoenixville, Pa., a distance of 1½ miles.

The Pennsylvania R. R. has awarded James McGraw Co., Philadelphia, Pa., the contract for changing the present four-track through Bristol, to eliminate ten grade crossings and an undesirable curve. The work involves the construction of four tracks one and one-half miles long and 10 bridges.

The Pittsburg & Great Lakes Connecting Co., with offices at the Fulton Bldg., Pittsburg, Pa., was recently chartered and engineers are now making final surveys for the construction of 42 miles of road from Ellwood City to Raymilton, Pa., forming a connecting line between several trunk lines and shortening the distance between this city and northeastern points on the New York Central Lines. The new road will require the construction of two bridges and three tunnels, the latter being 400, 1,200 and 2,200 ft. long. The company has completed plans for the construction of 12 miles line connecting the Pittsburg & Western R. R. at Ellwood City with the Western Allegheny R. R. at Portersville and extension will ultimately be built to Grove City and Raymilton, connecting with the Bessemer & Lake Erie and the Lake Shore road.

The Renova & Gleasonton St. Ry. Co. has been chartered in Pennsylvania with a capital stock of $30,000 and proposes the construction and operation of a 5-mile trolley line in Clinton County, Pa. The Board of Directors of the company are as follows: R. V. Rogers and W. B. Reilly, Renova, Pa.; J. H. Crissman, Dubois, Pa.; L. W. Gleason, Gleasonton, Pa. E. W. Hess, Clearfield, Pa., is president of the company.

Tennessee Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Clarksdale, Covington & Collierville Interurban Ry. Co. has submitted an ordinance to the Board of Commissioners of the city of Memphis, Tenn., asking for a charter authorizing ten new routes in that city, including a cross town and belt line.

The stockholders of the Clarksville Ry. & Light Co. met Jan. 4 and reorganized the company and elected the following officers: N. L. Carney, President; L. E. Fischer, Danville, Ill., Vice President and Treasurer; George Burton, Peoria, Ill., Secretary; A. C. Murray, Assistant Secretary and General Manager. The new company contemplates a number of improvements including the construction of an extension of its lines to Dunbar's Cave and New Providence, Tenn.

Work has been resumed on the Memphis-Chattanooga R. R., a subsidiary company of the Southern Ry. Twenty miles of the road had been graded and all right of way secured when the work ceased in 1906. The line is projected from Stevenson, Ala., to Chattanooga, Tenn. W. H. Wells, Washington, D. C., is Chief Engineer of Construction for the Southern Ry.

The Central Construction Co., of Shelby County, Tenn., has been incorporated with a capital stock of $25,000. The incorporators are C. E. Terrell, H. P. Woods, C. B. Rutledg, T. A. Evans and G. T. Fitzhugh.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The St. Louis, Brownsville & Mexico R. R. Co., recently acquired by the (Frisco) St. Louis & San Francisco R. R. is planning an expenditure amounting to $25,000,000 for the construction of a line into Mexico and for branch lines in Texas. C. B. Rogers, Kingsville, Tex., is General Manager of the St. Louis, Brownsville & Mexico R. R. Co.

W. H. Denison, who has the heaviest contract on the Coleman-Texico Cutoff in Texas of the Santa Fe R. R., cutting down the cap rock, expects to finish work in about six months. The contract includes 3 miles and amounts to more than $200,000.

Judge R. G. Johnson, Chairman of the Board of Commissioners of the Fort Worth Improvement District No. 1, Fort Worth, Tex., announces that owing to a lack of funds bond issuance has been delayed and actual construction work will not be started before March 1.

A movement is on foot to reconstruct a reinforced concrete dam across the Colorado River at Austin, Tex. In 1900 a dam at this site was washed away. The structure was 1,275 ft. long and 67 ft. above bed rock.

The Rio Grande Construction Co. of Brownsville, Tex., has filed an amendment to its charter increasing its capital stock from $10,000 to $50,000.

Company is being formed for the construction of an immense dry dock at Fort Arthur, Tex. No plans has as yet been considered.

Mayor of Austin, Tex., is to take up the matter with the county commissioners of having plans and specifications prepared for the construction of a dyke on the south side of the river bridge. Bide for the work will be advertised later.

Directors of the proposed Brownwood North & South R. R. of Texas, proposes the construction of its line to May, Tex., providing that town subscribes $20,000 of bonds. Charter for the company has not yet been secured.

Surveys are now under way for the construction of the proposed railroad between Waco and Georgetown, Tex., by way of Belton. Joseph Goddard, Waco, Tex., County Surveyor and Judge Felt, Belton, Tex., are interested in the new project.

Surveys for the proposed Dallas-Terrell Interurban Ry. have been completed as far as Forney, Tex.

W. C. Carmile, of Dallas, Tex., is at the head of a movement to construct a 40-mile railroad from Pecos, Tex., to San Solomon Springs via Saragosa and Balmarshea to the head of Toyah Creek. Committees are now

securing subscriptions to the bonus fund necessary for the construction of the road.

Texas Central R. R. Co. is to extend its line from DeLeon to Rising Star and Cross Plains. Surveys have been made and grading will be started the latter part of January. C. H. Sharman, Waco, Tex., is Chief Engineer of the railroad.

A plan is under way involving the construction of a railroad from Gardendale, a station on the International & Great Northern R. R. to Brundage, Tex., in Dimmit County. J. R. Brown, Carrizo Springs, Tex., is reported to be interested in the project.

S. A. Robertson, San Benito, Tex., representing a syndicate of capitalists of St. Louis, Palestine and Pine Bluff, Ark., is promoting the construction of an interurban line from San Benito, Tex., to the Rio Grande. Preliminary surveys have already been made and all financial arrangements have been perfected and construction of the line will commence as soon as the property owners along the line sign bonus contracts. It is expected that about six months time will be required for the construction of the road.

The Abiline Central R. R. has been chartered with a capital stock of $150,000 and headquarters at Abiline, Tex., and proposes the construction of a railroad from Abiline southeasterly through the counties of Taylor, Callahan, Eastland, Brown, Commanche, Mills. Hamilton, Coryell and McLennan to Waco, Tex., a distance of 150 miles. The incorporators of the company are as follows: D. T. Bomar, Fort Worth, Tex.; Morgan Jones, Abiline, Tex.; John Guitar, J. M. Radford, Henry James, H. O. Wooten, C. W. Merchant, George L. Peyton, W. G. Swenson and Ed. S. Hughes, Abiline, Tex. The company is said to be subsidiary to the Colorado & Southern Ry.

The El Paso & Fort Hancock Ry. Co., capitalized at $100,000 to construct a railroad line from El Paso to Ysleta, Tex., a distance of 10 miles has succeeded in securinng subscriptions amounting to $55,000. C. N. Bassett, El Paso, Tex., is president of the company.

The James Black Masonry & Contracting Co. has been granted a permit to operate in Texas. The company is a St. Louis, Mo., firm and has a capital stock of $5,000. The Texas office is at Austin, Tex.

According to an estimate of F. U. Taylor, University of Tex., the proposed municipal dam across the Guadalupe River below the International & Great Northern Bridge in the city of New Braunfels, Tex., will cost the city $15,000. The work will require 1,900 cu. yds. of reinforced concrete.

The Galveston-Houston Electric Ry. Co., of Houston, Tex., has issued bonds amounting to $5,000,000 and will commence construction work on the proposed line from Galveston, Tex., to Houston, Tex., in a short time. The company has mortgaged its holdings in Texas to the City Trust Co., Boston, Mass., for $5,000,000.

Plans and specifications have been prepared by the Municipal Board of Commissioners of Dallas, Tex., for the construction of the proposed dam at White Rock reservoir site, and City Secretary is to call for bids for the work at once. As planned the dam will be 2,100 ft. long, 211 ft. wide at the base and 16 ft. wide at the top, and 42 ft. high, with a 450-ft. spillway two feet below the level of the dam. The upper face of the dam is to be of concrete to a distance half way the verticle depth of the dam and half the face, extending from end to end. The entire cost of the work is estimated at $750,000. Each bid is to be accompanied by a certified check for $5,000.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Gould interests are preparing to lay plans for the construction of an electric railroad from Norfolk, Va., to Washington, D. C. Permission was received from the legislature some years ago to construct a line from Washington, D. C. to Richmond, and plans to extend the line which almost parallels the Richmond, Fredericksburg & Potomac Ry., to Norfolk, are now under way. W. G. Whitney, Chief Engineer of the Gould interests is now busy making surveys for the new work.

Work on the Richmond & Chesapeake Bay R. R. will be started some time this year it is said. Surveyors under Cecil L. Reid, Fredericksburg, Va., are now in the field making locations for the proposed lines, one from Fredericksburg to Ashland and the other from Fredericksburg to Washington.

The Western Maryland R. R. Co. is reported to have necessary funds raised for the construction of the contemplated line from Cumberland, Md., to New Haven, Va., and construction work is to be started at once. H. R. Pratt, Baltimore, Md., is Chief Engineer of the company.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Residents of South Bend and Raymond, Wash., are taking steps to secure an appropriation of $250,000 from Congress for the purpose of dredging a channel 18 ft. deep from Willapa Harbor Bar to Raymond, Wash. Surveys for the proposed improvement were made last summer.

The new Valley Railroad & Power Company, recently incorporated, which is contemplating the construction of an electric railroad between Kent, Wash., Orillia, O'Brien and Renton, will place its stock on the market within a few weeks. Surveyors are now going over the proposed route to locate the line of the road. As soon as the engineers make their final estimate it is planned to capitalize the company, probably at $300,000. The officers of the company and original incorporators are: H. B. Madison, of Kent, president; Robert Bridges, of O'Brien, vice president; Isaac P. Calhoun, of Kent, Wash., secretary; Thomas Chapman, of O'Brien, Wash., treasurer; Lee Chapman, of Renton, Wash., auditor. A. T. West, of Seattle, who is manager of the Independent Telephone Company of the White River valley, is to be general manager.

The Construction Department of the Northern Pacific has turned over to the Operating Department, the entire double track on the division between Vancouver and Kalama, Wash.

Anacortes, Wash., City Council has granted E. G. English a franchise to construct a railroad through this city.

The Grand Trunk Pacific Dock Co., with a capital stock of $150,000 has been organized on the west coast. The first undertakings of the new company will be to construct new docks at Seattle, Wash., Victoria and additional docks at Prince Rupert. The officers are: President, Chas. M. Hays; vice-president, Capt. J. S. Gibson, of the McCabe and Hamilton Stevedoring Company; secretary-treasurer, Henry Philips, Montreal, Can.; assistant secretary, Somers Hayes Smith. The trustees are Mr. Chas. M. Hays, E. J. Chamberlain, Capt. J. S. Gibson, Somers Hays Smith and L. V. Druce.

Work is reported to be progressing very satisfactorily on the double track of the Northern Pacific and Oregon & Washington joint line between Tenino and Kalama, Wash. Winston Bros. & McDougal are the contractors.

The Chicago, Milwaukee & Puget Sound is reported to have recently closed a contract for the construction of an extension of the Tacoma & Eastern R. R., which is controlled by the former company. The T. & E. R. R. extends south from Tacoma, Wash., 50 miles to Glenavon, with a branch to Ashford. The new work will extend from Glenavon 20 miles south and is supposed to be the first step of the Milwaukee to enter Portland. John Bagley, Tacoma, Wash., is Vice President and General Manager of the Tacoma & Eastern R. R.

The Puget Sound & Baker Ry. Co., generally known as the English-Dempsey Logging Co., is to take steps immediately toward the extension of its line from Baker City to Anacortes, a distance of 25 miles. The company now operates about 25 miles of road. The route as projected will follow that of the Rockport Branch of the Great Northern R. R. for a part of the way.

The Couteau Power Co., Okanogan, Wash., is promoting a new railway project and asks the interested municipalities of White Valley to guarantee bonds to the extent of $2,000,000, supplementing $2,000,000 of British capital already in hand for construction. The proposed line is to extend from Enderby to Penticton and Summerland, Wash.

The Toppenish, Simcoe & Western R. R. Co. has surveys under way for the construction of its line to Goldendale, Wash., and contracts for grading the first 17 miles of line have already been let. The estimated cost of the work, which will include 80 miles of track, is $2,000,000. F. A. Williams, Toppenish, Wash., is interested.

The Northern Pacific Ry. Co. is reported to be planning the construction of improvements in the vicinity of Seattle, Wash., estimated to cost the company about $5,000,000. The work includes the encircling of Lake Union with a line and changing the main line between Ballard, a substation of Seattle, and Fremont. Under the franchise granted the company by the council a short time ago the new line will begin at Shilshole Ave., and West 45th St., and run to Eighth Ave. N. W. It will be a four-track line and changes the main line to new grades made necessary by the proposed canal. A. R. Cook, Tacoma, Wash., is Engineer of the Maintenance of Way.

The North Coast is reported to have started surveys for the construction of a line in Klickitat County in the vicinity of Camas Prairie, north of Bristol, Wash.

Articles of incorporation have been filed by the Woodland Water & Power Co., of Woodland, Wash. The company is capitalized at $50,000. The incorporators are S. A. Burns, E. L. Burns and G. K. Gilluly.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A stock company with a capital of $25,000 was recently organized at Prairie Farm, Wis., and proposes the construction of a railroad from that place to a point on the Wisconsin Central division of the Minneapolis, St. Paul & Sault Ste. Marie R. R. The line as projected will pass through Graytown and Downing terminating at Glenwood or directly through to Emerald with a terminal at that point.

The Central Construction Co., according to reports, has been dissolved and Robert Wynn will, it is said, form a new company to take up the construction of the proposed road between Waukegan and Kenosha, Wis.

Surveys are being made for the construction of a railroad line between New Richmond, Wis., and Somerset. It is generally believed in this section of the country that the Minneapolis, St. Paul and Sault Ste. Marie R. R. Co. is planning to abandon its present line over the St. Croix River west of Somerset. Thomas Green, Minneapolis, Minn., is Chief Engineer of the company.

The Chicago & Northwestern has secured all right of way for the double track from West Allis to Clyman, Wis., a distance of 55 miles and grading will be started soon. The company also has under consideration plans for the construction of a belt line around Milwaukee, Wis. W. W. Gaffin, North Fon du Lac, Wis., is Division Engineer.

Right of way for the proposed line of the Maplehurst & Black River R. R. is completed from the Ladysmith branch of the Minneapolis, St. Paul & Sault Ste. Marie R. R. to Maplehurst, Wis., and work will be discontinued until March 1. The company expects to have 15 miles of the road in operation by Jan. 1, 1911.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Alberta & Great Waterways Ry. Co., mentioned in our issue of Jan. 12, which was recently incorproated to construct a line in Alberta, from Edmonton, a city on the great transcontinental railways, Canadian Pacific, Canadian Northern and Grand Trunk, almost

due north to a point near Fort McMurray, has final surveys under way. The Canada West Construction Co., Ltd., with B. R. Clarke, brother of W. R. Clark, President of the railroad company, at its head, has been formed to construct the line which will be 350 miles in length. W. R. Clarke, President, who secured subscriptions in France and England, amounting to $14,000,000 for the project, also contemplates running a packet line on the water way system, formed by the Athabasca River, the Peace River and the Mighty McKenzie and also Lake Athabasca and Great Slave Lake, totaling a 3,500 water way available six months of each year.

The British Columbia Ry. Co., Vancouver, B. C., has plans under way for the construction of about 100 miles of interurban line radiating from Vancouver, and for taking over and electrifying the Victoria & Sidney Ry. on Vancouver Island.

The International Waterways Committee have under consideration the application of the St. Lawrence Power Co., Ltd., and the Long Sault Developing Co., to construct power works in the Long Sault Rapids of the St. Lawrence River. The work proposed by these companies include the construction of a dam across the St. Lawrence river at the Long Sault Rapids. No action has as yet been taken. The Commission have also under consideration the advisability of constructing a dam across Lake Erie from Bird Island Pier to Fort Erie to maintain the level of the Lake.

E. F. Wheaton and George W. Mathews, Cleveland, O., are promoting the construction of an electric railway system radiating from Kalispell, Mont.

Surveys have been made for the construction of the Buffalo-Clearmont Ry., connecting Clearmont, Wyoming, on the north main line of the Burlington with Buffalo, Johnson County seat, a distance of 38 miles.

The Panama Railroad Co., G. W. Goethals, Culebra, Panama, President, and the Isthmian Canal Commission is considering the proposition of constructing a 274-mile railroad from the city of Panama to David. The material, including rolling stock and plant equipment will be second hand, furnished by the Isthmian Canal Commission.

Reports from Chihuahua, Mex., state that preliminaries are being arranged for the immediate construction of a large dam and hydro-electric plant on the Conchos River.

Greenville, Spartanburg & Anderson Ry. Co., with a minimum capital of $300,000 and a maximum capital of $2,000,000 has been incorporated with principal offices at Greenville, S. C., and proposes the construction of an electric line from Anderson to Spartanburg. The incorporators of the company are as follows: J. B. Duke, Somerville, N. J.; B. N. Duke, New York City; W. S. Lee, Charlotte; Ellison A. Smyth, Lewis W. Parker, W. J. Thachston and H. J. Haynsworth, Greenville, S. C.

The Carolina Traction Co. has been chartered with a capital stock of $150,000 and proposes the construction of an electric railway from Rock Hill to Charlotte, N. C., passing through York and Chester Counties in South Carolina and Mecklenburg county in North Carolina. The charter also includes the right to operate an electric line through the streets of Rock Hill, S. C. The principal offices of the company are located at Rock Hill, and the officers of the organization are as follows: J. M. Cherry, president; W. S. Lee, vice president; James S. White, secretary; J. M. Cherry, treasurer.

The Governor of Mississippi has issued a proclamation authorizing the formation of the Clarksdale & Lakeview Co. and the Clarksdale & Webb Co. with a capital stock of $2,500,000. The purpose of the enterprise is for continuing the construction of the line of the Lakeview Traction Company from Memphis to Clarksdale, and thence to Webb, where connection would be had with the North and South line of the Southern Railroad from Webb to Belzoni, on the Yazoo River. The incorporators of the company are R. F. Tate, W. A. Percy, of Memphis, Tenn.; A. Walsh, D. D. Saunders, R. M. Norfleet, W. B. Neohut, I. A. Dolan, J. J. Myers, J. W. Cutrer, F. I. Williams, Henry J. Davis, W. A. Alcorn W. B. Campbell, Earl Brewer, J. H. Johnson, W. A. Montroy, R. S. Alexander, Frank Trimble, W. M. Ball, R. T. Lamb, P. Clark, G. M. Roach, S. A. Withers, J. F. Withers, E. J. Mullens and T. H. McKenzie.

The Savannah Hydro-Electric Co., which recently moved its headquarters from Jacksonville to Savannah, Ga., is to have charge of the construction of a hydro electric plant on the Cannochee River near Savannah, which will according to estimates cost over $500,000. The officers of the company are as follows: S. K. Platshek, president; D. G. Zeigler, vice president and general manager; G. H. Miller, secretary and treasurer. All location surveys for the plant, which includes the construction of a large dam, have been made.

According to reports Alexis Shriver, president Baltimore & Belair Electric Co., Belair, Md., is interested in plans to construct an electric railway connecting Baltimore, Belair and Havre de Grace. The project would necessitate an expenditure of about $1,500,000.

United States Engineers have resumed work on the survey for the Florida Ship Canal. The survey has practically been completed from Apalchicola to a point on the Suwannee River near Brantford, Fla. The proposed route will follow the Suwannee River for several miles bordering the county line. At Brantford the route will take a southeasterly direction.

According to reports from Salt Lake City, Utah, 90 miles of track on the San Pedro, Los Angeles & Salt Lake R. R. have been washed away, causing a practical loss of about $14,000,000. Steps toward the reconstruction of the line will be taken immediately and it is expected that work will be completed by September. R. K. Brown, Salt Lake City, Utah, is Division Engineer Maintenance of Way.

BIDS ASKED.

Bids are asked on following work, the notes being arranged alphabetically by states:

Bridges.

Jacksonville, Fla.—Until 9:30 a. m., Jan. 21, by Board of County Commissioners, for furnishing necessary material and labor for the construction complete of three steel and concrete bridges. A certified check for $300 must be filed with each bid. Gail L. Barnard, Jacksonville, Fla., is County Engineer.

Bryan, O.—Until 11 a. m., Jan. 31, by R. H. Weaver, County Auditor, for the construction of one steel bridge. The estimated cost of the structure is $1,790. A certified check for 5 per cent the estimated cost must be filed with each bid.

Cleveland, O.—Until 11 a. m., Feb. 5, by Board of County Commissioners, for the construction of two bridges, one on the Coe Ridge Road, Rocky River Township, and the other on River Road, Rockport Township. John F. Goldenbogen is Clerk.

Columbus, O.—Until noon, Jan. 28, by Board of County Commissioners, for the construction of a new floor system on the Decker Bridge over Little Walnut Creek, on the Groveport and Lithopolis Pike, about 1 mile southeast of Groveport; on the Grandview Ave. bridge, over the Scioto River, in Franklin Township.

Antlers, Okla.—Until Jan. 22, by Board of County Commissioners, for the construction of two county bridges. W. D. Parks is County Clerk and H. A. Evans is Chairman of the Board of County Commissioners.

San Antonio, Tex.—Until noon, Jan. 20, by Board of County Commissioners, for the construction of a reinforced concrete arch bridge across the Medina River at the Pleasanton Road crossing. The structure is to consist of two 110-ft. spans and two 30-ft. spans with an 18-ft. roadway. It will require 850 cu. yds. of reinforced concrete and approximately 1,600 cu. yds. of rubble concrete. Thomas E. Ramsey is County Auditor.

Winnipeg, Man.—Until Jan. 22, by Chief Engineer, Canadian Pacific, Winnipeg, Man., for the construction of substructure of bridge over the Saskatchewan River at Outlook.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Hot Springs, Ark.—Until 12:30, Feb. 7, by Maj. G. D. Deshon, Constructing Quartermaster, for the construction, heating, plumbing, wiring and electric fixtures for two double sets of officers' quarters at the Army & Navy General Hospital.

Washington, D. C.—Until 11 a. m., Feb. 19, by Bureau of Yards and Docks, Navy Department, for the construction of three officers' quarters at the Navy Yard, Puget Sound, Wash.

Fort Barrancas, Fla.—Until 11 a. m., Jan. 28, by Constructing Quartermaster, for the construction, plumbing, heating and electric lighting of one double set of non-commissioned officers' quarters and one band kitchen at Fort Barrancas, Fla.

Louisville, Ky.—Until 3 p. m., Feb. 18, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, including plumbing, gas piping, heating apparatus, electric conduits and wiring, of the laundry and attendants' quarters, U. S. Marine Hospital, Louisville, Ky.

Time required: 42 months. Bond, $370,000.

Bradford, O.—Water Works Plant.—Larkin Bros., Dayton, O., at $25,000, for the construction of a water works system.

Dayton, O.—Sewer.—Backus Construction Co., 950 Reibold Bldg., Dayton, for the construction of a 36-in. reinforced concrete by-pass sewer, from the east side drain along the north side of the levee to the Longworth St. pumping station. The work includes 390 lin. ft. of 36-in. reinforced concrete sewer, 7-in. shell. Bids were opened Dec. 30.

East Liverpool, O.—Filters.—Sand & Gravel Co. of this city, at $59,963, for constructing a system of mechanical filters, reinforced concrete subsiding basin, laying cast iron water pipe and constructing filter house.

Chickasha, Okla.—Laying Water Pipe.—C. P. Hollingsworth of this city, at $8,369, for laying 60,928 lin. ft. of 6-in. and 4,610 ft. of 8-in. cast iron water pipe.

Oklahoma City, Okla.—Sewer.—T. J. Mayfield, at $16,000, for the construction of two sections of the Deep Fork Sanitary Sewer. Derr Construction Co., for the construction of the third section.

Oklahoma City, Okla.—Sewers.—City Council has awarded the following contracts for the construction of sewers: McCreedie Co., at $15,762, sewers in Jordan Place, Oak Park, etc.; J. O. Severns, at $22,000, Culbertson's East Highland District; J. O. Severns, at $4,900, Blocks 10, 11, 12, etc.; McCreedie Co., at $11,523, Blocks 2, 7, 22, 27, etc.; J. O. Severns, at $17,010, Putnam Heights and Military Park.

Dallas, Tex.—Sewers.—Dallas Home Improvement Co., at 40 cents per lin. ft. and $5.50 for specials, for the reconstruction of certain sewers in Jackson St., near Austin.

Spokane, Wash.—Sewer.—Kleffner & Quaring, at $20,950, for the construction of the First Ward trunk sewer.

Vancouver, Wash.—Sewers.—Sewers Cascades Contract Co., at $17,151, for the construction of sewers in Grant, Harney, Ingalls and Jefferson Sts.

Milwaukee, Wis.—Sewer.—G. E. Zimmerman, Milwaukee, Wis., at $14.74 per lin. ft., for the construction of a concrete relief sewer on Brown St., from 26th to 30th Sts. The work will cost about $18,793, and will be 1,275 ft. long.

Cobourg, Ont.—Drain.—Samuel Cann, at 80 cents per ft., for the installation of 2,050 ft. of 8-in. vitrified tile drain. Bids were opened Dec. 12.

EXCAVATION, MISCELLANEOUS, MATERIALS.

New London, Conn.—Rebuilding Wharf.—Schwiers & Sutton Co., 90 West St., New York, N. Y., at $2,937, were the lowest bidders for the rebuilding of the timber wharf at Fort Mansfield, R. I. The work includes the rebuilding of approximately 190 ft. of runway to wharf. Bids were opened Jan. 10.

Washington, D. C.—Wire.—Bay State Insulated Wire & Cable Co., Boston, Mass., at $33 per thousand ft. for furnishing 150,000 ft. of outside twisted pair wire for the signal corps, U. S. army. Wire must be delivered within 14 days. Bids were opened Jan. 3.

Columbus, Ga.—Sewer Pipe.—E. Philips & Son for furnishing the city with sewer pipe for the year 1910.

Nevada, Ia.—Drains.—Morse & Houghsted, Nevada, Ia., at $18,501, for furnishing all necessary labor and material for the construction of county drains in District No. 20. The work includes 7 miles of 8-in. to 20-in. tile drain. Bids were opened Jan. 14.

Gary, Ind.—Building.—American Bridge Co., Pittsburg, Pa., for the erection of steel frame buildings which will cover 100 sheet mills and 100 tin plate mills, an office structure, tinning house, open-hearth department and an extensive galvanizing department for the new sheet and tin plate plant of the American Sheet & Tin Plate Co. Construction work will begin during the early part of the spring.

Jeffersonville, Ind.—Sanitary Carts.—Geo. H. Holzbog, Jeffersonville, Ind., for furnishing the office of the depot quartermaster sanitary carts, at prices as follows: Five 4 wheel, 2 horse, for all, $1,340; 10, 2 wheel, 1 horse, for all, $2,000.

Cawker City, Kan.—Pipe Line and Pump.—T. C. Brooks Sons Co., Jackson, Mich., at $15,764, for furnishing all necessary material and labor for the installation of a pipe line and pump.

The work includes the following approximate quantities: 7,050 ft. 6-in. and 15,580 ft. of 4-in. cast iron pipe; 2,250 ft. of 2-in. galv. iron pipe; 28 hydrants, etc., one 75,000 gal. tank on 125 tower, foundation, triplex pump and powerhead, etc. Des Moines Bridge & Iron Co., at $4,350, for the construction of sewer and tank.

Detroit, Mich.—Building.—The Carey Construction Co., 209-211 Lennox Bldg., Cleveland, O., at $100,000 for the construction of the Healy bldg., Woodward Ave., Detroit. Pastle & Mahler, Architects, 1732 Marquette Bldg., Chicago, Ill.

Minneapolis, Minn.—Cast Iron Pipe.—Sheffield Cast Iron Pipe & Foundry Co., Sheffield, Ala., at $26.50 per ton, for furnishing 2,600 tons of cast iron pipe for use during 1910. Crown Iron Works, Minneapolis, Minn., at $53.50 per ton, for furnishing 100 tons special castings. Bids were opened Dec. 17.

Vicksburg, Miss.—Dry Dock.—Following bids were received Jan. 5 by Capt. Clarke S. Smith, Corps of Engineers, U. S. Army, for the construction and delivery of a steel floating dry dock: American Bridge Co., of New York, Frick Bldg., Pittsburg, Pa., at $45,000, $45,000, $43,000 and $39,000; The Springfield Boiler & Mfg. Co., Springfield, Ill., at $40,400, $42,250; The Johnson Iron Works, Ltd., 1412 Duffosort St., New Orleans, La., at $47,500, $51,950; C. Trimborn, Milwaukee Bridge Co., 1400 34th St., Milwaukee, Wis., at $42,185, $42,330; Des Moines Bridge & Iron Co., Des Moines, Ia., at $44,990.

Cottage Grove, Ore.—Lights.—Cottage Grove Lighting Co., for furnishing the city with street lights for a period of five years, at $80 per year for arcs and $28 for 32 candlepower incandescents, the minimum charge to be $2,825.

Fort Moultrie, S. C.—Concrete Cisterns.—R. E. & E. N. Beaty, 100 Broad St., Charleston, S. C., at $6,453, for the construction of 7 reinforced concrete cisterns. Bids were opened Jan. 9.

Sumter, S. C.—Building.—Bartlett Heyward Co., Baltimore, Md., at $50,000, for the construction of the plant of the Sumter Gas and Light Co.

National Soldiers Home, Va.—Remodeling Electric Plant.—Newport News Ry. & Electric Co., Hampton, Va., at $4,300, for furnishing all necessary labor and material for remodeling electric plant, poles, wires, etc., to suit new plant built on home reservation. Bids were opened Jan. 11.

Winnipeg, Man.—Water Mains.—Stanton Iron Works, Nottingham, Eng., at $39,100 f. o. b., for furnishing 1,128 tons of water mains.

PROJECTED WORK.

Bridges.

Items Arranged Alphabetically by States.

Florence, Ariz.—A site has been selected for the new territorial bridge across the Gila by territorial engineer, J. B. Girand.

Sacramento, Cal.—Board of Supervisors of Sutter county will be petitioned for a bridge to cost in the neighborhood of $120,000, to be built at the town of Meridian by the counties of Colusa and Sutter and the Northern Electric Railway Co.

Pueblo, Colo.—County Commissioners of Pueblo and El Paso counties have completed arrangements for the construction of the bridge over the Fountain river at Wigwam on the county line of El Paso and Pueblo counties.

Bridgeport, Conn.—Streets and Sidewalks Committee has filed with the city auditor an item asking for the appropriation of $16,000 for a Boston Ave. bridge, and one of $6,000 for Arctic St., bridge approaches.

Columbus, Ga.—City will hold an election Feb. 17 to vote on the issuance of $100,000 worth of bonds for the erection of a new bridge.

Jackson, Ga.—Commissioners of roads and revenues have decided to build a steel bridge at Indian Springs.

Streator, Ill.—Plans for the construction of the proposed new bridge over the Vermillion river at this city have been completed by Engineer Ralph Modjeski of Chicago.

Peoria, Ill.—Blue prints of the proposed new high steel wagon bridge have been prepared by the city engineer. The bridge will be 2,700 ft. in length, beginning at the alley on Bridge St., between Adams and Washington St., and will have an abutment, being supported on 16 steel columns.

Cedar Rapids, Ia.—Petition is being signed by property owners which will be presented to the city council asking that a bridge be erected across the river at F Ave., before the Third Ave. bridge is built.

Atchison, Kan.—Citizens will vote in the spring to decide whether a new concrete bridge is to be built at Fourth and Main Sts., at a cost of $15,000. A resolution has been passed by the city council instructing the city engineer to prepare estimates on the bridge.

Brandenburg, Ky.—Judge Miller of Hardin county has ordered the construction of a bridge over Salt river, about a mile from West Point, which will connect Jefferson county with Hardin county. The bridge proper will cost approximately $60,000 and will be under the direction of a commissioner from each of the counties, to be appointed by the Fiscal Court.

Cheboygan, Mich.—Plans are being prepared by L. O. Pettyes for the construction of a bridge across the Cheboygan river for the Cheboygan Paper Co. It is estimated the structure will cost $30,000.

Detroit, Mich.—Petition has been signed by 40 freeholders asking the township board to call a second election to vote on a proposition to issue $175,000 for the building of a municipal bridge, connecting Trenton with Grosse Ile.

Detroit, Mich.—City will soon sell bonds for the construction of the new Stewart St. bridge, which will span the Miami river.

Menominee, Mich.—City Attorneys Joseph F. Cuddy of this city and Harry R. Goldman of Marinette are preparing petitions to be introduced in congress asking for permission to construct two bridges across the Menominee river.

Minneapolis, Minn.—Resolution providing for a bridge over the Narrows at Lake Minnetonka has been introduced before the board of county commissioners by William Knight, vice chairman of the board. The bridge will cost between $25,000 and $50,000.

Miles, Mont.—City Council has decided to go ahead with the construction of a new bridge over the slough at Milwaukee park to replace the one that was washed out last spring.

Buffalo, N. Y.—The Mexican or Vera Cruz Co., has under consideration plans for building a new bridge over the Barranca de Metlac. It is proposed to erect a structure which will unite the two sides of the deep valley in a direct line. The height of the bridge will be about 400 ft.

Rochester, N. Y.—Ordinance has been introduced in the city council providing for the construction of a reinforced concrete bridge, with a uniform width of 66 ft. The improvement is estimated to cost between $150,000 and $200,000.

Dickinson, N. D.—The bridge across the Little Missouri river for the new cutoff of the Northern Pacific main line from near Oakes to Forsythe has been located at the Nitsey ranch buildings. The structure will stand 250 ft. above the river level and will be 5,000 ft. in length.

Cleveland, O.—Chamber of Industries has indorsed the proposal of Mayor Beahr to pass a $2,000,000 high level bridge bond issue. An election will be held Feb. 17.

Dayton, O.—Plans are being prepared by Engineer Cellarius for the construction of the Keowee St. bridge. The structure is to be over 200 ft. in length.

Girard, O.—Petition will soon be presented to the county commissioners asking that a bridge be constructed on Main St., from High St. to the Crandon Lane, and in addition to spanning the river to span the various railroad tracks.

Sandusky, O.—County Surveyor is preparing specifications for the construction of the Huron lift bridge. The bridge will be constructed with concrete arches, and will cost about $75,000.

Portland, Ore.—Port of Portland will hold a special meeting to consider the report of Consulting Engineer Lockwood relative to the proposed Broadway high bridge. The cost of constructing the bridge is estimated at from $1,500,000 to $2,000,000.

Cookeville, Tenn.—Putnam county court has ordered an additional bridge built acros Falling Water river, near the falls, the bridge to be built by Putnam and White counties acting in conjunction.

Decatur, Tenn.—County Commissioners are contemplating on the construction of two bridges.

Sweetwater, Tenn.—County Court of Monroe county has ordered the construction of three county bridges as follows: Over Loco, Natchy and Sinkhole creeks, to cost $4,000.

Dallas, Tex.—Fourteen competitive plans have been submitted to the Dallas County Commissioners for the viaduct which is to be erected at a cost of more than $500,000 between Dallas and the Ninth Ward, Oak Cliff. Plans have been submitted by the following: E. Lee Heidenreich, New York; Daniel B. Luten, Indianapolis; W. G. Kirkpatrick, Jackson, Miss.; H. M. Jones, Nashville, Tenn.; Bartlett & Ranney, San Antonio; W. J. Watson, Cleveland, O.; C. A. P. Turner, Minneapolis, Minn.; Brenneke & Fay, St. Louis, Mo.; James H. Fuertes, New York; Hubbell & Greene, Dallas; I. G. Hedrick, Kansas City; Waddell & Harrington, Kansas City; Concrete Steel Engineering Co., New York.

Ephrata, Wash.—County Commissioners have voted $1,000 for the construction of a bridge across Crab Creek at Warden.

North Yakima, Wash.—County Commissioners have decided to erect a 60 ft. bridge across the Toppenish Creek on the McLeod Road, about two miles from Toppenish.

Tacoma, Wash.—Plans have been received from the Northern Pacific Railway by H. J. McGregor, Commissioner of Public Works, for the steel viaduct on 21st St., from Pacific Ave. to the Union passenger station yards.

Wenatchee Wash. — County Commissioners have decided to erect a new $15,000 steel bridge across the Chelan River on Woodin Ave., at Chelan.

Prairie Du Chien, Wis.—Chicago, Milwaukee & St. Paul Railway will begin the construction of a $1,000,000 bridge over the Mississippi River at this point within a month. The bridge will be built of steel.

Milwaukee, Wis.—City Council has refused to increase from $140,000 to $150,000 the appropriation for a new bridge at Oneida St.

Mexico City, Mex.—Pan-American Railroad will soon receive permission to erect a bridge to extend from the Mexican to Guatemalan territory and across the Suchiate River, connecting Mariscal, Mexico, with Ayntla, Guatemala. The bridge will connect the Pan-American Road with the Oscos Railroad, running from Oscos to Caballo Blanco.

Roads and Streets.

Items Arranged Alphabetically by States.

Auburn, Cal.—Supervisors of Placer County have decided to put the Auburn-Newcastle County Road in first class condition. They will spend in the neighborhood of $2,800, and macadamizing it from one end to the other. Supervisors James Brennan and M. J. Predom, representing the Newcastle and Auburn Districts, will supervise the work.

Marysville, Cal.—Petition has been granted for an extension of Third St., in the town.

Placerville, Cal.—City has been asked by the county surveyors to co-operate with them in the construction of a new county road through the big cut in the Sacramento hill.

San Diego, Cal.—Work will be started early in the spring on a comprehensive system of good roads, which will cost $1,250,000. All the work will be done under the direction of Austin B. Fletcher of Boston, Mass.

Stockton, Cal.—Bids for the construction of the Mossdale Manteca, Hogan and Manteca-Ripon Roads, known as the Manteca Division, to be built from the $2,000,000 bond issue, were rejected by the board of supervisors, and the highway commission was authorized to proceed with the work.

Canon City, Colo.—Surveys have been completed for the construction of the new scenic driveway from Three Mile Springs to the top of the Royal Gorge and on to the crest of the Parkdale Hill, where it will connect with the present Salida Road.

Bridgeport, Conn.—Streets and Sidewalks Committee has filed a requisition of $156,541 with the city auditor, which includes the following. Street grading, $5,000; sidewalks, curb and gutter, grading, $3,000; new cross walks, $5,000; for permanent pavement, Elm St., Main St., Broad St., Broad St. from Elm St. to Fairfield Ave., $7,350; Congress St. from Main St. to Housatonic Ave., $2,740; block pavement, West Housatonic Ave. from Congress St. to North Washington Ave., $4,220; new macadam, $51,950.

Jackson, Ga.—City will hold an election to vote on the issuance of $15,000 worth of road improvement bonds.

Havana, Ill.—Railroad St. is to be paved from the C., P. & St. L. station as far north as Main St., then the improvement will be carried east to the corner of Main and Plum Sts. At this point a turn may be made and the pavements laid around the block bounded by Main, Plum, Market and Orange Sts.

Moline, Ill.—City Council has ordered the board of local improvements to lay 70 blocks of new cement sidewalks. Property owners may lay the walks themselves, awarding their own individual contracts.

Peoria, Ill.—Board of Local Improvements propose to pave Cutler St. with asphalt. Board will also consider two ordinances, one for the paving with brick of Bryan Ave., from Adams St. to Glendale Ave., and Eaton St., from Adams to Water. The paving of Wayne, Irving and North Washington Sts. is also under consideration.

Evansville, Ind.—Grand Ave. will be improved by the Board of Public Works before summer if possible. A petition has been received from the residents on Grand Ave. asking that it be improved.

Fairfield, Ia.—City Council, Jefferson County Supervisors and others have extensive plans for a determined campaign for better roads.

Dighton, Kan.—Lane County Industrial Club has passed a resolution and has appointed a committee to meet with the counties of Greeley, Wichita, Scott, Ness and Rush to discuss the proposed motor car road for Great Bend to the state line of Colorado; the road to pass through Dighton.

Fort Leavenworth, Kan.—Joyce Bros. & Bagwell, and W. A. Wogan, both of Kansas City, Mo., were the lowest bidders for grading approximately 84,000 cu. yds. of earth at this city.

Wichita, Kan.—The township trustees of Delano, Park, Union, Sherman and Greeley Townships will call meetings in the near future to plan a macadam or sand-clay road to extend from Wichita to Denver. As planned the road will be 24 ft. wide if it is made of sand-clay, but if of macadam it will be 14 ft. wide. The cost of the two kinds of roads is estimated at $6,000 per mile for the macadam and $1,000 per mile for the sand-clay. The road will be approximately 277 miles long, from Wichita to the Colorado-Kansas line. C. A. Messer, County Engineer of Sedgwick County, and W. B. Harris, County Engineer of Reno County, are pushing the project.

Annapolis, Md.—State Treasurer M. Vendiver will sell bonds on Feb. 1 in the sum of $1,000,000 for road improvements.

Newburyport, Mass.—City Council has adopted a resolution providing for the appointment of a committee to purchase a road roller at an expense not to exceed $2,500.

Hancock, Mich.—Street Committee has opened negotiations with the Hancock Mining Co., for the supplying of crushed rock which the city officials will use for the making of a system of paved thoroughfares for Hancock's back streets. The streets will be paved with tar macadam.

Duluth, Minn.—County Commissioners have been asked by G. G. Hartley of Duluth to build a five-mile road into Floodwood from the vicinity of Island Farm. The commissioners will probably act favorably upon the matter.

Kansas City, Mo.—Petition for the proposed road from Kansas City to Excelsior Springs is being circulated. The petition has been signed for the first nine miles, from Kansas City to Liberty. Efforts are being made to have the petition signed for the rest of the distance.

St. Joseph, Mo.—Representatives of the water company have petitioned the county court for the macadamizing of what is known as the bottoms road to the water works reservoirs, from the city limits northward a distance of one and three-quarters miles. It is estimated that the improvement will cost about $10,000.

Atlantic City, N. J.—County Board of Freeholders has rescinded the $200,000 contract entered into with Bryant Reilley of this city for the paving of the Shore Road automobile boulevard owing to the dissatisfaction shown by the bidders, who claim that specifications were changed after the letting of the contract.

Canton, O.—Stark County Commissioners state that the improvement of the west Brookfield Road from Massillon to West Brookfield will be started in the spring. The road will be paved on one side, and the other side will remain a dirt road.

Mansfield, O.—City Council has been petitioned by property owners of Sturges Ave. for the paving of that street with asphalt block.

Portland, Ore.—Portland Automobile Club, E. Henry Wemme, President, is back of the movement for the proposed auto road to connect Portland and Hood River.

Portland, Ore.—Riverside Terrace Improvement Club recently held a meeting to discuss hard surface paving and other improvements for South Portland. Interest is taken especially in that part of Portland south of Marquam's Gulch to the city limits. A plan is advocated to make Front St. into a great boulevard, extending from the down town part of Portland south to the city limits.

Philadelphia, Pa.—Ordinances are before the City Council for the paving of the following streets: Twenty-third Ward—Bermuda St., from Orthodox to Tucker St.; Worth St., from Margaret to Bridge St.; James St., from Margaret to Wakeling St.; Wakeling St., from Tacony to Jackson St.; Melrose St., from Orthodox to Duncan St. Thirty-sixth Ward—Cartway of Passyunk Ave., from Schuylkill Ave. to the Schuylkill River. To repave streets—Fifteenth Ward: Perot St., from 24th to 25th St. Twenty-second Ward—Wakefield St., from Coulter to Penn St.; Wakefield St., from Wister to Logan St.; West Hortter St., from Germantown Ave. to Emlen St.

Anaheim, Tex.—A bond election to raise funds for the purpose of paving the intersection of Center St., will be called by the trustees.

Houston, Tex.—Petition has been filed with the city secretary requesting the city to pave Dupree's Alley and Shipman, Crosby and Arthur Sts. with shell or some other material.

Lufkin, Tex.—Representative citizens are circulating a petition for the establishment of four main highways to pierce each section of the county, diverging from Lufkin and touching the border line on each side. The county commissioners will be asked to expend all the money that can be lawfully expended upon these roads.

Orange, Tex.—County Commissioner Martin Schuh has about completed arrangements for the early grading and perfecting of the Newton County Road as far as the Gum Grove School House, four miles north of Orange. This part will be finished right away, and the work prosecuted on to the county line as fast as possible.

San Antonio, Tex.—All the county roads are to be improved either by graveling or retopping.

Sherman, Tex.—A committee has been appointed to organize road improvement district No. 2, to include the City of Sherman and contiguous territory.

Salt Lake City, Utah [illegible] called by Governor Spry, will be held in this city Jan. 26, 27 and 28 for the purpose of adopting a system of road construction particularly adapted to the topographical, climatic and commercial requirements of [illegible] for the states of Idaho, Utah, Wyoming and Colorado.

Norfolk, Va.—City will hold an election for the purpose of voting on the issuance of $75,000 worth of municipal improvement bonds.

Bellingham, Wash.—County Commissioners have been petitioned to build about two miles of county road, just across the river from Maple Falls.

Bellingham, Wash. [illegible] side of the Nocksack Valley below the town of Ferndale have presented a petition to the county commissioners for the rebuilding of the river road, leading from Ferndale down the bank of the river to the Lummi reservation. William Manning is Road Supervisor of the district.

Seattle, Wash.—Petition for the paving of West 59th St., from 24th Ave. northwest to 32d Ave., northwest has been rejected.

Seattle, Wash.—The road from Kent to Orillia is to be surveyed and will probably be put through in the near future. A road also is being surveyed from Kent to Thomas, and this portion of the work will be done in connection with the Kent-Orillia section. The road will go through the western side of Kent.

Spokane, Wash.—City Council has decided to improve Water Ave. from Cedar St. to 100 ft. west of the west line of Ash St., and Cedar St. from Water Ave. to about 140 ft. south of the south line of Water Ave., by grading, curbing, parking and sidewalking.

Milwaukee, Wis.—Viaduct Committee of the county board has passed a resolution to extend the Grand Ave. road from the western end of the viaduct to the county line, making the width 150 ft. the entire distance. It is planned to have the road extended to Madison. The road will be macadamized.

Neenah, Wis.—Residents of Sherry St. have been granted a petition for the paving of that street between Church St. and the Soo line crossing with a concrete pavement.

St. Boniface, Man.—City Council has decided to confer with property owners along Dawson Road and ascertain their views relative to the paving of that road at an estimated cost of $45,000.

Sewers.

Items Arranged Alphabetically by States.

Morrilton, Ark.—Board of Commissioners of Improvement District No. 1, organized for the purpose of constructing a sewer system in this city, is arranging to float the bonds necessary to secure the funds necessary to pay for the work. The cost of the system, it is estimated will be about $21,000.

Winslow, Ariz.—City voted on Jan. 7 on the issuance of bonds for the construction of a new sewer system.

Berkeley, Cal.—City Engineer J. J. Jessup is preparing plans and specifications for improvements to the Berkeley sewer system which will cost about $500,000, and to approve which the voters will decide by a bond issue.

Fresno, Cal.—City is contemplating the construction of a large sewer under Kern St.

Newman, Cal.—Plans for the sewer system for this city have been submitted to Prof. Hyde of the University of California and if he considers the grades and general plans practicable and satisfactory, they will be accepted.

Sacramento, Cal.—City Trustees have decided to submit to the people the proposition of voting $666,000 bonds issue for the erection of a sewage filtration plant for this city.

Visalia, Cal.—City Engineer has been instructed to prepare plans and make estimate of cost of 2,800 lin. ft. of conduit to have minimum capacity of 600 cu. ft. per second to carry Mill Creek through the business portion of the city. Mowe L. Weaver is City Engineer.

Ansonia, Conn.—Plans have been prepared for the construction of sewers on the west side and for extensions on the east side. The work is estimated to cost $200,000. Contracts will be let about Mar. 15, one being for about 1,250 ft. of 45-in. brick sewer for outfall, which will extend through the railroad yards. T. B. Clarke, City Engineer, has charge of the work.

Columbus, Ga.—Alderman Seabrooke, Chairman of the Streets Committee, has urged the City Council to take steps toward the construction of a new sanitary sewerage system.

Dublin, Ga.—City has decided to extend as soon as practicable the sewer system to West Dublin.

Belle Plaine, Ia.—City will soon construct about five miles of sanitary sewers.

Coon Rapids, Ia.—Survey is being made of the town by Frank Jones for the construction of a sewerage system for this town.

Missouri Valley, Ia.—Engineers are at work collecting such information as might be necessary to plan an adequate sewerage system for this town. Experts who have made the preliminary examination have estimated the cost of construction between $17,000 and $25,000.

Oskaloosa, Ia.—City contemplates the construction of a sewage disposal plant and sewer extension at a cost of $50,000 and the extension of the storm sewer system at a cost of $10,000.

Valley Junction, Ia.—Engineering Department of this city has been instructed to make surveys for the proposed sewer, which the city intends to build along the Rock Island tracks to an outlet below the filtering galleries in the Raccoon River.

Bushnell, Ill.—City has purchased an acre of ground west of town and with an acre owned in the east part of town proposes to construct two septic tanks.

Joliet, Ill.—Santa Fe track elevation department has changed its plans relative to reconstruction of sewers under the subways at Cass and Clinton Sts.

Rockford, Ill.—Petitions are in circulation asking the board of local improvements to make a sewer improvement in the first ward. This sewer will be the largest in the city.

Rock Island, Ill.—City Engineer W. E. Treichler has announced the completion of the right of way for the west section of the proposed Seventh Ward sewer system. Preparations are being made to secure the right of way for the east division. Work will be commenced in the spring.

Gary, Ind.—John W. Alford has finished his inspection of the route of the proposed extension of the sewerage system. The new section will connect with the big sewer and extend south across the Pennsylvania Railroad to 25th Ave. and thence west to Main St. The septic tank will probably be located in the southeastern part of the city.

Shelbyville, Ind.—City is contemplating on installing a surface storm sewer to cost from $20,000 to $30,000 immediately after the installation of the sewerage system, which is under construction.

Vincennes, Ind.—City Council has passed a resolution providing for the construction of a sewer system for the city.

Atchison, Kan.—A remonstrance against the construction of a sewer in District N has been granted by the city council. It is probable that the question of a sewer for Northeast Atchison will come up at the spring election.

Lawrence, Kan.—City Council has been recommended to instruct the City Engineer to draw plans, specifications and approximate cost of the construction of a system of storm water sewers for the city.

Topeka, Kan.—City Engineer W. S. Fulton has submitted plans and specifications for sewer district Nos. 29, 30 and 32.

New Orleans, La.—As soon as the remaining $7,000,000 bonds are sold the Napoleon Ave. canal which will extend all the way to station No. 1 at Melpomene and Broad Sts., will be constructed. This drainage system when completed will relieve all that territory lying between Louisiana Ave. and Peters Ave.

Berlin, Md.—Residents of the town are making arrangements to ask the Mayor and City Council for a charter to lay sewer pipes. If this is granted a company will be formed. The refuse will be emptied into the Trap mill pond.

Baltimore, Md.—Specifications for contracts for the Sewerage Commission amounting to more than $350,000 were approved by the Board of Awards. The work covers sanitary contracts and storm water contract No. 9, covering powerhouse, pumphouse, land conduits and under-water discharge conduits at the Back River disposal works and the construction of lateral sewers in sanitary districts 19-B and 35. Chief Engineer Hendricks will soon have ready contracts for an extension of the sanitary intercepting sewer north from above Preston St., running along Jones' falls and passing under the new Union Station. This will be a large concrete sewer, one part 64 ins. and the other 56 ins. in diameter, extending to North Ave., where it branches in three directions. The disposal plant will be arranged so that the flow of the purified sewage from the plant to the river will have sufficient fall to operate turbines, which will run dynamos generating electricity, which will be used for flushing, lighting and pumping.

[illegible]ich.—City Council has declared it necessary to construct a sewer on Court St., and Crown St. from the corner of Fifth and Avon to Court, and on Court from Avon to a point midway between Avon and Thomson Sts., and the construction of a sewer on Fifth Ave., from Mason St. to Smith St.

Cameron, Mo.—City is contemplating on constructing a sewer system.

Carthage, Mo.—City Council has directed City Engineer F. B. Newton to make a survey of the proposed new sewer district to be known as Sewer District No. 9, which would be south of Macon St. and west of Lyon.

Kansas City, Mo.—City Engineer J. L. Darnell has reported to the board of public works that the plans have been completed for the building of Brush Creek sewers from 51st and Mercer Sts. to Brush Creek and Jackson Ave.

St. Joseph, Mo.—Board of Public Works has introduced in the City Council plans and estimates providing for the construction of a sewer in a portion of Sewer District No. 54.

St. Louis, Mo.—Plans have been prepared for the construction of a foul water sewer following the course of the River Des Peres from the river almost to Manchester Ave. The estimated cost is $950,000. Plans have also been completed for the construction of the Baden public sewer at a cost of $419,000, and plans contemplate the South Harlem joint sewer at $432,000 and the Glaise Creek joint district sewer at $260,000.

Springfield, Mo.—City is contemplating on constructing several large district sewers during this year.

Laurel, Mont.—Plans for the sewerage system of this city have been accepted. The plans call for the laying of several miles of sewer pipe and the erection of a sewage disposal station near the Yellowstone River east of the city.

St. Joseph, Mo.—Board of Public Works has recommended an ordinance to the city council providing for the construction of a sewer in District No. 54. A notice was prepared for a sewer in District No. 112.

Havelock, Neb.—City Council has decided to order the construction of a sewer in this city. The main will run west on Jackson St. to the section line, then north to Salt Creek to carry off the sewage for Havelock proper and to tap the Burlington sewer in the northeast part of town to accommodate Norwood Park. The system will cost approximately $25,000.

Margate City, N. J.—City Council has appointed a committee to have plans and specifications prepared for the construction of a sewer system for this city.

Carnarsie, P. O. Brooklyn, N. Y.—Board of Trade has passed a resolution relative to the disposition of sewage. The board insists on immediate and permanent relief from the outrage of emptying raw sewage along the shore of Paerdegat basin by the building of proper and adequate disposal plants, as recommend by the Sewer Department.

Binghamton, N. Y.—City Council intends to construct a storm water sewer on Main st. from Cedar St. to Clarke St.

New York, N. Y.—New sewerage plans calculated to keep New York Harbor free from pollution and to permit the Bronx Valley Sewerage Commission to complete the work now under way, are said to be under consideration by the government authorities at Washington.

Rochester, N. Y.—LeGrand Brown has completed surveys and investigations relative to the matter of sewage disposal and has made his report to the city engineer. The plans recommended is the construction of a sewer in a deep tunnel beginning at the intersection of the Front St. outlet sewer in Central Ave. and intercepting at this point the sewer in Central Ave. and the sewer in Water St., thence extending through Central Ave., under the Genesee River to the intersection of Mill St. in tunnel.

Carrington, N. D.—City is contemplating on constructing a public sewer system to cost $75,000. The sewage is to be disposed of by the septic tank method.

Mandan, N. D.—Acting City Engineer Ray Wickham has been given the contract for the preparation of plans and specifications for the new sewerage system that will be constructed in this city. The system will be along the lines of a natural drainage system, the Missouri River being the outlet.

Dayton, O.—City Council passed an ordinance providing for the issuance of $2,000 worth of bonds for the construction of a storm water sewer on Glendale Ave. and Oxford Ave.

Dayton, O.—Plans, specifications and estimates for the sanitary sewers in part of Sewer District Nos. 8 and 9.

Dayton, O.—Petition is being signed by property owners in the neighborhood of Second St., from Perry to St. Marys, which will be presented to the City Council asking for the construction of a storm water sewer.

Mansfield, O.—Petition has been signed by property owners on Hanmond Ave., asking that an 8-in. sanitary sewer be built on that thoroughfare.

Springfield, O.—City contemplates on expending $20,000 during the year toward keeping up 44 miles of streets, and is considing the purchase of a new road roller at a cost of $2,700.

Youngstown, O.—City Council has declared it necessary to construct sewers in portions of the following streets: Garlick, Buckeye, Frederick and McHenry.

Mountain View, Okla.—Engineers are drawing plans and specifications and estimate the cost of constructing a sewer system.

Klamath Falls, Ore.—City Council has adopted the plans and specifications for the sewer system for this city. The main sewer will be on Main St., and a septic tank will be installed. Bids for the work will be advertised for soon.

Portland, Ore.—Surveys have been made for a sewer on East 45th St., between Belmont and East Stark Sts.

Portland, Ore.—Stephen Slough District, which begins at Division, near East Grant St., and covers the territory not provided for by the Brooklyn sewer south, and the Sunnyside system on the north side has been formed. The cost of the system is estimated at $18,431.

Salem, Ore.—City Engineer and the Sewer Committee have outlined a plan for the construction of a sewer system in South Salem. It will probably be constructed in that portion lying west of High St., down High St. to Mission, from Mission to Bellevue, thence following South Mill Creek to the Williamette Slough and along Williamette Slough to the outlet below Ferry St.

The Dalles, Ore.—This city is contemplating a new sewer system, and the erection of a crematory or garbage disposal plant. L. T. Boyle is City Engineer.

Altoona, Pa.—City Engineer Franz Engstrom is stated to have started surveying the district from First St. over into Pleasant Valley to determine whether there is enough fall to enable the city to erect a sewage disposal plant at that place. It is planned to run a tunnel through the hill along the eastern line of the city to carry the sewage down into Pleasant Valley.

Jenkintown, Pa.—Dr. Samuel G. Dixon of the State Department of Health, has urged this city to act at once in behalf of a system of intercepting sewerage and sewage disposal.

Parsons, Pa.—City Council has passed an ordinance which authorizes an increase in the bonded indebtedness of this borough in the sum of $50,000 for the installation of a sewerage system.

Philadelphia, Pa.—Bids are before the City Council for the construction of sewers in the following streets: Rising Sun Ave. from Clarkson to Tabor St.; De Lancey St. from 59th to 60th St.; Pine St. from 58th to 59th St.; Addison St. from 57th to 58th St.; Osage Ave. from 57th to 58th St.

Williamsport, Pa.—City Solicitor Cummings has advised the expenditure of the amount called for by the ordinance authorizing the employment of Engineer Congelton to prepare the plans for the construction of a sewage disposal plant.

Florence, S. C.—City Council will soon order the issuance of bonds for the construction of a sewer in this city.

Brownsville, Tex.—City has granted a charter to the Brownsville Sewerage Co. to construct a system of sewers throughout the city and all property owners are required to make connections with it. The capital stock of the company all paid up, is $30,000.

Kennewick, Wash.—City is contemplating on installing a sewer system before next summer. The city clerk will soon engage an engineer to prepare plans and estimates.

Hoquiam, Wash.—Plans for the sewer system for this city have been completed by City Engineer Moughmar and have been submitted to City Engineer Thompson of Seattle for report. The trunk sewer will run along K St., and will cost about $200,000 to build.

Spokane, Wash.—City Council has decided to improve Water Ave. from Cedar St. to 100 ft. west of the west line of Ash St., and Cedar St. from Water Ave. to about 140 ft. south of the south line of Water Ave., by constructing a sewer.

Corliss, Wis.—Plans and specifications have been prepared by W. S. Shields Engineering Co., Chicago, Ill., for a proposed sewer system. A. G. Cady is Village Clerk.

Nanaimo, B. C.—City Council has passed a bylaw to provide $100,000 for a sewerage system.

St. Boniface, Man.—The St. Boniface Union Stock Markets Co. has asked the City Council to construct the proposed trunk sewer, which is to be built from the new stock yards to the Red River at an estimated cost of over $200,000

Kincardine, Ont.—Provincial Board of Health has approved the plans for the sewage system and disposal plant for this city.

New Liskeard, Ont.—Plans for the sewage system and disposal plant for this city have been approved by the Provincial Board of Health.

Nipegon, Ont.—Plans for the sewage system and disposal plant for this city have been approved by the Provincial Board of Health.

Oshawa, Ont.—Provincial Board of Health has approved the plans for the sewage system and disposal plant for this city.

Water Supply.

Items Arranged Alphabetically by States.

Bessemer, Ala.—Mayor I. A. Lewis has vetoed the resolution passed by the city council providing for the purchase of the water works of this city.

Pratt City, Ala.—The Birmingham Water Co. of Birmingham, Ala., is to purchase the water works system of Pratt City at a cost of $25,000. The company plans to run a big main to connect with the Ensley main at Tuxedo Park and furnish the supply direct from Birmingham, cuting the old Pratt City plant.

Texarkana, Ark.—City recently voted a bond issue of $200,000 for a municipal water works plant.

Pasadena, Cal.—An election is to be held Jan. 26 for the purpose of voting bonds amounting to $1,200,000 for the purchase of the water works system.

San Rafael, Cal.—Preliminary steps are under way by San Rafael, San Anselmo, Larkspur, Ross, Kentfield, Corte Madero, Sausalito and Mill Valley for the formation of a water district to include those towns. The scheme, which will, it is estimated, involve a bond issue of $1,550,000, will be carried out during the year of 1910.

Spring Valley, Cal.—Board of Directors of the Spring Valley Water Works has voted to offer the plant to the city for $35,000,000.

Longmont, Colo.—At a recent election it was voted to install a new adequate water system for this place.

South Canon, Colo.—City has entered into an arrangement with G. R. Gwillim of Canon City, for the construction of a system of water works. The water will be piped from three artesian wells at Chandler, seven miles south of this city. The work includes the construction of a reservoir. Thomas Pease of Colorado Springs is said to be interested. The cost of installing the system will approximate $50,000.

Clinton, Ia.—The Chicago & Northwestern Railway Co. is planning the construction of a new pumping plant between Sixth and Marquette Sts., involving the installation of an extensive filtration system. The pumping plant will take the water from the well to the company's mains.

Corydon, Ia.—An election is to be held here to vote on the issuance of $40,000 worth of water works bonds.

Waterloo, Ia.—City has voted the issuance of $525,000 worth of bonds for the purchase of the local water works. N. W. Harris & Co., Chicago, Ill., offered to take over the wafer plant at $362,000, the balance of the sum raised from the bond sale to be used in extensions.

Aurora, Ill.—An appropriation of $8,000 has been granted for the construction of an additional well at the city pumping station. Although nothing definite has yet been accomplished the matter will probably be taken up at an early meeting of the Board of Public Works. Theodore D. Stinson is Superintendent of the Water Department.

Chicago Heights, Ill.—Plans have been prepared by the Stephens Engineering Co. of Chicago for the installation of deep well pumps direct driven by motors at the water works plant. The work will require an expenditure of about $30,000.

Chicago, Ill.—The Board of Trustees of the Sanitary District are considering the installation of electrical pumps for the pumping stations instead of the steam ones now in use. The power could be supplied by the Sanitary District.

Macomb, Ill.—Committee of City Officials have inspected the water works system of Decatur, Ill., in view of installing a similar system at Macomb. About $40,000 is available for the improvement.

Newman, Ill.—Citizens are advocating the installation of a water works system at this place.

Rockdale, P. O. Joliet, Ill.—Plan is being promoted by the mayor for the installation of a water works system. Joliet capitalists are said to be interested.

Tilton, Ill.—Danville Water Co. has asked the commissioners of Catlin Township to grant them a franchise to extend its main from Tilton to the county farm.

Ashland, Kan.—Plans and specifications are being prepared for a water and light system at this place, and bids for the work will probably be called for early in February. J. S. Worley Co., 206-7 Reliance Bldg., Kansas City, Mo., are the Engineers.

Assaria, Kan.—Blue prints and estimates have been prepared for a water plant sufficient for this city and it is expected that something definite will be done by Summer.

Dodge City, Kan.—Plans and specifications are being prepared for the construction of a water works system for this city. J. S Worley Co., 206-7 Reliance Bldg., Kansas City, Mo., are the Engineers.

Osage City, Kan.—City is contemplating on the construction of a sewer system early in the spring. Secretary Crumbine of the State Board of Health recently addressed a mass meeting and urged the improvement.

Crowley, La.—Consulting Engineer Walter B. Reid of New Orleans has presented to the city council a comprehensive set of plans and specifications for a new system of water works to replace the temporary plant now in operation.

Brainerd, Minn.—City has taken over the system of the Minnesota Water Works Company, and has placed it under control of the Water and Light Board. The cost of the plant was $57,500.

Aurora, Mo.—Citizens have voted not to grant the Lawrence County Water & Light Co. another 20 year franchise and a contract for 10 years to furnish water and lights. The people are not in favor of Municipal Owneship, but are disposed to offer a franchise and contract to a new corporation at reasonable prices and terms. The opposition is lead by Mr. John A. Williams, a local engineer, who will answer inquiries from persons interested.

Kirksville, Mo.—Bonds amounting to $10,000 have been voted to improve the water works system of this place.

Beatrice, Neb.—Plans are under way for the construction of a water works system for this place and the question of voting bonds for the purpose is before the council.

Havelock, Neb.—City Council has decided to install an independent water system and pumping station. The improvement as proposed is estimated to cost about $50,000.

North Platte, Neb.—The Union Pacific are to take immediate steps toward securing a good supply of water at this place. The drilling of a 5,000 ft. artesian well, estimated to cost $15,000 or the construction of a pipe line from White House Creek is under consideration.

Peru, Neb.—At a recent election it was voted not to issue bonds for the water works system.

Fargo, N. D.—Citizens will vote on Jan. 28 on the proposition of bonding the city in the sum of $65,000 for the purpose of building a filtration plant and new water works.

Albion, N. Y.—An appropriation of $2,500 for making test borings for the proposed municipal water works system for this village is to be voted on.

Fort Erie, P. O. Buffalo, N. Y.—Village Council favors the installation of a water works system. J. J. Foster is chairman.

Newark, N. Y.—The Municipal Board proposes increasing the water supply by drilling several wells in the north end of the city.

Niles, O.—City has sold $1,500 worth of water works extension bonds. Plans are being made for further extension of water pipes on new streets.

Warren, O.—Citizens will soon vote on the issuance of $250,000 worth of bonds to build a water works system.

Ardmore, Okla.—J. W. Maxey Engineering Co. of Houston, Tex., has been employed to make estimates on a water power plant on the Washita River.

Durant, Okla.—City Clerk W. S. Shannon will sell water works bonds in the sum of $10,000 on Jan. 18.

Mountain View, Okla.—Engineers have started work of running the preliminary lines for an extension to the water works system.

Portland, Ore.—Plans are being prepared for the construction of a new water main pipe line capable of delivering into the reservoirs 45,000,000 gals. per 24 hours, in addition to that now delivered, with the intention of placing the work under construction early in 1910.

Shenandoah, Pa.—Plans and specifications for the new reservoir have been presented to the city council by Surveyor Geary. The estimated cost is from $39,000 to $41,000.

Knoxville, Tenn.—The Knoxville Water Commission has ordered the extension of six water mains, five of which are in Knoxville and the other in Park City.

Midland, Tex.—Mayor J. A. Haley will sell $50,000 worth of semi-annual water works bonds on Feb. 15, 1910.

Gunnison, Utah.—City is soon to hold an election to vote on the issuance of bonds for the installation of a water works system.

Martinsburg, W. Va.—City has issued bonds in the extent of $40,000 for the extension of the water works system.

Hollister, Wash.—The Hollister Water Works Co. has been incorporated with a capital stock of $10,000. The incorporators are, William S. Kuhn, D. C. McWatters, V. B. McCain, Harve W. Hurlebaus and Mervin J. Kirkpatrick.

Oshkosh, Wis.—Committee of 12 with himself as chairman has been appointed by Mayor Voss for the purpose of investigating the proposition of purchasing the plant and system of the Oshkosh Water Works Co., and operating it as a city plant.

Guernsey, Wyo.—T. A. Kinck, Town Clerk, will sell Jan. 22, 1910, $20,000 worth of water works bonds.

WATER-WORKS BONDS.

Mount Pleasant, Tenn.

Bids will be received by the Mayor and Board of Aldermen of Mount Pleasant, Tenn., until 8 o'clock p. m., on Tuesday, February 1, 1910, for the purchase of $55,000 thirty-year six per cent (6%) water works improvement bonds for the construction of a gravity system of water works for the town of Mt. Pleasant. For further information address Dr. J. E. Anderson, Chmn., Mt. Pleasant, Tenn. The right is reserved to reject all bids.

W. H. LONG, Mayor.
F. M. RICKETTS, Recorder.

PUMPING STATION.

DES MOINES COUNTY DRAINAGE DISTRICT NO. 1.

Burlington, Iowa.

Sealed bids will be received by the Supervisors of Des Moines County at Burlington, Iowa, until 2 o'clock p. m., February 2d, for furnishing and erecting a complete pumping station including the buildings and machinery. A considerable portion of the building materials will have been delivered at the pumping station site.

The pumping plant will be used for drainage of agricultural lands; shall have a capacity of 525 cubic feet per second against a head of 12½ feet exclusive of friction.

The plant will consist of two or three centrifugal pumps each direct connected to a cross or tandem compound condensing Corliss or four-valve steam engine; three water tube boilers for a working pressure of 150 lbs. per square inch, equipped with superheaters for a maximum working temperature of 475°; one small vertical auxiliary boiler for working pressure of 100 lbs.; shaking grates; induced draft; duplicate feed water system; open heater; electric lighting system for the plant and a coal tramway electrically operated.

For further information, plans and specifications address the HARMAN ENGINEERING CO., 120 Fredonia Ave., Peoria, Ill.

WATER-WORKS AND SEWER

Weatherford, Okla.

The City of Weatherford, Okla., will receive sealed bids until Friday, Jan. 28, 1910, at 2 p. m., for the construction of a concrete septic tank of about 84,000 gallons capacity, two sand filter beds 60'x 100'x3'-3", 32,450' of 6", 9,400' of 8", 7,770' of 10", 4,770' of 12", 1,450' of sewers of the first quality pipe, together with manholes, lampholes and other appurtenances.

Also the construction of a water works standpipe 24' diam. by 40' high, one 18'x 72" high pressure boiler, return tubular, full flush front, an air lift pumping system for five wells, one duplex force pump of about 900,000 gallons capacity, 36,000' of different size water mains with valves, hydrants, etc., etc.

All bids must be accompanied by a certified check for approximately 5% of the bid, made payable without reserve to the City Treasurer, Weatherford, Okla. Bids must be made on blanks furnished by the city and addressed to Mayor J. J. Winne, Weatherford, Okla., and must be marked plainly with the words, "Proposal for Sewerage," or "Proposal for Extension of Water Works System," as the case may be, as the bids will be taken up and considered separately.

Plans and specifications are on file with and blanks may be obtained from W. K. Cunningham, City Clerk, Weatherford, Okla., or J. L. O'Hearn, Consulting Civil Engineer, Clinton, Okla.

The city reserves the right to reject any and all bids and to accept any bid.

W. K. CUNNINGHAM,
City Clerk, Weatherford, Okla.

CAST-IRON PIPES.

Bangkok, Siam, Jan. 6, 1910.

The Minister of Local Government, Bangkok, Siam, is prepared to receive tenders for the Supply of Cast Iron Pipes and accessories for the water supply of the City of Bangkok.

Specifications with forms of tender and contract may be obtained on application to Secretary of the Siamese Legation, Washington, D. C., on payment of $1.25.

CEMENT BRIDGES AND CULVERTS.

Montezuma, Iowa.

The Board of Supervisors of Poweshiek County, Iowa, will meet at their room in the Court House at Montezuma, Iowa, Feb. 23, 1910, to let the contract for building cement bridges and culverts in Poweshiek County for the year 1910.

The Board wishes those interested in that kind of work to meet with them on that date.

J. W. ROSE,
County Auditor.

SEWER SYSTEM.

Traer, Iowa.

Bids will be received until January 28, 1910, by T. F. Stokes, City Clerk, for constructing a sanitary sewer system, consisting of 13,294 feet of 6, 8, 10, 12, and 15-inch pipe, 27 manholes, 4 drop manholes, 4 flush tanks, 1 septic tank and bulkhead.

POSITIONS WANTED

Card is under this heading cost only

One Cent a Word

Count 6 words for address.

WANTED—POSITION as superintendent of company manufacturing cement blocks or sewer pipe. Have had experience in the manufacturing of building blocks, sewer pipe and ornamental cement work. Also experienced in sidewalk, curb and gutter, and culvert work. Address Box 235, care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 3-1t

WANTED—POSITION with company laying underground cable conduit. Am 31 years old. Have executive and managing experience. Capable, reliable; best of references. Address Box 237, care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 3-4t

WANTED—POSITION—Contractors' superintendent and engineer (34) with ten years' experience in building bridges, tunnels and all kinds of massive and reinforced concrete construction, location and grading for electric and steam railroads; able to organize and handle large forces. Open for immediate employment. Address Box 238, care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 3-1t

WANTED—POSITION with contractor doing reinforced concrete or drainage work by young engineer, aged 23. Six years' general experience. Can go at once. Address E. L. B., care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 3-3t

WANTED—POSITION—Associate A. S. M. E. desires position. Experienced in design and construction of buildings and mechanical equipment. Competent executive in field or drafting room. Address Box 239, care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 3-1t

WANTED—POSITION with engineering or contracting company. Experienced in compressed air tunneling, miscellaneous concrete and steel erection, railroad and city surveying, land development, drafting, computing, etc. Address A. C., care of Engineering-Contracting, 13 Park Row, New York City. 3-1t

WANTED—POSITION in North or West by engineer. Seven years' experience. Five years of it on railroad work, doing location, construction and maintenance. At present engaged on levee proposition. Ready to make change any time after Feb. 1. 28 years of age. Address Box 232, care of Engineering-Contracting, 355 Dearborn St., Chicago. 2-4t

WANTED—POSITION by boom derrick man. Thoroughly familiar with this class of work. Fourteen years' experience. Best of references. Will go anywhere. Address Box 222, care of Engineering-Contracting, 355 Dearborn St., Chicago.

WANTED—POSITION as dredge engineer. Will go any place. Can give references. Address Lock Box 305, St. Cloud, Minn. 2-2t

WANTED — POSITION — By experienced timekeeper. Will go anywhere. Address H. C., care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 2-3t

WANTED — POSITION — Civil engineering graduate now engaged in technical journalism desires similar position or one in publicity work with commercial house. Fluent writer; good technical education and experience; executive ability. Address Box 234, care of Engineering-Contracting, 355 Dearborn St., Chicago. 2-2t

WANTED—POSITION as office engineer with large engineering or contracting firm. Position to be permanent. Correspondence solicited. Address "East," care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 2-4t

If You Desire a Position

TO LET—About 30,000 yards grader and wheeler work; short hauls and nice work; seventeen cents, with one cent overhaul after five hundred feet. Ware & Spencer, Bosworth, Mo. 3 tf

WANTED—I am in the market for a good secondhand road grading outfit, including scrapers, dump wagons, slips, etc. Address H. L. Miles, Contractor, Wichita, Kan. 2-2t

WANTED—PARTNER with ten thousand cash and fifteen thousand at command to purchase half interest in an established general contracting business. Correspondence invited. Address Box 233, care of Engineering-Contracting, 355 Dearborn St., Chicago. 2-4t

We have fresno, wheeler and grader work to let on the following lines in North Dakota: 66 miles on the C., M. & St. P. Ry.; 40 miles on the N. P. Ry. Free transportation for outfits, teams and men over the above lines. Address E. A. Wickham & Co., Council Bluffs, Ia. 2-3t

We have 150 miles of fine grader, fresno and wheeler work to let on the C. & N. W. Ry. in South Dakota. This is fine work in a good country. We can use both small and large outfits. Free transportation for teams, outfits and men over the C. & N. W. Ry.
E. A. Wickham & Co., Council Bluffs, Ia.
Roberts Bros. & Wickham, 123-125 La Salle St., Chicago. 2-3t

WOULD LIKE to get the address of A. J. Vanhoy. Write J. W. Sikes, Seymour, Tex.

WANTED—An experienced railroad man to take from $5,000 to $10,000 stock in an incorporated company and act as superintendent with salary. Address P., care of Engineering-Contracting, 355 Dearborn St., Chicago. 1-4t

STONE QUARRY—Want to contract with responsible party to take out rubble and crushed stone. Quarry opened up and plant installed. Must let contract by Jan. 15, 1910. Carothers Contracting Co., Lake Altoona, R. F. D. No. 2, Altoona, Pa.

WANTED—100 additional teams about March 1st for full year's work. Double tracking on Norfolk & Western Ry. Address J. S. Slone, Kingston, Ross County, Ohio. 1-4t

WANTED—Have machine outfit of eighteen teams and desire early spring work. Address B. A. Carder, Mott, N. D.

OPPORTUNITY to buy controlling interest in drainage and construction company having several lucrative contracts and several machines at work. Good reasons for selling. Address "Contractor," care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 26-4t

Practical Cement Testing

By W. PURVES TAYLOR, M. S. C. E.
Engineer in Charge of Philadelphia Municipal Testing Laboratories.

THIS is the first practical and exhaustive treatise on this important subject. It has already been adopted as a text book by leading technical schools.

Each chapter contains a minute description of the methods followed in the author's laboratory and many valuable suggestions as to the "how" and "why" of cement testing. The observations on the interpretation of results, one of the most difficult tasks of the novice, are especially pertinent and are expressed in a fair and conservative manner.

The book is so complete that it can be put in the hands of a young engineer with confidence that it will enable him to make reliable tests on cement. The wealth of photographs and line cuts furnish the pictorial examples of how to conduct cement tests, and the 300 pages of texts are so explicit that even the most inexperienced man can soon learn the art of cement testing. Yet the book has not a superfluous paragraph.

Cloth, 6x9 inches; 330 pages; 142 illustrations; 58 tables; $3.00 net, postpaid.

The Myron C. Clark Publishing Co.
355 Dearborn Street, CHICAGO, ILL.
13-21 Park Row, NEW YORK

REFUSE INCINERATOR, STEEL STACK AND SEWAGE PUMPING STATION EQUIPMENT.

El Paso, Texas, January 1, 1910.

Sealed proposals for furnishing all labor and materials for the construction and erection of a refuse incinerator, steel stack and sewage pumping station equipment, with appurtenances, in the city of El Paso, Texas, will be received by the City Clerk at his office at the City Hall, El Paso, Texas, until 12 o'clock noon, standard time, Thursday, February 3, 1910, in accordance with the plans and specifications on file at the office of the City Engineer of the city of El Paso, Texas, from whom copies may be obtained on payment of $10. Plans and specifications may also be seen at the office of Hering & Fuller, Consulting Engineers, 170 Broadway, New York, N. Y.

The equipment to be installed consists of one three grate top charged incinerator of a capacity of 48 tons of wet weather refuse per 24 hours, two horizontal 125 horse power water tube boilers, two direct connected engine driven direct current 65 K. W. generating sets, three direct connected motor driven vertical centrifugal pumping units each of a capacity of 2 million gallons per 24 hours, one one-ton three-motor electric traveling crane, one self supporting steel stack 4 feet 6 inches in internal diameter and 70 feet high above the base, a four ton platform wagon scale, a ventilating apparatus, a pre-heater for the incinerator, together with the necessary refuse boxes, flues, tools, instruments, valves, pipes, wires and other appurtenances.

Proposals shall be made on the blank forms to be obtained from the City Engineer, and shall be sealed and filed with City Clerk before the hour above stated, when they will be opened by him and publicly read in the Council Chamber in the City Hall.

All proposals will be considered informal and rejected which contain bids not asked for, or which do not contain prices in words and figures for all items given in the Form of Proposal, or which otherwise are not in conformity with this notice.

Each proposal shall contain the full name of every person, firm or corporation interested in the same and the address of the person, firm or corporation and secretary of the corporation bidding, and shall be accompanied by a certified check upon a national bank drawn to the Treasurer of the city of El Paso in the sum of Five Thousand ($5,000) Dollars.

The bidder to whom the contract may be awarded shall attend at the office of the City Clerk with the sureties offered by him (or them) within 12 days (Sundays excepted) after the date of the notification by the city of the acceptance of his or their proposal and there sign the contract in triplicate for the work. In case of the failure so to do he or they will be considered as having abandoned the same and the certified check accompanying his proposal shall be forfeited to the city.

The checks of all unsuccessful bidders will be returned upon demand and also the check of the successful bidder upon the execution of the contract and the furnishing of the required bond.

A bond in the sum of twenty-five (25) per cent of the amount of the contract with sureties satisfactory to the City Council will be required for the faithful performance of the work.

The refuse to be burned will be a mixture of vegetable and animal matter, bones, paper, rubbish, cans, bottles, ash, dust, floor sweepings, manure, dead animal and street sweepings, as these constituents are defined in Article II of the contract.

No tests have been made to ascertain the calorific value of the refuse. The bidder must make for himself such investigations as he may deem necessary and after he has made his proposal to the city of El Paso he shall not make any claims or complaints as to the character of the refuse because of any failure on his part to properly fulfill the specifications and required guarantees. It may be stated, however, that at the present time refuse is commonly burned on the dump or in piles in the back yards of the houses. On account of the dry climate, evaporation of water from the refuse is rapid.

Each bidder shall furnish all of the drawings, specifications and statements called for under this contract and they shall accompany and form a part of his proposal to the city of El Paso.

All bids will be compared on the basis of the Engineer's estimate of the work to be done as outlined in the five items given below:

Item.

I. Furnace, combustion chamber, preheater, refuse boxes, tools, flues, instruments, duplicate materials and tests. Lump sum.

II. Generators, motors, pumps, valves, piping, ventilating apparatus and tests. Lump sum.

III. Electric crane, platform scales, float gage and tests. Lump sum.

IV. Boilers, feed pumps, feed water heater and steam piping. Lump sum.

V. Self supporting steel stack and foundations. Lump sum.

The quantities in these items are not given in detail and are only to serve as the basis of a uniform comparison of bids. The City Council reserves the right to increase or decrease the amount of any class or portion of the work as may be deemed necessary and according to the specifications and contract.

The City Council reserves the right to reject any or all bids.

PERCY M'GEE,
City Clerk.

F. H. Todd,
City Engineer.

CONSTRUCTION OF REFUSE INCINERATING AND SEWAGE PUMPING STATION, FORCE-MAIN AND SEWAGE DISPOSAL WORKS.

El Paso, Tex., January 1, 1910.

Sealed proposals for furnishing all labor and materials for the construction of a refuse incinerating and sewage pumping station, force-main and sewage disposal works, with appurtenances, but not including furnaces, pumps and machinery, in the city of El Paso, Texas, will be received by City Clerk of said city at his office at the City Hall, El Paso, Texas, until 12 o'clock noon, standard time, February 3, 1910, in accordance with the plans and specifications on file at the office of the City Engineer of the city of El Paso, Texas, from whom copies may be obtained on payment of $10. Plans and specifications may also be seen at the office of Hering & Fuller, Consulting Engineers, 170 Broadway, New York, N. Y.

Proposals shall be made on the blank form to be obtained from the City Engineer, and shall be sealed and filed with the City Clerk before the hour above stated, when they will be by him opened and publicly read in the Council Chamber in said City Hall.

All proposals will be considered informal and rejected which contain bids not asked for, or which do not contain prices in words and figures for all items given in the Form for Bids, or which otherwise are not in conformity with this notice.

Each proposal shall contain the full name of every person, firm or corporation interested in the same and the address of the person, firm or corporation and secretary of the corporation bidding, and shall be accompanied by a certified check upon a national bank drawn to the Treasurer of the city of El Paso in the sum of Five Thousand ($5,000) Dollars.

The bidder to whom the contract may be awarded shall attend at the office of the City Clerk with the sureties offered by him (or them) within twelve days (Sundays excepted) after the date of the notification by the city of the acceptance of his or their proposal and there sign the contract in triplicate for the work. In case of the failure so to do he or they will be considered as having abandoned the same, and the certified check accompanying his proposal shall be forfeited to the city.

The checks of all unsuccessful bidders will be returned upon demand and also the check of the successful bidder upon the execution of the contract and the furnishing of the required bond.

A bond in the sum of twenty-five (25) per cent of the amount of the contract with sureties satisfactory to the City Council will be required for the faithful performance of the work.

All bids will be compared on the basis of the Engineer's estimate of work to be done, as follows:

Item.

1. Earth excavation at site of incinerating and pumping station.2,770 cu. yds.
2. Earth excavation for force-main and disposal works.....5,800 cu. yds.
3. Rolled embankment.....6,700 cu. yds.
4. Rock excavation.....50 cu. yds.
5. Seeding.....1 acre
6. Roadways and walkways.....
7. 24-inch force-main and main distributor exclusive of trench...2,850 lin. ft.
8. 30-inch cement pipe exclusive of trench.....120 lin. ft.
9. 24-inch cement pipe exclusive of trench.....395 lin. ft.
10. 18-inch cement pipe exclusive of trench..... 45 lin. ft.
11. 14-inch cement pipe exclusive of trench.....250 lin. ft.
12. 12-inch cement pipe exclusive of trench..... 44 lin. ft.
13. 8-inch cement pipe exclusive of trench.....640 lin. ft.
14. 4-inch cement pipe exclusive of trench..... 10 lin. ft.
15. Gate valves and shear valves..... .....lump sum.
16. Concrete—1:2½:5—in sprinkling filter (except slabs), settling basin, manholes, foundations to laboratory and other concrete of similar nature required.....1,425 cu. yds.
17. Concrete—1:2:4—in foundations, walls, columns and floors in the incinerator and pumping station building below the top of the incinerator floor..... .....625 cu. yds.
18. Concrete—1:2:4—in sedimentation tank and concrete slabs over the main and lateral collectors of filter..... .....202 cu. yds.
19. Steel reinforcement....41,450 pounds.
20. Lateral distributors.....lump sum.
21. Risers.....lump sum.
22. Nozzles.....lump sum.
23. Dosing Apparatus.....lump sum.
24. Miscellaneous wrought iron and steel work.....10,000 pounds.
25. Miscellaneous cast iron work..... .....3,000 pounds.
26. Wooden appurtenances.1.2 M. ft. B. M.
27. Laboratory.....lump sum.
28. Superstructure of incinerating and pumping station.....lump sum.

These quantities are approximate, being given only as a uniform basis for comparison of bids, and the City Council reserves the right to increase or decrease the amount of any class or portion of the work as may be deemed necessary and as specified.

The City Council reserves the right to reject any or all bids.

PERCY M'GHEE,
City Clerk.

F. H. Todd,
City Engineer.

CONSTRUCTION OF SEWAGE POWER HOUSE, CONDUITS, PUMP HOUSE, LATERAL SEWERS, ETC.

Baltimore, Md.

SEALED PROPOSALS, indorsed "Proposal for Constructing Power House, Pump House and Land Conduits, Sanitary Contract No. 46"; "Proposal for Constructing Underwater Discharge Conduits, Sanitary Contract No. 47"; "Proposal for Constructing Lateral Sewers in District No. 19B, Sanitary Contract No. 48"; "Proposal for Constructing Sanitary Sewers in Lateral District No. 35, Sanitary Contract No. 49"; "Proposal for Building Storm-Water Drains, Contract No. 9"; addressed to the Board of Awards of Baltimore city, will be received at the office of Mr. J. Sewell Thomas, City Register, City Hall, Baltimore, Md., until 11 a. m., Wednesday, February 9, 1910, for constructing power house, pump house and land conduits and underwater discharge conduits at the Back River Disposal Works, sanitary lateral sewers in Districts 19B and 35, and storm-water drains, Contract No. 9, as shown on plans on file in the office of Mr. Calvin W. Hendrick, Chief Engineer of the Sewerage Commission.

Specifications and plans can be obtained upon application at the office of the Sewerage Commission, Room 904, American Building, Baltimore, Md., on and after Monday, January 17, 1910. The following charges will be made for each specification and blue prints:

Power house, pump house and land conduits, Sanitary Contract No. 46.$5.00
Underwater discharge conduits, Sanitary Contract No. 47..... 5.00
Lateral sewers in District No. 19B, Sanitary Contract No. 48..... 5.00
Lateral sewers in District No. 35, Sanitary Contract No. 49..... 5.00
Storm-water drains, Storm-Water Contract No. 9..... 5.00

These charges will be refunded upon the return, on or before February 9, 1910, of the unused specifications and plans in good condition, or upon the return of the general specifications, if any, and plans, in case a bid is submitted.

A certified check of the bidder, for the respective amounts shown below, on a clearing house bank, made payable to the order of the Mayor and City Council of Baltimore, will be required to be deposited with each bid:

	Amount of Check.
Power house, pump house and land conduits, Sanitary Contract No. 46.....	$3,500.00
Underwater discharge conduits, Sanitary Contract No. 47.....	2,500.00
Lateral sewers in District No. 19B, Sanitary Contract No. 48.	3,000.00
Lateral sewers in District No. 35, Sanitary Contract No. 49.....	1,500.00
Storm-water drains, Storm-Water Contract No. 9.....	3,500.00

Approximate quantities:

Power House, Pump House and Land Conduits, Sanitary Contract No. 46.
4,200 cu. yds. excavation and refill for power house, etc.
1,535 lin. ft. excavation and refill for conduits.
35 M. ft., B. M., lumber in foundations.
75 M. ft., B. M., ordinary shoring, sheeting and bracing left in place.
2,000 lin. ft. underdrains, 4 to 10 inches diameter.
3,560 cu. yds. concrete masonry.
1,500 lin. ft. reinforced concrete piles.
425,000 pounds reinforcing steel.

Underwater Discharge Conduits, Sanitary Contract No. 47.
5,125 linear feet wooden piles.
100 3"x12" wooden caps.
5,030 linear feet 60" diameter wood stave pipe.
5,000 pounds 1" diam. galvanized steel conduit stirrups.
2 special discharge elbows.

Lateral Sewers in District No. 19B, Sanitary Contract No. 48.
36,000 lin. ft. vitrified pipe sewer, 8" to 20" diam.
17,500 lin. ft. 6-inch house connections.

Lateral Sewers in District No. 35, Sanitary Contract No. 49.
10,000 lin. ft. vitrified pipe sewer, 8" diam.
5,000 lin. ft. 6-inch house connections.

Storm-Water Drains, Storm-Water Contract No. 9.
1,235 lin. ft. 72-inch circular drain.
1,910 lin. ft. 69-inch circular drain.
55 lin. ft. 57-inch circular drain.
35 lin. ft. 48-inch circular drain.
40 lin. ft. 42-inch circular drain.
625 lin. ft. 33-inch circular drain.
364 lin. ft. 30-inch circular drain.
2,281 lin. ft. 24-inch circular drain.
1,670 lin. ft. 20-inch circular drain.
1,402 lin. ft. 18-inch circular drain.
1,036 lin. ft. 15-inch circular drain.
380 lin. ft. 12-inch circular drain.
62 manholes.
3 Drop-wells.
3,372 lin. ft. inlet connections, 12" to 18".
3 bellmouths.
128 inlets.
100 M. ft., B. M., sheeting.
10 M. ft., B. M., lumber in foundations.

The successful bidder on each contract will be required to give bond and comply with the city charter respecting contracts.

The Board of Awards reserves the right to reject any and all bids.

By order of the Sewerage Commission.
(Signed) PETER LEARY, JR.,
Chairman.
(Signed) Harry W. Rodgers,
Secretary.

Approved:
(Signed) GEO. N. NUMSEN,
President, pro tem., Board of Awards.

PAVING.

Norfolk, Va., Jan. 10, 1910.

Sealed proposals will be received by the Board of Control at its office in the City of Norfolk Va., until 12 o'clock noon on the 8th day of February, 1910, for regulating and repaving with some smooth material, parts of Granby and Chapel Streets in the said city.

Bids must be made for each street separately.

Specifications with all other information may be obtained on application to the City Engineer, Norfolk, Va.

Certified checks for ten per cent of the amount bid must accompany each separate proposal, under the conditions set forth in "Instructions to Bidders."

The right to reject any or all bids is reserved by the Board of Control.

THE BOARD OF CONTROL.
Norfolk, Va.

W. T. BROOKE,
City Engineer.

CITY AUDITORIUM.

Houston, Tex., Dec. 21, 1909.

Sealed proposals will be received at the office of Dan C. Smith, Jr., City Controller and Secretary, City Hall, Houston, Tex., until 12 m., Monday, February 7, 1910, for performing all labor and furnishing all material for the erection and completion of the new City Auditorium, in accordance with the plans and specifications of Mauran & Russell, Architects, Houston and St. Louis. Specifications and plans and form of proposal can be obtained in payment of ten dollars ($10.00) at the office of F. L. Dormant, Consulting Engineer, or at the office of Mauran & Russell, Chemical Bldg., St. Louis. A certified check of the bidder on any bank in Houston, Tex., payable to the order of H. B. Rice, Mayor, for $5.000.00 will be required to be deposited with the bid. The successful bidder will be required to give bond and comply with the city charter respecting contracts, and to execute the usual form of contract as prepared by the City Attorney. The right is reserved to reject any or all bids, or to accept any bid considered advantageous to the City of Houston.

H. B. RICE, Mayor.

ROAD WORK.

Gordon, Ala., Dec. 20, 1909.

Sealed bids will be received at the office of W. J. Parish, County Commissioner, Gordon, Ala., until March 15, 1910, for the construction of 51 miles of graded roads in Houston County. The plans and profiles for same are at the office of Probate Judge, Dothan, Ala., copies of which will be sent upon request. Address

W. J. PARISH,
County Commissioner, Gordon, Ala.

REMODELING WATER-WORKS PLANT.

Bloomington, Ill., January 5, 1910.

Sealed proposals will be received by the city of Bloomington, Illinois, until five o'clock p. m., January 25, 1910, for the remodeling of its water-works plant, including the reconstruction and remodeling of buildings. One 6,000,000 or two 4,000,000 gallons pumps, a battery of boilers, stack, main connections and all other work to be done and machinery and appliances to be furnished in and for the said work according to the plans and specifications therefor now on file in the office of the city clerk of the city of Bloomington.

Bidders and contractors are advised to consult the ordinance passed by the City Council of the city of Bloomington therefor at its regular meeting, held Friday, December 31, 1909.

Copies of plans and specifications may be had upon application to F. H. Lamp, superintendent of water and light, at his office at the city hall in the city of Bloomington.

All bids must be accompanied with a certified check made payable to R. Maxton, City Comptroller of the city of Bloomington, for five per cent of the amount of the bid, as an evidence of good faith, the same to be forfeited to the city of Bloomington upon a failure of the bidder to accept contract upon any bid accepted.

All bids should be addressed to R. Maxton, City Comptroller of the city of Bloomington, Illinois.

The city of Bloomington reserves the right to reject any and all bids.

H. W. ULBRICH,
E. E. JONES,
J. C. MEANS,
Water Board of the City of Bloomington.

NOW READY

Cost Keeping and Management Engineering

By HALBERT P. GILLETTE and RICHARD T. DANA

This is the first book ever published on the subject of cost keeping on contract work. Its authors are pioneers in the field, and, although they have written much that has appeared in the form of articles—particularly in the pages of *Engineering-Contracting*—this book is the first presentation on the subject in a complete and logical sequence.

In the opening chapter the authors endeavor to reduce the **management of men** to a science, by laying down **ten fundamental laws of management,** each of which is fully discussed.

The secon chdapter contains **17 fundamental rules for securing minimum cost.** These two chapters are wholly novel and of far reaching importance to all men who are, or hope to be, in charge of other men.

The authors then proceed to describe and illustrate their own systems of cost keeping, which they have developed on their own contract work and have also been installed on the work of other contractors, giving both the **punch card reports**—a form of report which they were the first to devise—and the more common blanks to be filled in with pencil.

The last chapter contains numerous systems of cost keeping developed by other engineers and contractors, and is a **veritable mine of suggestive hints** as well as of examples of excellent blanks for special purposes.

The following is the list of chapters:

CHAPTER I—The Ten Laws of Management.
CHAPTER II—Rules for Securing Minimum Cost.
CHAPTER III—Piece Rate, Bonus and Other Systems of Payment.
CHAPTER IV—Measuring the Output of Workmen.
CHAPTER V—Cost Keeping.
CHAPTER VI—Office Appliances and Methods.
CHAPTER VII—Bookkeeping for Small Contractors.
CHAPTER VIII—Miscellaneous Cost Report Blanks and Systems of Cost Keeping.

Cloth, 6 x 9 inches, 360 pages. Price $3.50 net, postpaid.

SPECIAL OFFER—"Cost Keeping and Management Engineering" and One Year's Subscription to Engineering-Contracting—$5.00.

Incompetence and the Tribute It Levies.

In the pages of ENGINEERING-CONTRACTING two classes of articles stand out prominently. The one deals with well conducted work and is designed to show young and comparatively inexperienced men the methods whereby men succeed. The other class deals with work that is not well conducted and the object of publication is to hold up to view examples of how not to do things. That the latter examples are generally selected from reports of work in cities is incidental. This paper holds no brief for contractors, but does believe all engineers should have business training if they are to go into business as contractors; and successful contractors are only successful because they must be business men. Of two equally competent men, that one meets with the greatest success who has the opportunity to make the greatest gain.

In "Bradstreet's" the percentages of failures for 1908 were classed as follows:

Lack of capital	31.2
Incompetence	21.6
Disaster, etc.	18.9
Fraud	11.5
Inexperience	4.0
Neglect	2.2
Unwise credits	2.0
Failures of others	1.8
Competition	1.8
Extravagance	1.0
Speculation	1.0
Total	100.0

In looking over the list the following items seem to be in the one class:

Incompetence	21.6
Inexperience	4.0
Neglect	2.2
Competition	1.8
Total	29.6

They should really all be under the one heading of incompetence and it means that of the men who fail in business nearly 3 out of 10 fail because they are unfit. Taking up the subjects in reverse order it is found that nearly 2 per cent fail because of competition. Competition is the life of life itself and is the spur that forces men on to success. When a man succumbs to competition he is unfit, for being forced out by larger concerns is a failure classified under "Lack of Capital."

A little over 2 per cent fail because of neglect of business and this is plain incompetence. It speaks well for men in general that so few fail because of inattention to business. Inexperience claims 4 per cent and this is plainly incompetence, for no one is more incompetent than an inexperienced man if he lacks the wisdom to allow himself to be guided by competent men. In the list sheer incompetence is blamed for 21.6 per cent of all failures. Suppose we go one step farther and say that, lack of capital and disasters excepted, all failures are caused by incompetence, inexperience and carelessness, the three of which can properly be classed as incompetence.

Lack of capital simply means that men undertook more than they could carry out. In many cases such a cause for failure is a compliment, in that it implies that a man may have started a business which grew so fast that he was unable to supply the demand he himself created for his goods. Such a thing has happened in the contracting business where firms have bid on a number of jobs at the same time, never thinking to secure more than one or two, and they were found to be the lowest bidders on more work than they could undertake. Such failures may have meant that the men really knew their business very well. Disasters in the above list mean acts of Providence, for which the victim was in nowise to blame and which care on his part could not avert. This then leaves to incompetence the responsibility for practically 47 per cent of the failures in business life. It is freely stated by students of the subject that out of 100 men going into business for themselves about 85 fail, which means that about 37 men out of 100 are doomed to fail because incompetent to succeed.

Assuming that 37 men out of every 100 who go into busness for themselves are incompetent we are warranted in believing that at least this proportion exists among men in public positions. Assuming that this is true and that in the course of time the proportion of incompetent business men increases in public positions one great cause for the unbusinesslike administration of American cities is discovered. An incompetent or unfit man seeks always his path along lines of least resistance. His subordinates naturally imitate him and the few good ones among them cannot overcome the inertia surrounding them. Our examples of high cost and inefficient management of work have been pretty generally selected from municipal reports because on close analysis such examples abound in these reports. Incompetence in the elected or appointed official (21.6 per cent) coupled with fraud on his part or perhaps on the part of some subordinate (11.5 per cent), inexperience all through the organization (4 per cent), neglect of many items (2.2 per cent) and extravagance (1 per cent) in every individual connected with the work results in the levy of a heavy tribute on the tax payer.

When work is let by contract the contractor who obtains it is an example of the survival of the fittest. He is competent because of experience in his work and he has learned to guard against neglect and extravagance. He watches every detail of his work and measures every day's output by the dollar standard. Descriptions of the methods of doing things used by successful contractors are of value to students, but a close study of methods of doing things by incompetent men are no less valuable, provided the fact is pressed home that one is good practice and the other is bad.

In the city of Chicago an official recently resigned who blamed certain subordinates for his being compelled to resign. He admitted that in certain matters he did not possess enough knowledge of the subject under discussion to be able to judge, so was compelled to rely on his skilled subordinates. Without at present expressing any opinion on the subject which led to his resignation we do claim that his letter trying to throw all the blame on his subordinates was a confession of incompetency. A qualified engineer should have held this position instead of a politician who confessed he knew nothing about the details of the work. The man at the top does not have to deal with the petty details personally, but should have such a knowledge of them that he can know when his subordinates are neglecting them or trying to mislead him. To lessen the amount of tribute levied by incompetence is the object of this paper and it is our reason for laying so much stress on details. A man diligent in his business stands before the mighty ones and stands not with small men.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Reinforced Concrete Arch Bridge Bexar County, Texas.

The following information regarding the reinforced concrete arch bridge on the Pleasanton road over the Medina River in Bexar County, Texas, has been given to us by the designing engineer, Mr. Terrell Bartlett, C. E., of San Antonio, Texas.

The Medina River at the proposed bridge location flows through a gorge, shown in cross section by Fig. 1. The river is subject to occasional rises and is never dry at the bridge site. Three test pits were sunk to rock foundation and they are shown underneath the piers in Fig. 1. Under the north pier site the top alluvial soil was found to be 7.5 ft. deep, underlaid with 1 ft. of light, gravelly hard pan and then 8 ft. more alluvial soil. Under this was found 3.5 ft. of loose gravel and blue clay for a depth of 16 ft. to hard shale. Under the middle pier site the alluvial soil was found to be 3 ft. deep, 8 ft. of coarse gravel, 2 ft. of soft clay, 3.5 ft. of fine, loose gravel, 11.5 ft. of blue clay to shale. On the site of the south pier the test pits showed 9 ft. of alluvial soil, 12 ft. of loose gravel, 2 ft. of red clay, 6 ins. of fine gravel, 1 ft. of blue clay and under this hard rock. The bridge site is approximately ten miles by first class macadam road from the railway yards nearest San Antonio. Stone for concrete can be obtained from ledges about 300 ft. from south end of bridge and sand from pits at a distance of 4 to 6 miles. At ordinary low water stage all three piers will be on dry land.

The bridge is of reinforced concrete of four spans. The two main arches are two ribbed and each span is 110 ft., with 20-ft. rise. The two end arches are of 20-ft. span each. The over-all length is 342 ft. The arch ribs support spandrels of open columnar construction, which in turn support a reinforced slab floor system, including railways and an 18-ft. roadway. The pavement is of gravel macadam and drainage is provided. The approaches to the bridge are made by earth fills. All parts of the structure above the springing lines of the arch rings, spandrels, floor system, railings, wing walls, and portions of abutments and piers adjacent to junction of arch ribs, as shown on drawings, are of 1:2:4 concrete. Main abutments and piers are of 1:3:6 concrete, extending 1 ft. below the tops of the wooden piles, all of which are cut off below the lowest low water height. The wooden piles are 8 ins. in diameter at the bottom, 12 ins. diameter at the top and are driven to bed rock. The approach abutments rest on concrete piles 20 ft. long, 18 ins. in diameter at the top and 8 ins. in diameter at the bottom, of 1:4:8 concrete. Rubble stones are permitted in foundations and abutments, but there must be a space of not less than 3 ins. between each stone and the stones must be kept at least 12 ins. from the faces of the structure. Adjacent to the spring lines of the arches a 1:2:4 concrete must be used. The reinforcement throughout is of cold twisted squares of medium steel. Full length bars are used when practicable, but if lapped the lap must be not less than 50 times the thickness. In special cases a less lap will be permitted if suitable clips or clamps are used.

The finish on faces of the concrete work is obtained entirely by spading, and no whitewashing or rubbing will be permitted by the engineer. In criticism of the plans and specifications this one clause can be properly objected to as tending unduly to increase the cost of a highway bridge 10 miles from a city. Even in the largest cities such a clause has been found almost impossible to carry out fully. It is not a good clause when wooden forms are used, and this specification reads:

> All concrete facing on exposed surfaces shall be finished by spading. The forms shall be so carefully placed that when removed, the concrete will present a smooth, hard surface, and will require no whitewashing or rubbing to make the surface uniform.

The specifications provide that it is necessary to construct one set of main ribs complete throughout the two spans before striking any centers, the centers after a proper interval of time to be shifted to the other side of the bridge for the second set of main ribs. Each arch rib has to be constructed in one operation, the contractor working night and day if necessary to accomplish this result. Instead of loading the crown first, as is often done, the pouring of the ribs is proceeded with simultaneously on each side from the abutments to the crown. The reinforcing bars for the cross struts are placed and built into the first set of ribs with projecting ends to be built into the second set of ribs as built, the cross struts inclosing these bars to be poured after the completion of the second set of ribs.

At the crown the bars for the floor are placed while the first set of ribs is under construction and this portion of the floor slab is

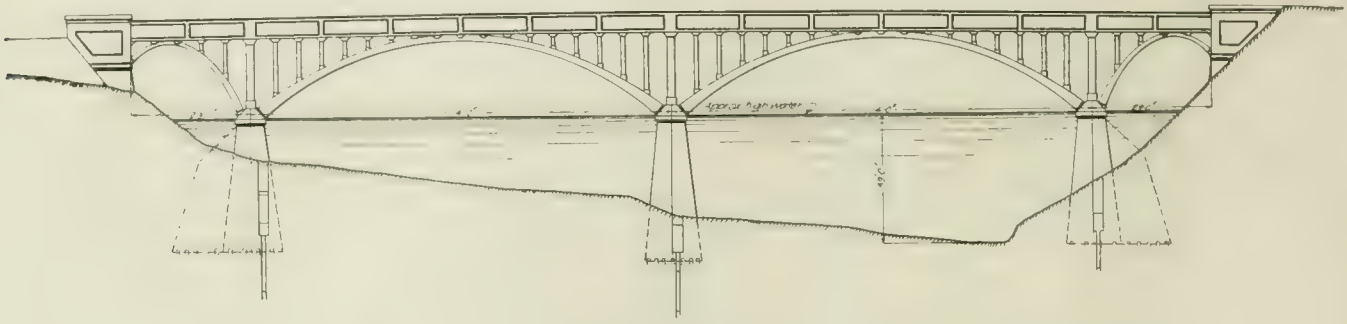

Fig. 1—General Elevation of Reinforced Concrete Arch Bridge, Bexar County, Texas.

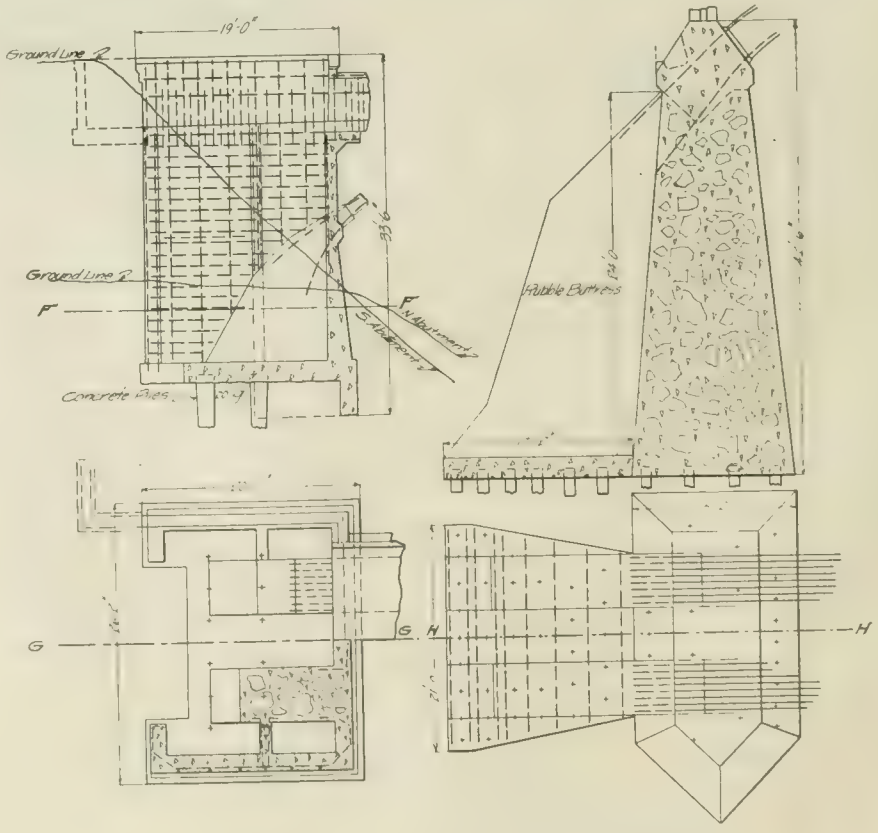

Fig. 2—Details of End Piers, Bexar County Bridge.

poured simultaneously with the second set of ribs. Spandrel columns are constructed as monoliths from the pedestals to the floor system. Expansion joints 1 in. wide and filled with pitch are placed where shown, the floor system, including floor beams, corbels, brackets and slabs, being constructed as a monolith between expansion joints. Through the floor 20 drainage holes 3 ins. in diameter are placed, these holes being formed by collapsible wood cores, pipe being prohibited. Railing and curbs are built in place after the completion of the floor, with expansion joints, as shown, filled with pitch.

Figure 1 is an elevation from the drawings of the engineer. The ribs end in buttresses back of the main abutments, Fig. 2 giving details of buttresses for the main ribs as well as for the approach span ribs. The inclosing walls for the approach abutments are also shown. The approach arches have free joints on cylindrical lead bearing plates as shown. None of the other arches are hinged. Figure 3 gives detail of expansion joint in floor and railing, a ¼-in. lead bearing plate being used and the vertical joint filled with pitch.

Figure 3 illustrates the arch ribs. The reinforcement in the main arch rib consists of eight 1⅛-in. bars continuous from end to end in each rib, the spacing being about 7½ ins. In the top and bottom of each rib are ¾-in. transverse bars 4 ft. 6 ins. long spaced 5 ft. apart. In each small arch rib are eight ¾-in. bars spaced about 7½ ins. apart with ¾-in. transverse bars 4 ft. 6 ins. long spaced 5 ft. apart. In each connecting strut for the large ribs four 1⅛-in. bars 10 ft. long are used, the same number of ¾-in. bars being used in the cross struts for the small arch ribs. In the spandrel columns the reinforcement consists of ¾-in. bars spaced 16 ins. on centers. The railing reinforcement consists of ⅝-in., ⅜-in. and ½-in. bars.

Figure 4 shows a cross section at the crown where the arch ribs form the floor also, the curb and rail being cantilevered to obtain full width. The floor slab proper begins at a point 12 ft. 6 ins. from the center of the arch and at this point is 12 ins. higher than the top surface of the rib, from this point going on a level to the ends of the bridge, carried on beams supported by spandrel columns. The floor slab is 11 ins. thick, reinforced with ½-in. bars longitudinally with the bridge and spaced 5½ ins. c. to c., the cross bearing bars, spaced 26 ins. apart, being ½ in. square and going up into the rails, acting there as reinforcement. The macadam is 8 ins. thick in the middle of the roadway and 6 ins. thick at the sides.

The engineer's estimates gave approximately 849 cu. yds. of 1:2:4 concrete, 72 cu. yds of 1:3:6 concrete of small stone and 1,603 cu. yds. of 1:3:6 rubble concrete, 99,400 lbs. of steel, 200 sq. ft. of lead, 2,300 lin. ft. of wood piling, 480 lin. ft. of concrete piling, 2,000 cu. yds. of wet excavation, 400 cu. yds. of dry excavation, 3,500 cu. yds. of embankment in the north approach and 600 cu. yds. of excavation in the south approach, and 350 cu. yds. of gravel to be loosely deposited, the county to do the rolling.

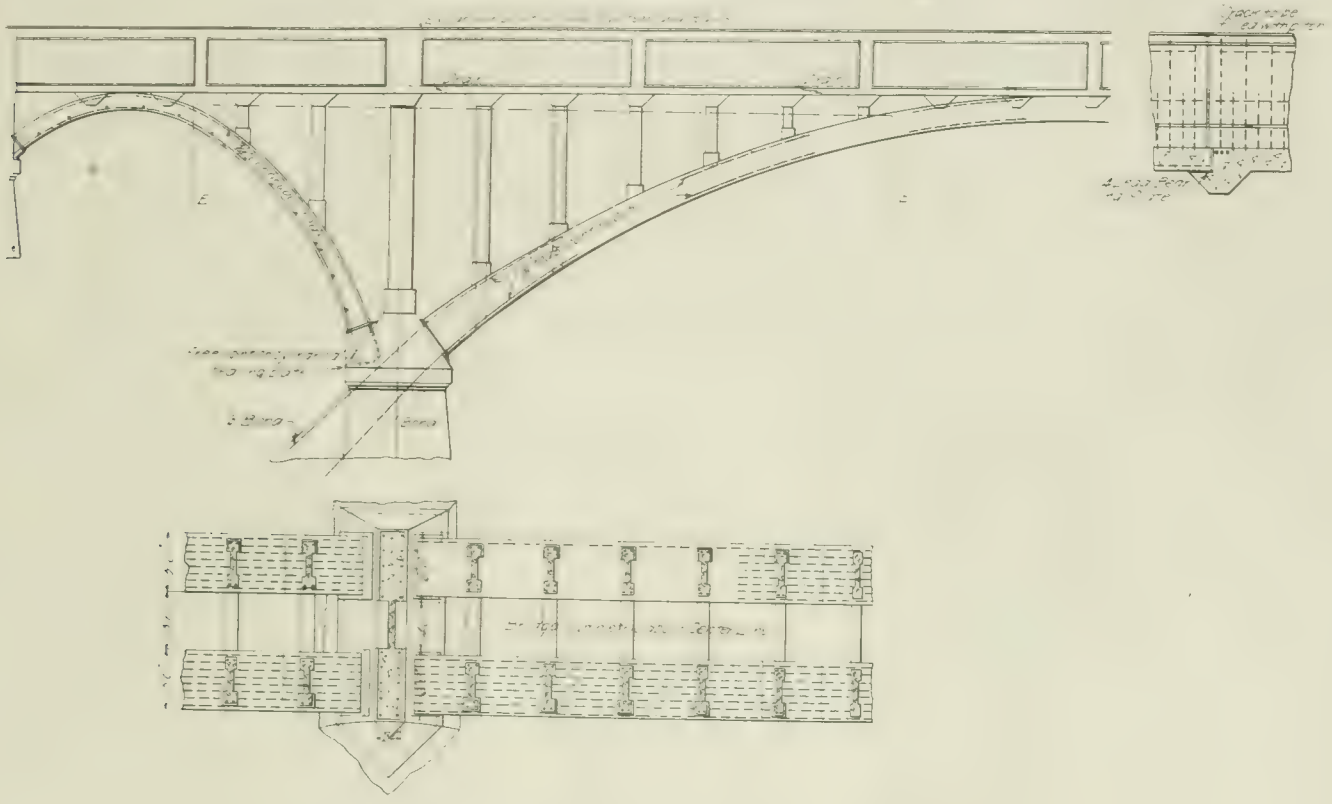

Fig. 3—Details of Arch Ribs, Bexar County Bridge.

The Grand Trunk Pacific is now operating three steamers on the Skeena river, and they are busily engaged in transporting supplies for the mining and trading of the interior country. The Skeena River is one of the principal torrential streams of British Columbia, and its fisheries are noted.

A terminal storage and transfer elevator under construction at Fort William has a total capacity of about 10,000,000 bushels. The first unit of this elevator is rapidly nearing completion, and will hold 3,800,000 bushels.

Reducing the Cost of Concrete Building Work One-Tenth by Raising Labor Efficiency by Rivalry.

BY WALTER B. SNOW.*

Every workable device for increasing the efficiency of labor is of importance to the contractor, and there is therefore considerable suggestive value in the experience of the Aberthaw Construction Co., of Boston, with the competitive working of labor gangs engaged in similar work on the same job. This company has for years past used this device for stimulating labor whenever the circumstances of a construction job made a friendly rivalry between gangs possible. The most striking results of the system, however, were obtained in the recent construction of twin buildings for the Winchester Repeating Arms Co., at New Haven, Conn.

The work consisted of two buildings lying side by side, and connected by a middle structure which provided toilet rooms, elevators, and a passage way between the two wings. With the exception of a steel frame, plaster walled storage room to go on the roof of one of them, the wings were precisely alike, each 300x60 ft., two stories high, with columns spaced 20 by 24 ft. and built heavily enough to

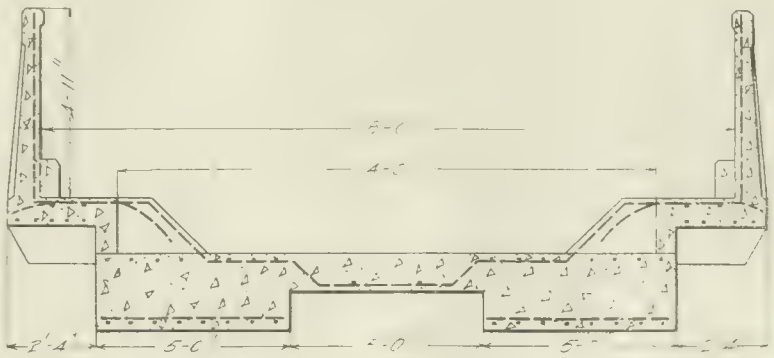

Fig. 4—Transverse Section of Bexar County Bridge.

*170 Summer St., Boston, Mass.

allow of the later addition of two more stories. The interior had flat slab concrete floors built on the Turner mushroom system supported by steel columns. There was a tunnel running under both buildings.

The amount of work involved in each building was carefully estimated and a dividing line was drawn 6 ft. 8 ins. on one side of the center of the connecting corridor so as to mark off two equal jobs; the two foremen who were to be put in charge of the two buildings agreed, after seeing the estimates, that the division was an absolutely fair one. They snapped up a cent for choice of sides. The two competing gangs were given duplicate equipment, the foremen were allowed to select their labor bosses, carpenter foremen, and to some extent were given a free hand in the number of carpenters and laborers that were to be employed on their respective buildings. A bonus was promised to these two foremen, to be divided in a given proportion according to the labor economy realized on the two buildings in executing the work.

The company organized the job on the plan followed in all its larger work. A superintendent, with such clerks as he required, was given responsible charge of the entire job and the handling of all ocal and minor business details. He reported to the president of the company, who visited the work at short intervals and put in such time as was necessary. In addition to the superintendent the company detailed from its own permanent forces a time keeper, two foremen (one for each wing of the building), one labor boss and a carpenter boss with six or eight experienced men under him for each wing. All the rest of the labor force was recruited on the ground. The company uses an accounting system which shows unit cost of each item, the progress and the cost of labor and material used. On this job the reports on each wing were kept separate. Placing the forms and handling the concrete naturally made up the chief labor cost of the work.

Rivalry between the two sides began at the start of the job and continued with increasing keenness until the end. The carpenters on the two wings were separated only by the width of the central court and were in plain view of each other. The amount of centering placed by the carpenters on one side was carefully noted by the men on the corresponding work of the other building, who made an effort to do better. The north wing started two days ahead of the south building, and the marks set up by the men on the north side drew corresponding speed from the men on the other side. The two mixers were placed side by side on the Winchester Ave. end of the buildings, so that the two concrete gangs worked from the same stock pile side by side.

A 50 per cent increase in the amount of concrete laid in a day was striking testimony to the gain in labor efficiency that resulted largely from the competition. At the outset the casting of two bays' length of floor the full width of the building was counted a good day's work. But towards the end of the job three bays were laid in 8 hours. Part of this gain was no doubt chargeable to practice, but the spirit of the game deserves most of the credit. The labor boss on the north wing had been with the company for a long time, and had handled well the labor on the 8-story Baxter Building, at Portland, Me., where the company had built at the rate of a story per week. But neither on the Portland job nor on other large work that he had handled successfully had this foreman ever put in concrete so cheaply or so great an amount per day as on the New Haven job.

In computing the saving on labor costs due to this competition of working gangs, the basis of comparison is necessarily somewhat a matter of opinion. The Aberthaw company adopted as a basis the unit labor costs per yard of concrete, per square foot of forms, and per ton of steel, in two other concrete buildings of about the same size as those at New Haven. Using this standard it appeared that the saving in labor costs on the New Haven job was 19 per cent on the concrete labor, 5 per cent on the labor on forms, and 22 per cent on the labor on steel erection. The total saving on all labor items was 10.8 per cent of the labor cost for the job as it would have been without competition, figured from the other buildings taken as standard work. In any such estimate there is of course room for differences of opinion because the labor cost in concrete buildings is so largely influenced by matters of design, and in estimating the weight to be assigned to such differences judges might not exactly agree. But with all reasonable allowances on this head it seems evident that by this competitive system the Aberthaw Company did get out of its New Haven job with an outlay for labor about 10 per cent less than that outlay would have been without the rivalry between the working gangs. There was less than $400 difference in the labor cost of the two wings.

So far as the laborers were concerned the spirit of rivalry created an atmosphere of play which pervaded everything and lasted throughout the job. The concrete laborers were largely Italians, but they, as well as the others, showed the keenest interest in the progress of the competition and went at their jobs day after day with all the zest of sport.

Carefully restrained, and not pushed to the extreme which would lead to the evident mistake of over-hasty and imperfect concrete work, competition of this sort evidently has a considerable practical value, and gets from the laborer more work and work done in a spirit of greater content and interest than is otherwise possible. The superintendent in charge needs considerable tact in dealing with the workmen, and he needs to insist very rigidly on the best quality of work; but with all these complications the competitive system is evidently within limits a practicable way of raising the efficiency of labor and thus of cutting down the total labor cost of construction.

Notes On English Concrete Work

At the Dec. 16, 1909, meeting of the Canadian Society of Civil Engineers Mr. A. D. Swan read a paper on the docks recently built in Bristol, England, on which work he was resident engineer. He stated that the stock of cement was never allowed to fall below 6,000 tons, specially designed storage sheds being erected to store it. When delivered on the works it was emptied from the bags and kept thoroughly dry and well aerated. The bins were constructed of timber in the usual manner, but the sides were pierced with holes, 1½ ins. in diameter, 20 ins. apart, in two rows near the bottom of the bin. Compressed air was supplied from a compressor to each shed by means of a pipe running the whole length of the building, with connections at intervals for rubber hose. A perforated wrought iron pipe 1 in. in diameter was inserted through each hole and one end attached by rubber hose to the air pipe, the other end being supplied with a solid point. Air was then admitted at a pressure of about 5 lbs. per square inch and kept on until it escaped at the top of the bin.

A number of 6-in. cubes of concrete were made of gravel taken from the same heap. Half the cubes were made with unwashed gravel and an equal number with gravel carefully washed. After a month the blocks were tested, and the unwashed material began to crack at an average of about 828 lbs. per square inch and crushed completely at an average of about 940 lbs. per square inch. The concrete made of washed material began to crack at an average of about 1,260 lbs. per square inch and crushed completely at an average of about 1,850 lbs. per square inch., or practically double the strength of concrete made of unwashed gravel. The water used for mixing the concrete was fresh and averaged about 21 gals. per cubic yard.

Mr. Swan expressed the opinion that sound, impervious concrete using first class cement is not affected to any extent, if at all, by sea water. In nearly all the walls large pieces of rubble stone, "plums" the English engineers call them, were embedded in the concrete, the saving being from $1 to $1.25 per cubic yard, and it was claimed that the wall was made heavier in this way. Where the concrete was deposited in heavily timbered trenches these large stone could be used to about 6 to 8 per cent only of the total bulk. In open work the author saw from 20 to 35 per cent used.

The U. S. Geological Survey has just issued Bulletin 416 entitled Recent Development of the Producer-Gas Power Plant in the United States by Robert Heywood Fernald. It is a careful study of what has been done and the author concludes that in the United States cheaper power is constantly sought. The water-power possibilities of the country are being realized and the hydro-electric power plant is a wholesome cause of competition. The supply of fuel of marketable grades is not unlimited. Prices for such fuel must of necessity increase. The cost of transporting coal from the mines is high, and the possibility of obtaining a sufficient supply of cars to handle low-grade fuels is questionable. The power demands of the country are increasing, and this power must be developed at a reasonable cost. The time is approaching when the cheapest fuel obtainable must be used to the best economic advantage in order to develop power at a unit cost consistent with commercial progress.

Consideration of the conditions indicates that in order to keep the price of power developed from fuel down to a consistent figure—

(a) Grades of fuel which warrant transportation, or which may be defined as "marketable," should be used with the greatest practicable economy.

(b) The very large percentage of coal of so-called low grade which today is left at or in the mine must be utilized.

(c) Advantage must be taken of the large deposits of lignite and peat which are found in many sections of the country.

It is undoubtedly true that in general, under conditions which do not require the use of steam for other than power purposes, the producer-gas power plant meets the requirements of (a).

At present the only method of advantageously handling the fuels mentioned in (b) and (c) is in the gas producer, and the utilization of these lower grades of fuel on an extensive scale demands concentration of the power plants within close proximity to the fuel supply.

The logical conclusion from a careful study of the producer-gas power situation is that the time is not distant when financial interests in power production will be directed toward the centralization of the producer-gas power plant at the mines and the distribution of the energy developed either by high-voltage long-distance electrical transmission or by pipe systems for conveying the gas.

While the proposition to transmit energy from coal mines in the form of electricity is not new, this is the first time we remember seeing it recommended that gas be conveyed to any distance.

Importance of Having More Than One Station for Rainfall Observations.—The importance of extending the field of observation on rainfall for run-off studies from that of single station record to a series of properly located stations covering the urban area cannot be well overestimated. The design of all drainage works being so dependent upon rainfall data, it is considered a matter of primary importance that the observations be sufficiently complete so that the study and analysis of run-off can be intelligently made, leading to less dependence upon the approximations by the empirical formulae. In the report of the Engineer Department of the District of Columbia for the last fiscal year the following abstract from the record of a 1909 storm is given to show the serious error of relying upon a single station observation:

Time (rainfall in ins.)	Station 1. Ins	Station 2. Ins	Station 3. Ins
To 8 p. m.	0.00	0.00	0.00
To 9 p. m.	.10	.14	.06
To 10 p. m.	.55	.98	.20
To 11 p. m.	1.02	1.32	1.25
To 12	1.31	2.57	1.54
To 1 a. m.	1.81	3.16	2.95
To 2 a. m.	1.91	3.16	3.42

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

A Novel Locomotive Rock Drill and a Remarkable Drilling Record.*

Successive "new records" made in rock cutting operations are often not fairly comparable with either preceding or succeeding records elsewhere made, on account of the differences in the conditions under which they are made. Thus the rock-filling record set forth in the following may not be properly comparable with performances in other cases of rock-drill work. But it is sufficiently striking and notable in itself, and may point the way toward more efficient methods of wide applicability.

This record was made in the work of excavating the Livingstone Channel, a detail of the improvement of the Detroit river. Here was a straight channel to be cut in rock, 300 ft. wide, in the bottom of the river. The contractors for the section in question are Grant, Smith & Company & Locker; the work lies between Amherstburg, Ont., and Grosse Isle, Mich.

The area to be worked over was enclosed by cofferdams at each end, so that the operations were entirely "dry." The entire site was commanded by three Lidgerwood cable conveyors movable lengthwise of the channel as the work progressed; these conveyed all the material from the excavation and dumped it at a sufficient distance on either side. The overlying earth and loose stones were first removed by the aid of steam shovels, with which operation we at present have nothing to do, and then there remained a clear surface of rock to be excavated to a varying depth up to 12 ft. and over. The material is a soft lime rock running into dolomite and is unusually free from seams, making it a comparatively easy proposition for the rock drill.

The drilling over the entire surface was all done in a single operation to the required bottom level. In commencing the drilling what might be called a standard equipment was employed, consisting of the usual type of rock drills, air operated, mounted on tripods and requiring two men for each. These drills were moved from hole to hole, usually a distance of about 8 ft., as required. These, of course, required a change of bit for every 2 ft. of depth of hole drilled, and a successive reduction of gage for each additional steel, so that to drill to a depth of 14 ft. and a bottom diameter of 3 ins., seven steels would be required with 3¾ or 3⅞ ins. for the starter. The actual average rate of the drills on this work was about 46 ft. of hole for an eight-hour shift. Four 3¼-in. Ingersoll-Rand drills were crowded all the time to keep one cable conveyor occupied.

A locomotive rock drill has recently been devised which has revolutionized all this. It is the invention of Mr. C. H. Locker, of the firm above referred to. It comprises in fact a single rock drill with a carriage and mounting and air-power devices which enable it to keep at work, actually drilling, as constantly as possible and *minimize the delays* required for shifting from hole to hole, for changing the steels, and for raising the drill by the feed screw when either change is made. This drill has largely made its record by avoiding stops, just as the big through express trains do. It has also the additional advantage of extra weight and power, which would not be practically available in a drill entirely operated and moved about by hand.

Briefly described, there is a horizontal frame built of heavy timbers and mounted upon four wide-tread wheels, those in front being on a fixed axle while those in the rear are swiveled for steering. There is a vertical air receiver or "air dryer," as they call it, on the rear of the platform and in front of this is a two-cylinder reversible hoisting engine which supplies the power for the several operations required. An extension of the shaft carries a small sprocket-wheel which connects by a chain to a larger sprocket driving the front carrying-wheel when the machine is to be moved. In front is a vertical heavily braced gallows-frame which carries the drill. When everything is in place the preponderance of weight is upon the front wheels, which is as it should be, and when the apparatus is in exact position for starting a hole the two jackscrews seen in front are set down solid upon the rock taking most of the weight and holding everything rigidly in place. The manipulation of these jackscrews is the only hand operation involved when changes of position are made.

The drill used in this case is a 5-in. Ingersoll-Rand machine ("H2"). The first change made in it was to dispense with the usual shell or guide in which the drill cylinder travels up and down by the operation of the slow-acting feed screw. In place of the drill shell the front of this carriage provides vertical guides in which the drill cylinder fits as in its original shell, but with a travel of 10 ft. instead of 2 or 2½ ft. The drill is suspended by a wide cable of suitable size carried to the drum of the hoisting engine, one or two revolutions of which will raise the drill from the bottom to the top of the guides.

A single steel is used of sufficient length to take advantage of nearly the entire vertical travel of the drill cylinder. The feed is entirely by the suspended weight of the drill, a slow retrograde movement of the hoisting drum being accomplished by a worm gear arrangement which can be clutched in or out as required (as is also the fast speed for hoisting the drill and withdrawing the steel from the hole). Holes to a depth of 8 ft. can thus be drilled with a single steel without a stoppage, and the loss of gage in the operation is in this rock scarcely noticeable. For keeping the drill in place when starting there is a guide attached to the front of the machine and brought down quite close to the rock. This guide of course does not fit the steel, but gives it a little liberty to dodge around, while still locating the beginning of the hole with sufficient accuracy. The front half of this guide is hinged and can be swung back out of the way when changing steels.

It is not necessary to describe this apparatus any more in detail. It is evidently a crude and, in a way, merely an experimental arrangement; even the air hoisting-engine was home-made. The machine is already being replaced by a carefully designed machine constructed entirely of steel and with additional provisions for economy and facility of operation. However, such as it is it has worked steadily for two or three months or more and made astonishing records.

The following figures are given by a responsible and careful observer: On Sept. 23, 1909, drilling 3-in. holes, 29 ft. of hole was drilled in 55 min. This included moving the drill four times, the time occupied in moving being about 45 secs. each. On another day the drill was timed for one hour. Handicapping the drill in this case was dull steel and low air pressure. Yet the first hole was drilled to a depth of 7 ft. 8 ins. in 7½ mins., the next hols was 6 ft. 6 ins. in 26½ mins., and at the end of the hour, with five moves, 37 ft. 3 ins. of holes had been drilled.

The following is from another observer: In 32 mins. it put down three holes, 6 ft. 2 ins., 7 ft. 2 ins. and 7 ft. 2 ins., and was moved three times, leaving it ready for the fourth hole, all in 32 mins. In this time there was a delay of 4 mins. caused by the driller neglecting to raise his bar and getting it bent.

The 6 ft. 2 in. hole in this case from start to finish took 5¼ min. The time of moving, that is, from when one hole was finished until another was started, was exactly 2 mins.

The performance of this machine is more strikingly expressed, however, by the following statement: Operated by two men, it took the place of the four tripod drills and eight men, and easily kept well ahead of the conveyor at all times. Its work compared with the tripod drill was approximately as *five to one.* The saving of air consumed has not been investigated.

On the new machine a reheater will be installed, and also a supplementary compressor to generate high-pressure air to follow the drill into the hole and blow out the dust.

*From a paper by Frank Richards in "Compressed Air" for January, 1910.

Some Notes on Handling Men on Construction Work.

The following interesting notes of experience of well known contractors in handling men on construction work so as to obtain the greatest efficiency were brought out in a discussion at the December meeting of the American Society of Engineering Contractors of the paper on "Science of Management Engineering" by Mr. Halbert P. Gillette. This paper was reprinted in full in our issue of Dec. 15, 1909, and can be consulted by readers desirous of seeing the original statements commented on in the following discussion:

F. B. Gilbreth.—No engineering contractor can read the papers of Frederick W. Taylor, past-president of the American Society of Mechanical Engineers, without appreciating the value of the remarkable work that he did in managing men while he was chief engineer of some of the largest steel mills in the world. Wherever he has been in charge he has always accomplished the three most desirable of results, viz: (1)He has decreased costs per unit of output. (2) He has increased the wages of workmen. (3) He has never been opposed by a strike.

The basis of compensation of the workman which has been discussed at length by Mr. Taylor is one of the most important problems that confronts the engineering contractor. The most common bases of compensation are: (1) Day Work. (2) Piece rate. (3) Gift propositions. (4) Premiums. (5) Task and bonus. (6) Differential piece rate.

Each method has its advocates, although local conditions undoubtedly affect the value of the different methods. Many papers have been and could be written about the merits and laws of each of the above systems. But the purpose of all is the same, namely,—to lower production costs.

Mr. Gillette is undoubtedly right when he emphasizes the importance of discovering and applying the law which states the relation of compensation to output, "the law of reward increasing with increased performance," as he words it. But it should not be lost sight of, that there are more than a score of different factors that make for high outputs besides the desire for extra money. Such a factor is the grouping of the men.

Mr. Gillette speaks of "doing away with gang work entirely, or at least of reducing the number of men of each gang." As a typical example from our own experience which proves the wisdom of this method, we found that in loading brick on to packets in a freight car, the brick to be placed right face up and with the tops of the brick all in one direction, the laborers would load the brick for 20 cts. per 1,000, day after day, if there was but one man in each car with his output tallied separately. With two men in the same car, with their outputs tallied together, the average cost was 38 cts. per 1,000, while if 4 men were in the same car the price averaged 45 cts. per 1,000,—and so on upward. When the men were distributed again the costs were 20 cts. per 1,000 whenever their outputs were measured separately. The point to be noticed is the importance of recording the output of each man separately, as a factor in "increasing of performance."

We have found that to measure the output

of each and every man separately costs but little compared with the consequent reduction in costs, even though in some cases it is extremely difficult to do. On a brick wall, for example, it has been difficult to measure accurately the output of each bricklayer, even by marking off the work into sections, and there are many disadvantages to that. Making the bricklayers throw their empty packets into individual piles and counting the empty packets in each pile hourly, solved this problem for us. Counting the empty packets of each individual bricklayer caused them to average some days as high as 375 brick laid per hour.

It is undoubtedly true, as has been said before, in quoting Mr. Gillette's paper, that doing work with gangs of workmen should be avoided. Where gangs are used, athletic contests between gangs of men arranged according to their creeds, color, nationality, or other bonds of sympathy, will increase output. But the highest scores with gangs will never be obtained unless the individual scores of each member of each gang is also kept separately.

Mr. Gillette states that "there are many classes of work that do not admit of working men in small gangs." While this may be occasionally true, it is not true as often as is generally supposed. Sufficient determination will generally discover a way of dividing up the gang so that some unit of measurement of their output or of their efficiency can be made.

We have found that the number of piles that a pile driving gang can drive in a day can be much increased by keeping records of the number of minutes and hundredths of minutes each hour that each man delayed the entire gang by such things as "not steam enough for full speed driving" or "not spare chains enough to permit hooking on immediately within the standard time allotted for hooking on," or "waiting while pile was being measured instead of having each pile plainly marked with its length." This is, perhaps, as hard an example as any, and is a desirable illustration, because it shows that the output of a gang, difficult to separate, can be separated into the output of each man, and the output of each man can be measured by the number of minutes in each hour that he did not delay any other member or members of the gang.

The discussion possible on these factors of "increase of output," that is, grouping the men properly and recording their output separately, shows plainly the immense amount of data that must be accumulated before all the laws of management can be discovered and formulated.

The experience of the members of this society, if written down in the form of instructions to managers, would contribute greatly to the world's knowledge. It would help to solve the problems that arise between the employer and the employee. It would help all of our members and it would help us to become better managers of ourselves and of our employees, who, though they sometimes do not understand us, are after all the best friends we have.

DeWitt V. Moore.—There are classes of labor in which it is perfectly feasible to produce rivalry and competition, as was so well stated by Mr. Gilbreth. But in other classes of labor, where you use large bodies of common labor, it is almost impossible to arrange matters in this way—that is, in a gang such as Mr. Gillette proposes. Where the rate is $1.50 a day, we have some good men, and some second rate men, and some who are "indifferent."

Now, grant that under ordinary circumstances, the work is important and must be accurate, even the indifferent man is of some good; we cannot dispose of him but we must keep him to do what he can do, but his influence is bad on the rest of the organization. If we then attempt to pay him in proportion to the amount of work done—granted that we can keep a record of the individual output of the man—and we pay the better man a greater rate per hour we only have trouble. This is caused by increasing the rate to the better man. In the case of every workman, especially if he is a citizen of the United States, he believes he is the equal of any and every man; and he is not satisfied with your judgment that he is not as good as the other man. So, in work of this character, the only way is to make the better man a working straw boss over the smaller gang, and thereby increase the efficiency of the small gang under him. This is the only way I have found to increase the efficiency of the individual.

It is also difficult to determine the proportion of work accomplished, except by observation of the individual men. A man might be working in a sewer trench along with a bunch of men working in the same trench, then, unless the individual is timed, you have no way of determining how much each man performs. Therefore, it is my opinion, that the only way in which this law could be applied to the heavier and cheaper grade of labor in contract work, would be by the smaller gang unit making a straw boss out of the better man.

There is another point in reference to this subject: that is, the penalty clause. I am not prepared to come to a conclusion on the matter, but it is a subject I have been thinking about for a long time. I have not as yet solved it.

For instance, in one case, a shovel gang was excavating ballast for a railroad under a contract, whereby the pit, also the switching engines and the cars were provided. At the start of the work it was arranged that the men would be paid a minimum daily wage, and would get a bonus for loading over a certain number of cars per day. It was beautiful in theory—it was an ideal pit, dry, plenty of cars, and there was every reason for the workman to earn a bonus on that job. As the work proceeded it was found that it depended upon the co-operation of the general contractor, who was to furnish the switching locomotive and the pit and the cars, and the railroad which was to provide a certain amount of the transportation of the gravel to a point fifty miles away. The general contractor provided two locomotives, but they were in bad repair, and because of his fault in that particular, the output of the gang was decreased. But more than this was the railroad sacrificing gravel shipments for their ordinary run of business. That was a difficulty that could not be overcome in any manner in our power. The railroad gave first attention to their own business, and handled the gravel business as a third-rate business. We had to abandon the bonus system on that job.

I could mention three or four jobs where the lack of co-operation, through relying upon some other party, and where the penalty could not be enforced, defeated the bonus plan with our own men. I believe thoroughly in the bonus system on some work, but there are many difficulties in applying it.

Daniel J. Hauer.—I have been greatly interested in this subject for many years, and although I have not had much experience in paying bonuses, yet I have experimented somewhat with tasks on contract work. I am a very firm believer in the task and bonus system, yet I find it must be tried out very carefully, keeping in mind many other factors that go to make up successful work. For instance, I cannot quite agree with Mr. Gillette in several of his deductions, and some of his statements. I agree with Mr. Harms that in reducing the size of a gang of men, it must be done with consideration to other classes of work or machines that you may have. The idea of Mr. Gillette, as he sets forth, of two men loading a wagon, would be a most expensive one in practice. Team-time is worth 50 cts. an hour, and man-time is $1.50 a day or 15 cts. an hour. To detain a team worth 50 cts. an hour while two men at 30 cts. were loading it up, would be a disastrous policy in an earth-removing contract. The same way with other classes of work of that kind.

I speak of this, not to discourage anyone, or to show that the bonus system cannot be applied; but it is apt to be applied by those who have not given it thorough study, to the detriment of some other element of cost.

Another thing is to decide upon what unit to pay. In many cases you could not pay rock drillers by the foot of hole drilled. If one had a large area of the same kind of rock, where the holes were spaced at equal distances, and the same class of drilling was repeated over and over again, the rock running uniform, one might choose the lineal foot of rock drilled as the unit of payment. But in the vast majority of rock blasting, these conditions are not obtained. The judgment used in placing the holes is a far more important consideration. A man might place the holes very close together, or in soft places where they were not needed. Mr. Gillette's answer is that the foreman must look to that and see that they are not so placed; but one idea of the task and bonus system is to reduce also the cost of superintendence, as this system holds men as slaves to their work, then there must be some basis of payment, so that you do not need this extra superintendence. I find that the better basis for paying in rock drilling, is by the cubic yard of rock excavated, and not by the number of lineal feet of holes drilled.

There are a few other things in Mr. Gillette's paper to which I object, believing we can obtain many of these results by fines. For instance, Mr. Gillette speaks of the engine man who would have his roller steamed up the moment that the working day began, if he is paid a bonus. If a man working for me did not have steam on his dinky engine or roller five or ten minutes before starting time, I would have some other man on his job, and mighty soon. He would have to do that to hold the job, and not because he was paid extra. However, I am a firm believer in this method of rewarding workmen.

During the past month I reduced the cost of hauling cast iron pipe six miles by making a round trip equal to one-half a day's work and two trips one day's work. That was a task, without a bonus, and the cost of hauling case iron pipe was reduced from $3.00 a ton to a little over $1.50 a ton.

W. D. Lockwood.—I believe Mr. Gillette is moving in the right direction; that is to say, "give the men more money"; that is what it amounts to. That is the view the average man takes of it.

Mr. Hauer was speaking of the wagon loading with two men, and he thought there would be a loss through the cost of the teams standing there. Mr. Gillette did not intend to leave the teams standing there doing nothing. He intended to use three wagons, say, with two teams. I have used them in that way and found there was little advantage in so working. I found it was better to let the team take a rest on the wagon, and use a slightly larger load. If I had a space of two or three minutes I would let the men rest. One yell from the foremen, and they would make the dirt fly. They did it quicker because of that rest.

The bonus system one should use depends on the locality. If you are in the south, you want a task. You put a string of "coons" down a line, with so much to do, and the coon thinks he is his own boss; that he has a piece of work, and that it is his work, and "don't you forget it," and "don't you get on my ground." And then he works and makes his dirt fly. The Poles like that, too. But the Italians do not care for it. The Italians would rather drill along eight or nine hours a day, work all day.

Now, in loading brick or handling certain materials in certain places, I do not doubt that it can be done with profit by the bonus system. I haven't had much experience in that. But take a well-managed piece of work, and have a good foreman, and your organization is working together, and you are getting good work, and then talk about increasing the output 50 per cent and you kill your men.

I differ with Mr. Gillette on the point of separating your gangs—that is, good men in one gang and poor men in another. If you put a lot of dummies in one gang, they will all get discouraged. And if you don't let

them go, the other gang will run them off the job. I believe in having a fair distribution right straight through, and working leaders. If you can get one good leader, the men cannot get out of line on a 12-in. plank, and that fellow can keep the gang going, and providing the mixer turns out the concrete fast enough, you will get a good output.

Frank B. Gilbreth.—I think Mr. Gillette is absolutely right in his statement, judged by experience of my own during the past year, where we went into considerable detail in timing the difference between this matter of having one man at the cart, and changing the horses on the cart. You will remember that I said that too much stress cannot be laid on placing every man, so that his work shows up separately. The foreman who gets the biggest opportunity with me is the man who places the largest proportion of men so their work shows up separately.

Now this matter of changing horses on the carts: On a brick job I had about a year ago, six carts were employed with two horses on each cart. Someone suggested that the cost of carts taking bricks up on the floor was much less than to have men do it with wheelbarrows. I happened to be on the job when the controversy was on, and I said, "If you fellows will let four pairs of horses and drivers go home this noon and not come back, I will guarantee to do as much with two drivers and two teams and six carts as you can do now. We backed three carts up against a conveyor with one man in each cart. It took those men about ten minutes to put the bricks in a cart so they would not spill. It took three or four minutes for the driver to haul them to the first floor of the building. There he immediately hitched on to an empty cart and returned to the freight car. The first time we tried it, it took 1.20 minutes to change a horse from one cart to another, but at the end of one day they were trained as well as fire horses, so that the best time in which we ever did it was .35 of a minute. So you see on that scheme, Mr. Gillette was absolutely right. We did as much with two drivers, two pairs of horses and six carts as we did with six drivers, six pairs of horses and six carts, for we did not lose any time in having the horses and drivers tied up while being loaded and unloaded.

Of course the argument is that the horses need the rest. Then a good argument is to say, "Let them rest in the stable." If eight hours are too long for them to work on the job, let them work seven hours and rest the other hour in the stable. We did exactly as much work. I think Mr. Gillette is absolutely right on that point.

Dewitt V. Moore.—My experience has shown me there is a difference. Now in handling brick, tile or cement from a car to a building it is very good to use two or three wagons, according to the size of loads you are hauling, and have it so timed that the team work is almost continuous, having a proper number of men in the cars to load the wagons. In hauling dirt, I never knew it to work out. It is better to load the team quickly and let it get away. The whole proposition assumes that we are working on earth work, with a large body of men, and that the teams are loaded adjacent to this work. Therefore it is a slight interruption only to load the teams. There is a difference in the class of work to be handled as to the method you should adopt.

Daniel J. Hauer.—I want to state that I agree with Mr. Gilbreth. In other words, I did not catch the full drift of Mr. Gillette's meaning. He uses the word "wagons." I took wagons to mean a wagon with two horses in it. I took it to mean teams, as I expressed it, where I mean a horse and a mule to haul dirt, coal, steel or what not.

When I disagreed with Mr. Gillette, I considered that the horses were waiting as well as the vehicle; if that is not what Mr. Gillette meant, it shows the necessity for the warning I spoke of, that one might be readily deceived in trying out this scheme if one took that to mean as I did a team and then followed the suggestion of putting two men at work loading dirt, for I know from actual records kept he would lose money on his teams.

But if he referred to the increasing of the number of his wagons and not necessarily the number of his horses, then under certain conditions, even in dirt hauling, Mr. Gillette is right.

In the past month I was taking dirt out of a railroad cut with dog scrapers. I went there for a few minutes and I said to the man in charge, "You are losing $1.50 a day on each team you are working, and I advise you to take them out." He kept them in a day or so longer, to keep his own records, then he soon decided to take them out. As we did not have wheel scrapers, I said, "Put in slat bottom dump wagons." I went out the second day after and four such wagons were at work with eight horses. The haul was 170 or 175 ft. I said, "If you put two of those teams doing something else, you will take out as much dirt and reduce expenses $8 a day." We reduced the total cost of excavating that earth the next day very nearly 5 cts. a yard, and I noticed several times in passing the work that the men were standing idle for a few moments waiting for a wagon to come up, so I suggested that we put in three wagons for each set of horses. The next day we reduced the cost, over the four wagons, 1 ct. a yard. I have tried that on long hauls for earth and have not found it successful, but on short hauls it is saving money. I believe it is necessary to have individual records, but a man working, especially at earth work, and in the handling of concrete, will not work as rapidly by himself as with another man close by. I could go through my records and give you 25 cases of that. I do not want to be understood as saying that the individual record should not be kept. That is most important of all. But if you can work two or three men at a job, close by one another, so they get a glance at one another once in a while, you will increase their work by keeping their records just as Mr. Gilbreth did with his so called athletic contest.

Design of Combination Timber, Steel and Reinforced Concrete Caissons for the McKinley Bridge, with Some Data on Methods and Rates of Sinking.

The three main spans of the McKinley Bridge at St. Louis are carried on four masonry piers founded on pneumatic caissons. The steel spans are each 517 ft. long; the piers are of concrete faced with limestone masonry and are not unusual. The caissons on which the piers are founded are novel in having a steel cutting edge and a combination timber and reinforced concrete roof and wall construction. They were designed by the contractors, the Missouri Valley Bridge & Iron Co., Leavenworth, Kan. The following description of these caissons and of the methods employed in making them are taken from a paper by C. E. Chase in the *Cornell Civil Engineer* for January, 1910.

The design for the caisson for Pier IV shown in Fig. 1 is representative of all the other caissons. The walls of all but that for Pier III were formed of 6x12 in. timbers, laid horizontally, with butt joints in the middle and halved joints at the corners, and drift-bolted together with ⅞-in. drift bolts, spaced 5 ft. c. to c. The walls were strengthened against the hydraulic pressure to which they were subjected, by 6x8-in. cross and 10x10-in. longitudinal struts, each cross brace being provided with a ¾-in. tension rod to protect the crib against the strains due to launching or pressure of the freshly laid concrete. At intersection points of the struts and also where they met the walls, 6x6-in. posts were provided. The working chamber is 7 ft. high, with 12x12-in. timbers forming the roof. The alternate timbers extend to the side walls, where they are framed in with halved joints. The other roof timbers extend only across the roof of the chamber and meet the upper ends of the timbers forming the side walls of the working chamber. These are 6x12-in., laid at an angle of 45° and framed into the wall timbers in the toe of the cutting edge. At the intersection of the sidewalls, the inclined timbers, necessarily of varying lengths, are protected against upward displacement by 5/16-in. bent plates bolted on the outside. The toe of the cutting edge is encased in ⅜-in. plate iron, composed of a 3-ft. 9-in. and an 8-in. plate on the outside of the caisson, riveted to a 3-ft. bent plate, which extends up the inclined roof of the working chamber on the inside. To protect this iron cutting edge, which was only 1⅛ in. wide, from buckling when settling on bedrock, lugs were riveted to it inside the working chamber, under which shores could be placed when settling on bedrock. These lugs, formed of ½-in. plate and filled with concrete for strength, were spaced 2 ft. c. to c. and provided horizontal bearing areas of 36 sq. ins. each. The caissons were sheathed on the outside with 2x12-in. sheeting, placed vertically and thoroughly calked with oakum.

The reinforcement of the concrete, upon which the caisson depends for its strength, consisted of two layers of ½-in. steel rods, placed longitudinally and transversely of the crib, directly over the roof of the working chamber, and of two rows of ⅝-in. rods, one placed 2 ins. from the wall timbers and the other 2 ins. from the inclined roof timbers in the V-shaped part of the caisson. These latter were provided to take the tensile stresses induced in the concrete of the cutting edge by distortion in either direction. It was intended, after depositing as much concrete in the crib as the timber roof would support, to allow the concrete to set one week, after which the layer of concrete would act as a slab, supporting further layers of concrete. However, the rate of concreting was in general rather slow, and it was considered that the concrete had set sufficiently by the time the full strength of the timber roof had been developed to allow concreting to proceed uninterrupted.

As it was assumed that considerably greater depth of water existed at the site of Pier III, the caisson for that pier was made considerably heavier than those just described. All wall timbers, struts and cross bracing were of 12-in. by 12-in. timbers and in general all the details and splicing were made stronger.

The advantages of this design for the caisson lay in the saving in the amount of timber required, the average proportion of timber to total volume being 13 per cent as against 33 per cent for wooden caissons used on another recent bridge—the saving in time and labor in construction and in the greater ease in sinking and excavating, due to the use of the iron cutting edge. The only disadvantage of the metal cutting edge is that its bearing area is so small, that bearing blocks are required to distribute the weight uniformly and prevent buckling.

The caissons were all constructed on ways erected by the contractor in Venice, Ill. These consisted simply of several rows of 12x12-in. timbers, sloping 1.75-in. to the foot, supported on piles and running far enough into the river to prevent the caissons, when launched, from grounding. The cutting edge arrived from the shop in four sections and was riveted together by hand in the field. When assembled it rested on greased skids or "butterboards" placed on the ways and prevented from sliding by planks which ran to the upper end of the ways, where they were bolted. The caisson timbers, all of longleaf yellow pine, were framed on the spot, hoisted into place with an ordinary boom derrick, and then securely driftbolted together. As soon as the roof of the working chamber was in place the first sections of the main and material shafts, 3 ft. and 2 ft. in diameter, respectively, were hoisted into place and firmly bolted down. These sections were of ⅜-in. boiler plate and were made in three lengths, 4, 8 and 10 ft., the 10-ft. sections weighing 1,800 lbs. Cast iron diaphragms were riveted into each end of each section for bolting them together. Each section could be used as an airlock when doors were properly hung in the diaphragms and valves provided.

As soon as the horizontal wall timbers were completed several courses high, the sheathing

of 2x12-in. plank was spiked into place. The edges of these planks were beveled to facilitate the driving of the oakum, with which the walls of the caisson and roof of the working chamber were tightly caulked against leakage of water and air.

Before the caissons were launched the engineers placed benches on the inside of the crib wall, at a known elevation above the cutting edge, in each corner. These were later used in finding the elevation of the cutting edge when sinking. From the center of each side of the cutting edge a perpendicular was constructed on the outside of the caisson walls, by swinging equal arcs from the corners of the cutting edge. This, after immersion, located the position of the cutting edge regardless of the irregularities of crib construction, as it was prolonged as the caisson sank. Three clusters of piling were driven at the vertices of a triangle just above the future position of the caisson in the river and tied together by horizontal piles, lashed to them. These clusters, together with two others driven downstream, provided for the control tamping was required, the men treading out the air bubbles and voids with their boots, or occasionally using a wooden tamp.

As the caisson sank lower in the water under the weight of the concrete, which was placed at a rate of about 150 cu. yds. per day, the walls of the crib were built up in courses of 6x12-in. timbers, sheathed with vertical 2x12-in. planks and caulked for several feet above the water line. As it touched bottom, a few pounds of air pressure was put on and the "sand-hogs" entered the working chamber to clean out the debris, such as old timbers, butterboards, etc., which were caught in the working chamber in launching or lay on the river bottom.

After the debris on the river bottom had been removed, the caisson was located in the correct position by the engineers, directions for movement being given by observers stationed at opposite ends of the base line. Upon small platforms at the ends of the caisson, points, whose position in reference to the cutting edge was know, were marked. The observers on shore, using the computed angles away the material from one side of the pier, or settling on inclined shores,—but very often without success, as the piers had become very heavy on account of the masonry placed to keep them above high water. Where these methods were unsuccessful in correcting the errors in position the stone shaft was later shifted slightly on the large area of the concrete foundation block, or the batter of the sides modified.

As the caisson neared the bottom, gravel and boulders were often encountered of such size that the blow pipes could not handle them. In this case a large airlock, known as the clay-hoist, was placed in position on top of the material shaft and the material locked through it. When all the debris had been cleaned from the bedrock, using the water jet, a highly polished and hard crystalline limestone was exposed. The bedrock in the bottom of all the piers was deeply corrugated and waterworn. It was drilled several feet to ensure that it was not merely a layer or ledge overlying softer strata, and preparations were then made for sealing.

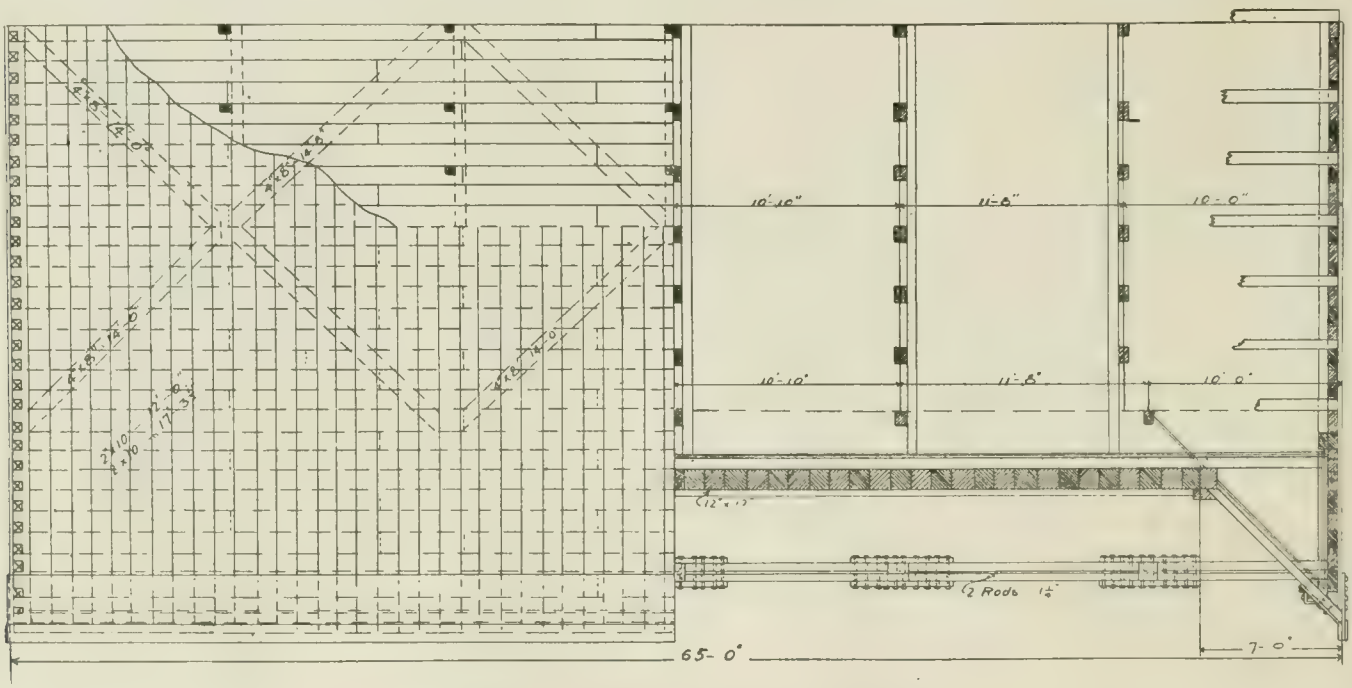

Fig. 1—Caisson for McKinley Bridge, St. Louis, Mo.

of the caisson and its adjustment into exact position, during sinking.

When all was in readiness for the launching, the timber work being only partially placed to reduce the draft required, the planks which held back the skids were sawed, eight or ten teams of sawyers working in unison, so that each skid might be released at the same instant. When but a fraction of an inch of the planks held back the caisson, jacks were tightened to increase the tension until the planks parted and the caisson traveled with rapidly increasing velocity down the ways. Lines fastened to it before launching were used to tow it to position, where each end in turn was lined into exact position by observers placed at the baseline stations on shore.

As soon as the caisson was secured in position, the contractor's fleet was moved alongside. This consisted of a derrick barge, another containing cement storehouse and mixer, and the sand and gravel barges. The greater part of the mixer barge, which was 80x26 ft., was occupied by the cement storehouse, a structure 20x42 ft., and 11 ft. high. A runway led from this to the charging platform, 4½ ft. higher. On a level with the platform was the hopper of the Smith mixer, which dumped into a bucket in a pit built into the hold of the barge, below the level of the deck. The bucket used was a very simple bottom dump affair, capacity 1¼ cu. yds., which was emptied by simply making fast the snatch line and slacking off the fall lines. The concrete used in the foundations was all 1:2½:5 proportion and was mixed so wet that very little

to the proper position of these points, located their correct position on the platform, showing the movement required to bring the caisson to place. By successively determining and correcting position, the caisson was located exactly, after which the air pressure was removed, and the cutting edge allowed to bury itself in the mud.

Sinking was then begun, to provide against movement from position by giving the cutting edge greater penetration. This was accomplished by either the dry or wet blow—the sand being forced out through pipes by the pressure of the compressed air in the chamber. In the dry blow, the sand is simply shoveled against the inlet of the pipe, which sucks it up, while in the wet blow, the end of the hose is kept submerged in a pool of water, piped down from the surface under pressure, and the sand is shoveled into the pool, or sluiced by the hose. In either case the material issues from the pipe at the top of the pier with great velocity, the stream of sand, pebbles and water shooting at times 50 ft. out over the water.

As the caissons sank, daily locations were made by the engineers, from the baseline on shore, and notice given the contractor of the amount of skew in the caisson from the true perpendicular to the bridge line and the distance north or south, or east and west that the caisson was out of its true position. The contractors then resorted to the usual methods of correcting position, such as giving the caisson and pier a lean opposite to the direction in which motion was desired, dredging

Gangs of 15 or 16 sandhogs were used, the hours of work and rates of pay for this as well as the sinking being as follows:

Depth.	Pay.	Shifts.
0- 50...	$2.50 for 8 hrs....	20 min. for lunch, time on Co.
50- 60...	2.75 for 6 hrs. .	3 hrs. on, 3 hrs. off.
60- 70...	3.00 for 4 hrs...	2 hrs. on, 1 hrs. off.
70- 80...	3.25 for 2 hrs...	1 hr. on, 1 hrs. off.
80- 90...	3.50 for 1 hr....	¾ hr. on *
90-100...	3.75 for ¾ hr...	½ hr. on *

Above prices for sinking. For concreting add 25 cts. per day to amount corresponding to depth at which rock was struck.

In the caisson the concrete was shoveled from where it dropped through the material shaft, to the ends of the working chamber, and there placed in layers or benches, built up to within 4 in. of the top of the chamber, and well tamped. The space between the concrete and the roof of the chamber was filled with mortar tightly rammed into place. As the size of the space to work in got smaller the temperature rose, probably due largely to the heat generated by the setting of the green concrete, and it was difficult to keep men in the gangs or get them to work properly. All were stripped to waist and perspiring freely, and took turns at working and refreshing themselves with ice water and the warm air, cool by comparison with the chamber atmosphere, which was pumped in. Some relief was obtained by using electric fans in the chamber and also by pumping

*Takes ¼ hour to equalize in on company time and ¼ to equalize out on own time.

the air through coils of pipe suspended in the river, before it entered the caisson.

After the space under the opening of the material shaft was filled, the concrete was locked down through the main shaft in bags and placed by the one or two men who could find room to work. The shafts were in most cases partially filled in the same way under pressure, while in one case the pressure was taken off and the concrete dumped into the shafts as rapidly as possible, to fill them before the water rose in them, which it did in a very short time, working its way through and around the concrete already placed. The pressure was always held on to allow the concrete to set for 12 hours, to avoid as much as possible any injurious effects of disturbing it after partial setting. Levels taken on top of the piers before and after the air was removed showed that no settlement occurred.

The rate of sinkage of the piers depended on the rate of the masonry construction, character of the material encountered, size of caisson, depth of water and temperature. The average rate, obtained by dividing the total sinkage by the actual number of working days was about 2.0 ft. per 24 hours, the maximum being 7.7 ft. in 24 hours in the case of Pier D. The following table gives the rates of sinkage for all the piers:

Piers	Maximum ft.	Average ft.
I	3.0	1.8
II	3.0	1.0
III	4.0	1.6
IV	4.3	2.1
C	7.3	2.5
D	7.7	4.1

After the piers had been sunk to bedrock and sealed, the remainder of the work of erecting them to their full height proceeded without incident, and without the use of any but ordinary methods and apparatus.

Before commencing work on the detail plans for the new harbor, wet dock and graving dock at Avenmouth, Bristol, England, the material was thoroughly studied upon which the massive works were to be built. Mr. A. D. Swan resident engineer for the work, in a paper read Dec. 16, 1909, before the Canadian Society of Civil Engineers, said that previous to the exact site of the works being finally settled, two cast iron trial cylinders, each 8 ft. in diameter, were sunk, one about the middle of the dock and the other at the entrance channel. By this means the nature of the various strata to be passed through before a rock foundation could be reached was made absolutely certain.

The United States Consul-General at Winnipeg, Man., says concerning the Grand Trunk Pacific, which is being built across the continent by a company under agreement with the Canadian government:

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Cost of Constructing a Macadam Pavement With Concrete Curb and Gutter Manistee, Mich.*

This improvement includes one block and one intersection of street which had been originally improved by the application of 8 to 10 ins. of clay to the roadway. The land where the street is, was a swamp in former years and the subsoil immediately beneath the pavement is swamp sand. The total area between faces of curbs is 1,577.7 sq. yds. The area of concrete gutter 18 ins. wide on each side is 147.7 sq. yds., leaving 1,430 sq. yds. as the net area of macadam roadway. The length of improvement is 440.5 ft. and width between faces of curbs is 30 ft. The width between faces of return curbs at the intersection is 26 ft. The depth of compacted macadam, after rolling, is designed to be 8 ins.

The concrete curb and gutter was built by contract. The combined curb and gutter had the following dimensions. Curb, 6 ins. thick and usually 6 ins. high; gutter, 18 ins. wide and usually 5 ins. thick except at driveways where it is 6 ins. thick. The intersecting curbs are joined with circular sections of 8 ft. radius and the faces of circular curbs are protected by ¼ x 2-in. steel bands 12 ft. long, securely anchored by ¼ x 3½-in. bolts spaced 18 ins. The concrete used was a 1:2:4 screened lake gravel mixture; the finish coat, 1 in. thick, was a 1:2 gravel screenings mixture, the gravel being screened through a ¼-in. mesh. In proportioning, 1 bag of cement was assumed to be 0.9 cu. ft. The gravel cost $1.75 per cu. yd. delivered on the work. The cost of this gutter was as follows:

Item.	Total.
Setting grades (engineering)	$ 18.60
886.2 lin. ft. curb and gutter	332.32
886.2 lin. ft. sub-base 12 ins. thick	8.86
48 lin. ft. steel band	5.76
Total	$365.54

This gives a cost of 41.25 cts. per lin. ft. of curb and gutter completed. There is 0.875 cu. ft. of concrete per lineal foot, so that the cost of concrete work was $332.32 ÷ 28.8 cu. yds. = $11.54 per cu. yd. The cost of concrete curb and gutter alone was $332.32 ÷ 886.2 lin. ft. = 37.5 cts. per lin. ft.

The macadam pavement was constructed by the city by day labor. The work was done under the city surveyor as manager and the street commissioner in direct charge as superintendent. The commissioner was not on the job continually but enough every day to see that the work was properly and well done. The time of men and teams was kept by the street commissioner on blanks for the purpose. One blank was filled out daily by the commissioner (Fig. 1) and every few days the data from these blanks were transferred by clerks to similar larger blanks. The day's work was 10 hrs., for which the men were paid wages ranging from $1.50 to $2 per day, depending upon experience and ability. The city owns two teams, one driver of which receives $1.50 per day and the other, who is also caretaker at the city's barn, receives $45 per month. The labor of these teams is charged to improvements at the rate of $3.50 per day and the "Team Account" is credited with a like amount. All hired teams received $4 per day. Crushed, dolomitic lime stone was delivered on the city's dock for $1.15 per cu. yd., in cargoes of about 700 cu. yds. Each improvement using stone was charged, in addition to the actual cost of the stone, 5 cts. per cu. yd. for dockage. The stone was hauled in common wagons, with dump boards and 20-in. sideboards. The haul was exactly 1¼ miles and all of it over paved streets. The loads were hauled up an 8 per cent grade for the first 200 ft. from the dock, then over practically level streets, slightly ascending, for two blocks, then up a 5 per cent grade for one block, then a 4 per cent grade for another block, making in all a rise of 35 ft. in the first 1,900 ft. From this point to the work, 4,700 ft., the grade was all descending with a total fall of 39 ft.

The costs of the work are first itemized for each class and then the classes are summarized.

Excavation and Grading.—The excavation averaged about 10 ins. deep, or about 1 cu. yd.

*Rearranged from data furnished by Geo. B. Pike, City Surveyor, Manistee, Mich.

Herman Long ..... Labor Account for the 1 t Half, Month of August, 1909 Per Day 1 75

Date	Street Dist's 1 2 3 4 5 6 7	Ramsdell St Pav	Pine St. Hill Ac.	Gen'l St	Gen'l Sew	Arthur St. Pav	River St. Pav	Cleve. St. Pav	Labor Performed.

Fig. 1—Blank for Keeping Daily Records.

for each 3.5 sq. yds., making 410 cu. yds. The items of cost were as follows:

Item.	Total.	Per cu. yd.
Team 7½ dys at $3.50	$ 26.25	
Team 2 dys. at $4	8.00	
Total teams	$ 34.25	$0.083
Labor 25½ dys at $1.75	$ 44.20	
Labor 16¼ dys at $1.50	24.37	
Total labor	$ 68.57	$0.167
Grand total	$102.82	$0.250

The cost per square yard of pavement (net area) was $102.82 ÷ 1,430 sq yds. = $0.0719. The average cost of teams per day was $3.605 and the average cost of labor per day was $1.642.

Hauling and Loading Stone.—A total of 549 cu. yds. of stone were hauled. Of this amount, 528 cu. yds. were used in the macadam proper and 21 cu. yds. were used in the tarvia surfacing. Of the macadam stone, 82 per cent was 1½ to 2½-in. stone and 18 per cent was material ranging from dust to ¾-in. size. The tarvia surface stone was all of the finer material. The cost of loading and hauling this 549 cu. yds. of stone was as follows:

Item.	Total.	Per cu. yd.
Team 53¾ dys. at $3.50	$ 20.12	
Team 26¾ dys. at $4	107.00	
Total team	$127.12	$0.232
Labor 28½ dys. at $1.75	$ 49.90	
Labor 1½ dys. at $2	3.00	
Labor ¼ dy. at $1.50	0.38	
Total labor	$ 53.28	$0.097
Grand total	$180.40	$0.329

It will be seen that 549 cu. yds. of stone were loaded in 30¼ man days, or 18.15 cu. yds. per man per day. The number of loads hauled was 274 so that each load was closely 2 cu. yds. The length of haul was 1¼ miles, so that each team traveled 2½ miles per load or for 274 loads the total distance traveled was 685 miles. There were 32½ team days worked, which gives an average travel of 21.08 miles per team per day. In this work the average cost of teams per day was $3.911 and the average cost of labor was $1.761 per day.

Macadamizing.—The costs of macadam stone and of hauling, grading, rolling and sprinkling were as follows:

Item.	Total.	Per sq. yd.
Material:		
433 cu. yds. stone (1½ to 2½ ins.) at $1.20	$519.60	
95 cu. yds. stone (dust to ¾ in.) at $1.20	114.00	
Total materials	$633.60	$0.4431
Labor:		
Loading and hauling 528 cu. yds.	$173.50	$0.1213
Grading, 34¼ days at $1.75	59.95	
Grading, 3½ days at $1.50	5.25	
Total grading	$ 65.20	$0.0456
Rolling, 8¾ days steam roller at $7	$ 61.25	$0.0428
Sprinkling team 1 day at $4	$ 4.00	$0.0028
Total labor	$303.95	$0.2125
Grand total	$937.55	$0.6556

A total of 528 cu. yds. of stone were used for 1,430 sq. yds. of 8-in. pavement; 528 cu. yds. of loose stone made, therefore, 317.7 cu. yds. of stone compacted, or there were required for each 1 cu. yd. of stone compacted 1.67 cu. yds. of loose stone. The item grading in the above costs includes all labor performed in helping the teamsters unload wagons, spreading stone and screenings and finishing the surface while the roller was working. The steam roller averaged 164 sq. yds. completed per day.

Tarvia Surfacing.—In applying the tarvia, the street was thoroughly cleaned by hand, ordinary bass fiber push brooms being used for this purpose. The stone dust and screenings gathered by these brooms were swept from the center to each side and deposited upon the concrete gutter. Enough more stone, running from dust to ¾-in. size, was hauled and placed upon and along the gutter so that the total amounted to approximately 1½ cu. yds. to every 100 sq. yds. of macadam pavement. The tarvia was heated in a kettle, with fire box underneath, mounted on four wheels, which is so constructed that one or two barrels of tarvia may be placed on top of the kettle and allowed to run slowly into it, while the hot tarvia is being drawn and spread upon the street. The kettle has connection, with valve, for 1½-in. rubber steam hose about 20 ft. long. The tarvia was applied by opening the valve and allowing it to flow from the hose, when it was spread over the pavement with push brooms, using a pulling motion most generally.

The gang was composed of 6 men and 1 boy, to wit: One kettleman, whose duty it was to tend the fire, keep sufficient tarvia in the kettle and work the valve; one hoseman, who held the unconnected end of the hose close to the pavement, and gradually moved it about over the street; two men with brooms spreading the tarvia; two men with brooms cleaning pavement ahead and also spreading a light sprinkling of stone over the tarvia as soon as it was applied, and one boy leading horse that was used to pull the kettle along the street.

After the tarvia was all applied, the entire gang was used to spread screenings and the roller then finished up the work; two men remaining on the street, as long as the roller worked, in order to apply extra screenings as necessary. "Screenings" as here used means stone running from dust to ¾-in. in size.

The cost of the tarvia surfacing was by items as follows:

Tarvia and Fuel:	Total.	Per sq. yd.
New tarvia used, 680 gals. at $0.065	$ 44.21	
Old tarvia used, 35 gals. at $0.065	2.21	
Fuel used in heating tarvia	1.75	
Total	$ 48.17	$0.0337
Tarvia Labor:		
Team labor, ¼ day at $4	$ 1.00	
Hand labor, 3 days at $2	6.00	
Hand labor, 7 days at $1.75	12.25	
Hand labor, 1½ days at $1.50	2.25	
	$ 21.50	
Boy labor, 1 day at $0.50	$ 0.50	
Total	$ 22.00	$0.0154
Tarvia Stone:		
21 cu. yds. (dust to ¾-in. size) at $1.20	$ 25.20	
Labor, loading and hauling stone	6.90	
Total	$ 32.10	$0.0224
Rolling Stone:		
Steam roller, 1½ days at $7.00	$ 10.50	$0.0073
Total cost of tarvia work	$112.77	$0.0788

The amount of tarvia used per square yard of pavement was ½ gal.

Sewer Work, Catch Basin Repairs and Setting Inlets.—In connection with the pavement work proper there were the following items of miscellaneous construction:

Team labor, 1 day at $3.50	$ 3.50
Team labor, ¼ day at $4.00	1.00
	$ 4.50
Hand labor, 4½ days at $2.00	$ 9.00
Hand labor, 11¼ days at $1.75	19.68
Hand labor, ½ day at $1.50	0.75
	$29.43
Cement, brick and castings	$15.80
Grand total	$49.73

Summary.—Summarizing the above costs we have the following costs per square yard of pavement:

Item.	Per sq. yd.
Excavation and grading	$0.072
Crushed stone	0.442
Loading and hauling stone	0.121
Spreading stone	0.046
Rolling macadam	0.043
Sprinkling macadam	0.003
Tarvia surface	0.079
Total	$0.808

These costs do not include anything for use and depreciation of tools and appliances or any charges for superintendence.

Notes On Road and Street Work.

Work of the Municipal Asphalt Plant of San Francisco.—During the seven month period from March 1, 1909, to September 30, 1909, the municipal asphalt plant of San Francisco turned out 151,238 cu. ft. of asphalt binder and 159,750 cu. ft. of asphalt wearing surfaces, a total of 132,266 sq. yds. of asphalt pavement were laid during the period, the detailed cost being as follows:

	Total.	Per sq. yd. pavement.
Material for binder	$ 21,702	$0.164
Material for wearing surface	43,790	.331
Labor at plant	13,622	.103
Plant expenses	5,480	.041
Labor, teams, etc., on street	41,009	.310
Total	$125,603	$0.949

The binder material cost about 14.3 cts. per cu. ft. and the surface material about 21.1 cts. per cu. ft.

Some Costs on Testing Road Materials.—The Bureau of Research of the New York State Commission of Highways has charge of the tests of all materials submitted for use upon the roads constructed in that state. In a preliminary report to the State Legislature a brief resume of the work of the bureau is given and from this we have taken the notes that follow: During the year 330 samples of stone proposed for use on 110 separate roads aggregating approximately 600 miles were tested in the laboratory of the bureau. This material was from all parts of the state and of many different classes of stone. The cost of stone sampling was $8.55 per sample including the cost of collection of each sample. The average time necessary for making tests was five days. The bureau also sampled and tested 2,003 samples of cement representing 20,030 bbls. of cement from a total of 163 lots. The cement was used on 95 roads throughout the state. Forty-eight samples were rejected. The cost of the testing averaged 5 cts. per barrel of cement used. Of bituminous materials 2,640 samples comprising 721 lots were tested: 496 of these lots were of asphalt and road oil representing in round numbers 2,900,000 gals., while 225 lots were of rock asphalt taken from 205 carloads, approximately 8,100 tons. The cost of this sampling was at the rate of $8.05 per lot, or approximately 7¾ cts. per barrel of material represented by the test. Of this, 4 cts. was laboratory work and 3¾ cts. represented the cost of factory sampling and office expenses properly chargeable to this test.

Repairing Asphalt Pavement by the "Heater" Method.—During [illegible] of 1908 the engineer department of the District of Columbia made some tests on repairing and resurfacing asphalt pavements by the Lutz heater system. By the use of a large patented heating machine the old surface is heated through and the upper crust taken off; new asphalt material is then placed on the surface

DETAILS IN REPAIRING ASPHALT PAVEMENT BY THE LUTZ HEATER SYSTEM.

Test No.	Asphalt per load	Cart loads of asphalt	Area in sq. yds. *Total. †Highest.

and rolled. According to the annual report of the engineer commissioner for the last fiscal year good results from the use of this method are being obtained and it is believed that this method of resurfacing will prove more economical than the old method of removing the top surface by cutting out. Through the kindness of Captain E. M. Markham, assistant to the engineer commissioner, District of Columbia, we are enabled to give the accompanying table showing a summary of the details of the work of repairing asphalt pavements by the heater method. The work was paid for by the cubic foot of material furnished and used, measured in carts at the site of the work, the rate being 70 cts. per cu. ft. for asphalt top material and 25 cts. per cu. ft. for asphalt binder. The average thickness given in the table is the thickness before rolling. All the streets repaired were sheet asphalt, except 18th street, which was asphalt block. In the work a total of 397½ cart loads of asphalt top surface at $20.58 per load, and two cart loads of binder at $6.45 per load were used.

Concrete Road Construction in Wayne County, Michigan, with Some Data on the Cost.

Wayne County, Michigan, now has a little over 1¾ miles of concrete roadway, and it is stated to be giving such excellent satisfaction that the county commissioners propose building eight or ten additional miles during the coming summer.

The first concrete roadway of the county was constructed on the Woodward Ave. road. This road is in the suburbs of the city of Detroit and is subjected to a very heavy traffic. The roadway was laid in two courses, 24 ft. in its narrowest width, the concrete portion being 8 ft. wide and 6½ ins. deep. The first course was made of 1—2½—5 Portland cement, sand and limestone, 4 ins. deep, and the second course of a 1-2-3 mix of Portland cement, sand and crushed cobblestones, 2½ ins. deep. It was in 25-ft. sections. Several kinds of experimental joints were used in the construction of this road. Two thicknesses of 3-ply tar paper were used in some sections, a southern pine ½ in. thick was used in other sections, a composition of asphalt, still wax and pitch was tried in still other sections, and in other sections the edges were protected by an angle iron embedded in the concrete and filled in with the above composition. The section was one mile long and was constructed by contract, the contract price being $10,200.70. The total cost of the road was as follows:

Concrete, contract	$10,200.70
Open ditch, labor	153.05
Tile drain, labor	376.62
Tile drain, material	312.41
Inspection, building shoulders and all other items	2,494.81
Total cost	$13,537.59

Last year a section of concrete roadway 2,652 ft. long was constructed on the Wayne road south by day labor by the Board of County Road Commissioners. Wayne road south is one of the main highways into the village of Wayne, a place of about 2,000 population, situated about 18 miles from the city of Detroit. The subsoil on which the concrete roadway was built is a light, sandy mixture. The road was built 16 ft. over all, 10 ft. being of concrete, the shoulders abutting up to it being a combination of gravel and limestone. The accompanying cut shows a cross section of the road.

A 1—2—4 mixture was used, the concrete begin put down 10 ft. wide and 6 ins. deep. Washed pebbles over ¼ in. in size and passing through a 1½-in. mesh were used. Expansion joints ¼ in. thick of 3-ply tar paper were put in every 26 ft. The surface of the road was finished rough and gives good traction to both horses and motor vehicles.

The cost of the concrete roadway proper was $3,214.41, or $1.09 per square yard. This is at the rate of about $6,400 per mile for a 6-in. concrete roadway 10 ft. wide. The above cost does not include the costs of drainage, building the shoulders, nor grading.

The labor cost of the work was $1,327.43, or about 45 cts. per square yard. This includes the cost of a night and a day watchman for two weeks after the concreting was finished.

The cost of the concrete materials was as follows:

Washed pebbles, 658 tons at 99 cts.	$ 651.42
Sand, 375 tons at 71 cts.	270.75
Cement, 781 bbls. at 99 cts.	773.19
Total concrete materials	$1,704.33

The price for concrete materials is f. o. b. the road commission's siding. The average length of haul was ½ mile. In addition $100 was paid for the rental of a concrete mixer.

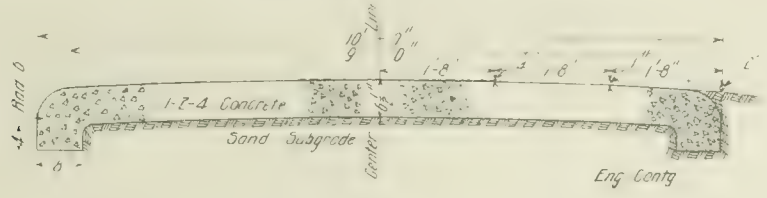
The wages paid on the work per 9-hour day were as follows:

Subforeman	$3
Watchmen	2
Laborers	2
Teams	4

The members of the Board of County Road Commissioners and the engineer superintended the work. The common labor was largely incompetent, the work being done outside of a small town, and there being no idle men available. The men were brought out from Detroit, being recruited largely from the free employment bureau in that city.

Weather conditions were very unfavorable, the road being constructed late in the fall, necessitating the use of hot water in the mixing of the concrete. Gravel and sand also had to be thawed out every morning before being available for use. Heavy and continuous rains delayed the work for several days, so that, while the road was actually built in 12 days' time, 18 days really elapsed between the time of starting and finishing, which necessitated the payment of watchmen for the extra time consumed. There was also an extra expense for covering the work with straw and manure.

We are indebted to Wm. Murdock, member of the Board of County Road Commissioners of Wayne County, for the above information.



Section of Concrete Road, Wayne County, Indiana.

The Maintenance of Dirt Roads.

Of the total mileage of roads in this country over 90 per cent are the ordinary dirt road and this type of road will for many years continue to be the practical form of construction throughout all sections of the country. In an address before the Cornell Society of Civil Engineers, Mr. Charles H. Hoyt, superintendent of road construction, U. S. office of public roads, discussed the dirt roads as follows:

A word about the long abused dirt road, and by dirt road let me explain that I mean the ordinary country roads that have been built and worked by town officials for the past centuries through any kind of material that happened to be encountered from sods, gravel, sand, boulders, clay, soil or mud.

The dirt road is a good road so long as it is dry, smooth and hard—three conditions that we do not get all at once for very long periods of time. It is beyond the province of man to say when it shall rain or when it shall not rain; therefore, to a certain degree it is not possible for us to keep an earth road dry.

It is possible for us, however, to put our earth roads in such locations and to build them of such cross-section, and to build ditches and culverts of such design as will keep the water away from the road as much as possible.

The great trouble with miles and miles of earth roads throughout this country is (I don't know just how to express it unless I say) the stupidity of their location and their care. I would like to repeat that the great trouble with miles and miles of earth roads throughout this country is the stupidity of their location and their care.

You just look at a poor stretch of earth road and you will often find that it is lower than the surrounding land on either side. That is, the road is a natural ditch, built by man, for acres and acres of surrounding land. Water that falls in the road cannot get out except by evaporation or soaking into the ground, and just as much lower as the road is than the adjoining land, it is just so much nearer the ground water line and therefore more wet. The water from the adjoining land runs or sinks into the road and stays there until it dries out.

Do you wonder that the road is muddy, spongy and soft, and that an empty wagon is about all that a team can draw over a road that is in this condition for various lengths of time throughout the year? Another condition is when the road dries hard, the ruts are deep and the road is rough. This rough condition often occurs in the fall of the year when the road freezes after a muddy spell.

Suppose these ruts had been leveled off with a split-log drag before the road baked or froze hard. Then the road would have been smooth and hard and in good condition for a time. The split-log drag is a very simple affair; costs about $2 to build, is economical to use, and every farmer or teamster living along a country road, who is interested in having the road past his place kept in good condition and is also interested to keep highway taxes down, should have a split-log drag.

Suppose that every such farmer or teamster had one of these drags and would drag the road in front of his own property after each rain or when ruts had formed. It might take him from one-half hour to an hour occasionally throughout the season. After the road has once been built in proper shape it is surprising how good the road may be kept by using split-log drags as suggested.

Now, the practical lesson of all this is—study the drainage of your road; keep the water away from it by ditches and culverts, and don't look just in the road. Study the surrounding land and turn the water away from the road before it gets into the road. Open up ditches for hundreds of feet away from the road, if necessary.

Grade your roads up higher than the adjoining ground. Keep the center of the road 6 to 8 ins. higher than the sides, and from 1 to 2 ft. higher than the side ditches, so that the water will run from the road to the side ditches and then along the road in the side ditches and not in the road. Give the dirt road a chance with intelligent care and it will surprise you.

It is an easy matter to talk about our country roads, and no one appreciates more keenly than I do, the difficulties and the responsibilities that our town highway officials have been struggling with during the past years. We must recognize conditions as they exist and meet them in a practical way, otherwise our talking will do no good. The average amount appropriated for repairing country roads in the United States is about $37 per mile. This is not enough, especially if it is worked out by day labor. There may be places where less than $37 per mile will do very well, but there are a great many places where $37 per mile is not sufficient. It is useless for us to talk about better roads unless necessary funds and skilled supervision are provided.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Results Achieved in Reducing Consumption of Water in Washington, D. C.

In ENGINEERING-CONTRACTING for Dec. 22, 1909, some data were given on the reduction in per capita consumption of water in Washington, D. C., taken from the report on the filtration plant. The report of the superintendent of the Water Department for the year ending June 30, 1909, gives some very interesting information on the matter and shows how the savings were made.

The reduction in water supplied amounted to 13 gals per capita, the total mean daily consumption being reduced from 64,500,000 gals. to 61,200,000 gals. with a population increase of 6,000. These gratifying results are attributed to three causes: The location and stoppage of underground leaks, careful house to house inspection, and increased use of meters.

During the year underground leaks and illegitimate use of water were discovered and corrected, aggregating a flow of 9,551,000 gallons a day. On a diagram accompanying the report the population line from 1896 to date is almost straight. The per capita consumption increased very slightly from 1896 to 1900, the line representing it meeting the population line, showing the ratio increase in per capita consumption to be decreasing. The total consumption ratio increased rapidly to 1898, from which date it was parallel with the per capita consumption until 1900, after which date both lines rapidly parted from the population line, but remained parallel until 1904. In 1900 the population in round numbers was 283,000, the per capita consumption was about 172 gals. daily and the total daily supply was approximately 49,000,000 gals.

In 1904 the population was 309,000, an increase of about 9 per cent. The per capita consumption was 201 gals., which, taking the 9 per cent population increase into account, was a per capita increase of nearly 30 per cent. The total daily consumption was 63,000,000 gals., an increase of nearly 30 per cent. In 1904 the local inspection work commenced to increase in efficiency so that the per capita consumption remained practically constant, although the population continued to increase, which brought the per capita line and the population line closer together, while the total consumption line paralleled the population line. In 1906-7 a fund became available for a systematic underground survey for leaks as well as for the general installation of meters. From this point the per capita and total consumption lines drop sharply, while the population line increases at a practically constant rate. In 1908-9 the per capita consumption has dropped to 178 gals. and the total daily consumption to 61,200,000 gals.

Had the use of water continued to increase at the rate which prevailed from 1900 to 1904, the present daily average rate would be about 81,000,000 gals. instead of about 61,000,000, with a per capita of 235 instead of 178. In the absence of special preventive and corrective measures there is no reason to doubt that the rate would have so increased, especially as available water pressures throughout the district average more than 100 per cent higher than in 1896. (The foregoing statement is made by the superintendent, but he fails to state how much of the increase in pressure is due to stoppage of leaks. It has been found in all waste and leak surveys that an increase in pressure is one of the first results noticed after waste is stopped.—Eds.) A mean daily rate for the year of 81,000,000 gallons would mean a maximum daily rate during cold weather of about 125,000,000 gallons, the capacity of the present conduit being only 90,000,000 gallons.

A division of tests and experiments has been established. The work of this division was shown in the increased economic efficiency of the pumping station. The "station duty" secured averaged 95,600,000 ft. lbs. of work for each 100 lbs. of coal burned, an increase of 17.7 per cent over the duty obtained during the preceding year. This represents an annual saving of 643 gross tons of coal and there is every indication that there will be a still further improvement.

It is interesting to note that 14 per cent of the entire flow is supplied to the District of Columbia. This being the case it would appear that the per capita supply is not so great after all when comoared with other cities. The question naturally comes up as to accounting methods in American cities. Assuming that 14 per cent of a total daily supply is put to public uses and 40 per cent to leakage and preventable waste due to incompetence or inefficiency of officials in charge, or due to parsimony of the men who apportion funds so that officials in charge cannot do their work propertly, how much water is actually used per capita? In reporting per capita consumption is it figured alike in all cities as the total daily consumption divided by the population or do some officials first deduct water used for public purposes?

There were 1,555 leaks repaired, evidence of which appeared on the surface of the ground, and these were in addition to leaks found by the underground survey. Only 41 of these leaks were on trunk mains, the remainder being on service lines.

The underground survey found the most fruitful source of underground waste was in the service pipes, although the leaks on the mains represented a large percentage of the total amount, 5,214,015 gals. per day being chargeable to service pipes and 1,750,120 gals. to the mains. On the services the two principal causes of leakage were corrosion of black iron pipe, wiped joints or lead services and lead connections on iron services. Defective wiped joints were generally due to inferior workmanship and a number of cases were found in which the condition of the pipe indicated an overheating during the process of wiping. It might be generally stated that leaks on service pipes usually occur through inferior material or inferior workmanship, two things that may be guarded against by proper inspection.

Damage due to settlement was confined almost entirely to the iron pipes, lead services being rarely affected by this condition, and in the few exceptions the breaks were at the joints. The effect on the iron pipe was the fracture both laterally and longitudinally along the seam. Of the leaks on the mains more than 50 per cent of the waste was through the calked joints. This condition was due to the poor workmanship on the old mains (an insufficient quantity of lead having been used), to unequal settlement of the pipes and to the vibration of mains caused by their proximity to street car tracks. An open 3 inch sewer blow off valve was found and closed, the waste amounting to 737,000 gals. per day. As this valve was unrecorded, the waste might have continued indefinitely. A number of unrecorded mains and valves were discovered on the underground survey, so the indirect benefit was large.

The total waste found and prevented amounted to 9,560,634 gals. per day, nearly 16 per cent of the present total daily supply. This figure represents only the leaks radically cured, leaking fixtures and leaks where permanent repairs were impossible are not included. Leaks in this latter class, composed principally of defective house and yard fixtures, were referred to the water registrar's office for disposition. In this connection it is of interest to note that of 27,758 houses inspected, 4,621, or over 16 per cent, were found with defective fixtures. Special attention was given to the cutting off of abandoned water services at the tap in the main, thus eliminating a continual source of trouble from leakage due to old pipes. During the year 1,032 services of this kind were cut off. On page 354, Vol. XXXII (1909), of ENGINEERING-CONTRACTING this point was discussed in connection with the Chicago water waste survey. It was found that the custom generally was to hammer the ends of the lead service pipes instead of turning off the water at the main. In Boston also (p. 495, Vol. XXXII, ENGINEERING-CONTRACTING) these old imperfectly closed house services were found to be a great source of loss.

The value of the common house meter as a protection to the consumer is well shown in Washington. If an abnormal use of water is indicated by the meter in large houses where considerable water is used, the occupant is notified by card to that effect and the case is dropped. If the consumption is found to be excessive in medium sized houses a notice is sent to that effect. If after a reasonable time no change is observed an examination is made and if leaks are found the occupant is again notified that if this condition is allowed to continue large bills will naturally result.

A third class of houses consists of small houses which are generally occupied by irresponsible parties. In such cases where an extraordinary wastage of water is found the supply is discontinued after one notice has been served. In the first two classes of houses the owners cooperate promptly with the water department as a rule, but the principal waste is traced to the occupants of the small houses and considerable trouble is experienced. The report gives the case of one house to illustrate the efficiency of this system of supervision. The registration of the meter in a small house indicated an extraordinary consumption since last reading, and on examination of the premises a hydrant was found running nearly full head, in addition to other leaks of a minor character. Notices were served on both occupant and agent and the water promptly cut off. Had this wastage been allowed to continue to the end of the year, 5,721,970 gals. of water would have been consumed (based on the actual meter measurement) and the bill would have amounted to $228.88. In many instances several leaks were found on one service by means of the meter. In some cases as many as six repairs have been made in as many months. In no way can such conditions be controlled except by meter, without great expense; and then, too, the fact that all water that passes through the meter must be paid for is an enormous factor in bringing about speedy repairs and a reasonable use of water. In a majority of houses that pay in excess of the annual minimum rate, leaks have been found which were only remedied after a warning from the water department, and the bill for excess has been rendered. It is safe to say that all leaks in those premises hereafter will receive the prompt attention of the occupants.

The following shows the average cost of installing a meter:

Meter	$ 8.50
Material	5.00
Labor	2.44
Total	$15.94

The force engaged in installation is as follows: A man in charge, who also has charge of taking out and resetting meters for test and repairs, and repairs to service pipes; therefore only half of his time and the cost of the horse and wagon used by him is properly chargeable to installation. In addition to the man in charge the force consists of 1 plumber, 5 laborers, 1 2-horse wagon and 1 1-horse wagon.

Relative Cost of Municipal Work Done by Day Labor and Contract.*

BY HARRISON P. EDDY.†

Among the various lines of investigation carried out by the late Boston Finance Commission were several which threw considerable light upon the relative efficiency of the contract and day-labor systems and some of the causes of the inefficiency of the day-labor forces of the city of Boston. An effort was made to ascertain as nearly as possible the actual facts in all cases, and to reduce the conditions to figures, thus eliminating opinions. The results of these investigations are, therefore, interesting and important, as showing the results of conditions surrounding city departments, and not as exploiting theories of ideal conditions which are rarely found in any city. While most of the data refer to the city of Boston, it is believed that the lessons drawn from them are typical, and that similar results would be obtained from like investigations in many other cities.

Relative Prevalence of Contract and Day-Labor Systems.—In order to ascertain the general municipal practice throughout the country in building water works and sewerage systems, a postal-card inquiry was sent to all cities in Massachusetts, and to all cities in the country exceeding 30,000 in population, as shown by the Census Bureau in 1905. The results of this inquiry appear in Tables I and II. The questions were so worded as to apply only to ordinary extensions, and it is probable that in some cases work upon new systems may have been done by contract, while ordinary extensions were made by day-labor.

Postals were sent to 154 cities, and replies relating to sewerage systems were received from 73 cities, and relating to water works extensions from 58 cities.

Of the 73 cities making replies to the inquiries relating to sewerage systems 52 or 71 per cent were found to be doing this class of work wholly by contract. Of the cities located outside of New England 94 per cent were found to be doing their work by contract, while but 67 per cent of the cities in New England outside of Massachusetts were using this system, and in Massachusetts only 6 per cent. The prevalence of the day-labor system in Massachusetts is very strikingly shown by these figures, which it should be noted, are based upon replies from all of the 18 cities to which inquiries were sent. Putting it in another way, of the 18 cities in Massachusetts 1 was doing its sewer work wholly by contract, while 17 were doing similar work wholly by day labor.

Replies to the inquiries relating to water works extensions were received from 58 cities, and of this number 33 per cent were found to be doing the work wholly by contract. Outside of New England 48 per cent of the cities have adopted the contract system, while in Massachusetts of the 15 cities making reply to the inquiries all were found to be doing the work by day labor. The results of the inquiries relating to water pipe extensions are very similar to those relating to sewer construction, and both show very clearly that the day-labor system is very widely adopted in Massachusetts, and is much more prevalent in that state and in New England than throughout the remainder of the country.

Comparative Costs of Day-Labor and Contract Sewer Work in Various Cities.—A comparison was made of the cost of building sewers in cities where work was known to be done by day labor with that in other cities where similar work is done by contract. These comparisons were confined to New England cities, and very largely to cities in Massachusetts.

To make this investigation less difficult and reduce the element of uncertainty as much as possible, the inquiry was confined to small pipe sewers from 8 ins. to 12 ins. in diameter. Since most sewers of this class built in Boston have been constructed under contracts (largely "gift" or non-competitive contracts), the number available for comparison was smaller than was desired. As the difficulty in selecting work done under comparable conditions was fully realized, and as such selection could only be made by engineers familiar with local conditions, an assistant was sent from place to place to interview the local engineers, who always very kindly, and at times at considerable inconvenience to themselves, carefully considered the conditions surrounding a large number of pieces of work, and advised which should be selected for use in this comparison. The number of sewers selected in each city was small, but included all which could be classed as being built under conditions enabling fair comparison within the last few years. While it is realized that this study may be criticized as being based upon fragmentary and possibly insufficient data, it is presented as comprising the best data which could be obtained after a long and earnest effort to get at the truth. Unfortunately, in no city except Boston was this class of work found to be done both by day-labor and by contract, so that comparisons between the two methods in the same city were impossible, with the single exception noted. The results are shown by Table III.

These investigations were made in 17 cities, 13 of which do their work by day-labor (including Boston which does part of its work by day-labor and part by contract), and 5 (including Boston) which do the work by contract. The average cost of building 12-in. sewers in 12 cities was found to be $2.17 per lin. ft., while in the city of Boston similar work appeared to cost $5.20 per lin. ft. Like work done by contract was found to cost on the average $1.82 in four cities, while in Boston it cost $2.35. The average cost of labor and teaming in cities, exclusive of Boston, where the work was done by day-labor, was $1.34 per lin. ft., while in the four cities doing work by contract this cost averaged $0.75 per lin. ft., while upon that done by contract it was $3.50 per lin. ft., while upon that done by contract it was $1.05 per foot, a reduction of 70 per cent.

In Tables IV and V the cost of labor upon small sewers built by day-labor and by contract has been tabulated after being reduced to a uniform basis of wages of $0.315 per hour, the rate paid in Boston.

Reduced to this basis, it appears that the cost of sewers built by day-labor (not including Boston) averaged for labor $1.79 per lin. ft., while in the cities doing work by contract (excluding Boston) the average cost of labor was $1.17. Treating in the same manner similar work done in Boston by day-labor and by contract, it is found that the labor cost was $3.50 and $1.32 per lin. ft., respectively. It, therefore, appears that had the rate of wages been uniform in all cities the labor cost of the work done by contract would have been 35 per cent less than the labor cost of that done by day-labor, not including Boston in this comparison. Comparing the work done by both methods in the city of Boston, it appears that had the work done by day-labor been done by advertised contract the reduction in the cost of labor would have amounted to over 62 per cent.

Comparative Cost of Sewers Built by Day-Labor and by Contract in Boston.—The costs of eight pairs of sewers, so selected as to be as nearly comparable with each other as possible, have been compiled in Table VI. In each pair one sewer was built by day-labor, and one by contract. The pairs were selected by engineers employed by the city, who had direct personal knowledge of the conditions under which the work was done. After re-

Somerville	8"	1.75	2.05	0.90	0.91	*0.24
Average	...	.....	$1.82	$0.75	$0.86	$0.21
Boston	12"	$2.35	$2.35	†$1.05	$0.90	$0.40

*Engineering and inspection.
†Advertised contracts only.
Note—That no correction has been applied on account of difference in wages.
Note—That the day-labor cost shown in Column 4 includes labor on manholes, whereas the contract labor does not include this, but does include loss on sheeting, which substantially offsets it.

**Engineering estimated $0.08 per ft.
**Exclusive of office and shop charges as in other cities.
†Owing to the fact that this figure is based upon a comparatively small number of examples, it should be used with caution.
‡Not including proportion of undivided construction cost, which amounts to about 5% of total construction cost.

ducing the costs to equal terms as to size, depth and wages, it appears that in the case most favorable to day-labor the cost of the sewer built by direct labor was nearly double that of the one built by contract, while in the case of the pair most favorable to the contract system the one built by day-labor cost nearly four times as much as the one built by contract.

The Relative Cost of Cleaning Catch-Basins by Day-Labor and by Contract. A study was made of the cost of cleaning catch-basins by day-labor and by contract. This study included the cost of cleaning nearly 9,000 catch-basins at a total expense of over $54,000. The cost of doing this work by day-labor averaged $6.39 per catch-basin, or $2.47 per cu. yd. of refuse removed from the basins, while that done by contract cost $4.15 per basin, or $1.46 per cu. yd.

Relative Cost of Manufacturing Valves by the Boston Water Department Shops and Purchasing the same by Contract.—For many years the Boston Water Department has maintained a shop for repairs and the manufacture of a portion of the gate valves, hydrants and smaller fittings required for construction purposes. The business of the shop amounted in 1907 to $14,000. A comparison of the cost of manufacturing valves with the cost of the same if purchased by contract showed an increased cost under the day-labor system varying from 6 per cent to 60 per cent., as follows:

Valves, ins.	Per cent.
3	36
4	60
6	53½
8	47½
12	41½
16	10
18	12
20	6

Under stress of these investigations and simply by the automatic stimulus of them, the cost of labor upon these gates was reduced about 35 per cent.

Decrease in Efficiency of Labor Force in Boston Water Department.—The city engineer of Boston has for many years kept a careful record of the cost of trench work done in connection with the laying of certain classes of water pipe. The results of this tabulation are shown by Fig. 1. The upper line beginning in 1878 shows the cost per foot for labor upon trench work for pipe up to 12 ins. in diameter. In this compilation the engineers have carefully excluded all work done under unusual conditions, so that the figures are as nearly as possible comparable from year to year. The lower line indicates the same costs reduced to a uniform basis of wages and hours of labor. It will be noticed that during the first two years the cost per foot was a little over $0.20, and during 1905 it was about $0.88. The cost, after reducing to a uniform basis of 10 hours per day and a wage of $2, was of course increased during the periods when the employes were receiving $1.75 per day, and decreased during the latter years when the hours of labor and wages were less than 60 hours per week, and more than $2 per day respectively, and shows accurately the relative efficiency of the labor from year to year.

These data have been used in producing an efficiency curve, Fig. 2, by averaging the unit costs for the first 15 years during which period there was no marked tendency either up or down (1880 to 1895), and assuming that that average represents an efficiency of 100 per cent. Stating the premises in another way, the average number of feet of pipe laid for $1 during those 15 years represents an efficiency of 100 per cent. The variation from year to year is shown by the dotted line and the averaging for 15 years (100 per cent) as well as the curve showing the general tendency from 1895 to 1907 by the heavy line. Beginning in 1895, it will be noticed that the line of efficiency fell gradually until it reached 50 per cent in 1907.

From all the information available, it appears that this study of cost and efficiency is based upon very full and reliable data, and that comparison from year to year can be fairly made, although of course a better and safer result may be obtained by averaging several years, and making a comparison on that basis. In whatever manner the comparisons are made, it is apparent that the efficiency of the day-labor force has dropped about 50 per cent in the last 12 years. In other words, in 1907 the average employe did only one-half as much work in a given length of time as he did in 1895. In this connection it should be remembered that there are many causes for this decline in efficiency, some of which are entirely independent of the personal effort of the laborers, and for which they should not be held in any way responsible. It is also true that this decline is not necessarily an inherent result of the operation of the day-labor system, and that system has been in use in other cities for many years, where a decline of such proportions is not apparent.

It is also interesting to note that the cost of work (Fig. 2) was reduced by including with the work by day-labor also that done by contract during the years 1904-7.

Efficiency of Labor and Rate of Wages Paid.—An effort was made to ascertain the prevailing rate of wages paid by contractors in the vicinity of Boston for work similar

TABLE IV.—COST OF LABOR, TEAMING AND ENGINEERING UPON SMALL SEWERS BUILT BY DAY LABOR.

(Labor costs reduced to uniform basis of $0.315 per hour, as paid in Boston. Data reduced to uniform basis of 12-in. pipe laid 10 ft. deep.)

City or Town.	Cost of labor per ft., inc. teaming and engineering, but not office and shop charges.	Nominal wage per day of eight hours.	Actual hourly rate of wages per hr. for common labor.	Cost per ft. of labor inc. teaming reduced to comparable basis (rate $0.315 per hour).	Cost of teaming per foot.	Cost of engineering per foot.

*Estimated.
†Direct teaming only. 10 per cent has one horse and wagon.
**Not including proportion of undivided construction expenses, which amount to about 5% of total construction cost. Furthermore, owing to the fact that this figure is based upon a comparatively small number of groups, it should be used with caution.

to that performed by the city water and sewer departments. Data were obtained from 35 different contractors.

The minimum rate of wages paid in this vicinity appears to be $0.15 per hour, and the city departments, and consequently they do not give continuous employment.

Inquiries were sent to sewer departments of all the cities in Massachusetts and several of the larger cities of the other New England

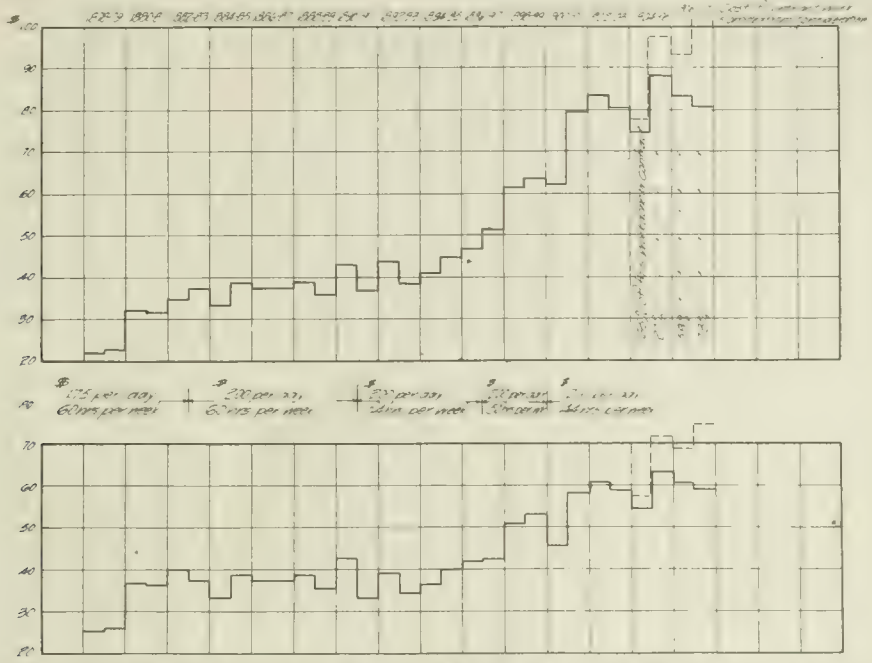

Fig. 1—Diagram Showing Cost of Trench Work in Laying Mains Up to 12 ins. Diameter.

(All work involving special difficulties omitted. Upper table shows actual cost. Lower table shows what cost would have been if a uniform wage of $2.00 and a uniform working day of 10 hours had prevailed throughout the entire period.)

the maximum did not exceed in any case $0.30 per hour. Comparatively few laborers are employed at rates of pay exceeding $0.25 per hour, while large numbers are paid as low as $0.20. In general, it may be stated that English speaking laborers are paid more than others, and further that the rate of $0.30 applies quite generally to building laborers or to laborers who possess rather more than average skill. In no case was it found that laborers were paid for legal holidays, and only in two instances were Saturday afternoons allowed. None of the contractors gave Saturday afternoons off with continued pay, and in no case were laborers paid in event of absence from work on account of injuries received.

The contractors furnishing data do not "carry" their employes through the winter unless they have work which must be done. In other words, they do not "find" work for their laborers during the winter season as do states, to ascertain the length of day and the rate of wages in force upon municipal sewer work in the city departments. The data thus collected is compiled in Table VII. Several of the cities included in this inquiry performed their construction work by contract, so that the figures given in those cases apply only to the maintenance forces. From these data it appears that the prevailing length of day is 8 hours, although in some cases a 9-hour day is required. Excluding Boston, the nominal rate of pay varies from $0.17 to $0.287 per hour, while the prevailing rate of pay may fairly be said to not exceed $0.25 per hour. In about one-third of the cities the laborers are permitted to have half holidays on Saturday, although in about one-half of these cases the half holidays are restricted to the summer months. In several of the cities where half holidays are granted th length of day is so arranged that the laborers work 48 hours during the week. In five cities granting Saturday half holidays laborers are paid in full for Saturdays during the summer months (varying from two to six months).

From a comparison of the wages paid by contractors and by municipalities, it is evident that city laborers are paid considerably more than laborers employed by contractors and that they work fewer hours per week. It is difficult to determine the relation existing between high wages and the efficiency of the employees. It is doubtless true, however, that higher wages are paid by municipalities very largely because of political influence.

In this connection it is very interesting to note the increase in wages paid for common labor in the city of Boston from 1878 to 1907. From 1878 to 1883 the wages paid were $1.75, and the length of day was 10 hours. In 1883 the rate of wages was increased to $2 per day. In 1891 the length of day was reduced to 9 hours, and in 1897 Saturday half holidays were allowed *with pay*. In 1900 the 8-hour day was granted, together with the continuance of the Saturday half holiday, and in 1907 with the same hours the rate of wages was increased to $2.25. It therefore appears that between 1878 and 1907 the rate of wages had increased from $1.75 to $2.25 per day or 28 per cent, and the hours of work had been reduced 26⅔ per cent. The result of reducing the length of day and increasing the rate of pay is made more apparent by comparing the rate of compensation per hour as in Table VIII.

From this table it appears that the hourly wage, making due allowance for the Saturday afternoons and holidays, has increased from $0.175 to $0.315, an increase of 80 per cent, in the cost to the city for the work done, assuming equal efficiency. In this connection it should be noted that while the cost of labor to the city has increased 80 per cent per hour, the increase in daily wages received by employees has amounted to but 28 per cent.

It is further important to note that while the cost per hour to the city for labor has increased 80 per cent, the efficiency of labor, as already shown, has fallen 50 per cent. In other words, a dollar's worth of time in 1878 would today cost the city $1.80, but the efficiency having dropped 50 per cent the city is obliged to pay $3.60 for the amount of work done in 1878 for $1, an increase of 360 per cent.

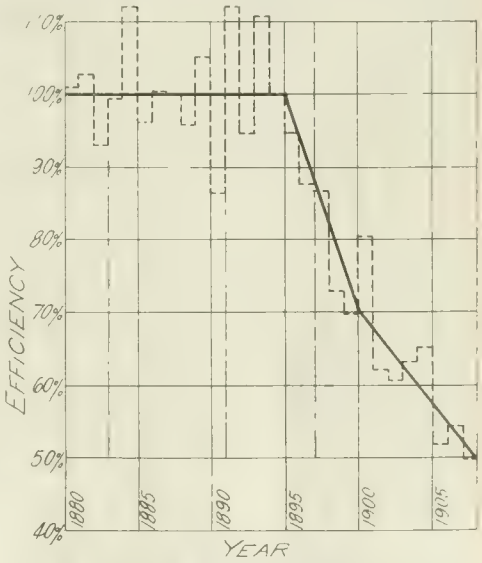

Fig. 2—Diagram Showing Efficiency of Labor in Boston Water Department.

(The average efficiency for the 15 years, 1880-1894, has been taken as 100 per cent. Data for this diagram have been reduced to a uniform basis of wages and hours for the entire period.)

It would not seem unreasonable to expect that some relation may exist between the rate of wages paid and the efficiency of labor,—

TABLE V.—COST OF LABOR, TEAMING AND ENGINEERING UPON SMALL SEWERS BUILT BY CONTRACT.

(Labor costs reduced to uniform basis of $0.315 per hour as paid in Boston. Data reduced to a uniform basis of 12-in. pipe laid 10 ft. deep.)

*Rush job.

Note—These pieces of work were picked out by the District Engineers as substantially comparable. Lineal foot costs are based on total cost of labor, teaming, explosives and supplies, excluding engineering and administration, office and yard department, cost of materials—i. e., pipe, brick, cement, manhole covers and steps. In each comparison the lineal foot costs are reduced to terms of like diameter of sewers and like average depth of trench.

or in other words that enough more work would be done per hour under the higher wages and shorter hours so that at least as many feet of sewer would be laid for $1 as in cases where lower rates of wages prevailed. The following tabulation made up from Table IV shows the number of feet of sewer laid for $1 when the wages are reduced to a uniform basis of calculation. The percentage of efficiency is calculated on the assumption that the Brocton labor was 100 per cent efficient.

While it may not be fair to draw the conclusion from these figures that labor is less efficient *because* of higher wages, it does seem to follow that higher compensation does not *assure* greater efficiency. The greatest efficiency was apparently obtained in the case of the city of Brockton where the nominal wage is $2.25 per day, although in Boston, where the same nominal wage is paid and holidays granted in sufficient number to increase the rate per hour over 12 per cent, the lowest efficiency was indicated. Averaging the results obtained in cities paying the same rate of wages, there appears to be a gradual decrease in efficiency as the rate of pay increases.

Holidays and Sick-Leave.—The effect of political influence is shown very clearly in the granting of holidays and sick-leave with pay to city laborers. The cost of holidays, half-holidays and sick-leave is an item, the magnitude of which is not very generally appreciated. The Boston Water Department has very carefully compiled statistics relating to this source of expense. During 1906 the distribution division expended upon pay-rolls about $450,000, and the amount charged to holidays, half-holidays and sick-leave amounted to over $34,000, or 7.7 per cent of the total pay-roll. The lowest percentage for any month was 5.3, and the highest was a little over 10 per cent of the respective pay-rolls.

During the first eight months of 1907 the money paid for holidays and sick-leave amounted to 8.3 per cent of the total cost of labor. During this entire period of 20 months, the pay-rolls amounted to $752,000, and nearly $60,000, or 7.95 per cent of the amount of the

*Allowance made for legal holidays for which full pay is allowed.

pay-rolls, was expended for holidays and sick-leave.

Age of Laborers.—Perhaps one of the most frequent criticisms by the public of day-labor departments, is that the men employed are too old for the work they are required to do, and consequently that the amount of work done per man per day is ridicuously small. This appears to be the universal opinion, and unfortunately in many cases there is much to substantiate it. An investigation of the Boston Sewer Department furnishes considerable interesting information pertinent to this criticism. Of the employes of this department, the investigation included 715 connected with the labor service. The ages of the various employes, as well as their terms of service, were obtained from the State Civil Service records, and are classified in Tables X and XI.

TABLE X.—LABOR EMPLOYED IN BOSTON SEWER DEPARTMENT CLASSIFIED ACCORDING TO AGE.

75-79	2	0.3	75- 2	75- 0.3	32.0	40	24

Note—Investigation made in 1907.

Considering these tables as of the date of their preparation (1907), it is found that of the 65 men who were from 60 to 64 years of age, four had seen less than 5 years of service in the department; six had seen from 5 to 9 years' service; 20 between 10 and 14 years; 28 between 15 and 19 years; *and only seven had served the department 20 years or more.* Of the 21 men from 65 to 69 years of age, two had worked less than 5 years; two others from 5 to 9 years; six from 10 to 15 years; five from 15 to 20 years; *and only six had been employed in the department 20 years or more.* Of the 9 men from 70 to 74 years old, two had labored from 10 to 14 years; four from 15 to 19 years, and *three only for 20 years or more.* There was one man over 75 years of age and he had labored *40 years or more for the department.* Sixty-one (9 per cent) of the 715 employes had worked 20 years or more. *There were 97 employes over 60 years of age but only 18 of them (18.5 per cent) had served the department for 20 years or more.*

Many will maintain, and with much justice, that men who have worked for the city for 20 years are entitled to consideration, but from the following statement of facts it appears that few are in need of charity. Of the 56 men who were over 40 years of age, and who had served 20 years, 9 were employed as watchmen, which work they could perfectly well do. Four were filling position for which they were not suited, and three were filling absolutely useless position, leaving 40 men out of 56 men who were performing laborious work. Stating this matter in a different way, it appears that out of 715 laborers there were only 16 who were 40 years of age or older, who had served the city 20 years, and who were incapacitated for laborious work, and of these 16, nine were able to serve as watchmen. This condition leads to doubt as to the necessity for establishing a pension system for the labor force unless such system is to be established for the benefit of employes who have passed their years of usefulness in the service of other employers, and who have late in life received probably through political influence, positions upon city work.

The policy of appointing men upon the labor service after they have passed their years of usefulness in the service of other employers had turned the department into a semi-charitable institution, where aged and infirm men were employed when they should have been the charges of relatives or of the public, and not placed upon the city pay-rolls at wages higher than first-class able-bodied laborers at similar work could command from other employers.

Experiment to Test the Efficiency of the Day-Labor Force.—All of the work upon which the previous comparisons and comments as to efficiency have been made was work done prior to the investigations which were consequently studies of records of work already completed. It was not, therefore, possible to know accurately the conditions under which the work was done. At the request of the Mayor of Boston a test was made at the Chestnut Hill stone-crusher (a municipal plant which had been shut down) to determine whether or not it was possible for the day-labor force to produce broken stone at a cost fairly comparable with that of similar stone purchased by contract. The test covered a period of three months during the summer of 1908, and was under the observation of a disinterested engineer, who kept accurate record of what was done, but who did not in any way supervise or direct the forces. The work consisted of stripping and quarrying the stone, hauling it to the crusher and breaking it.

The test lasted a sufficient length of time to demonstrate with accuracy the cost of producing broken stone by day-labor under the existing conditions. The force consisted of men apparently as skillful and competent as could be selected from the employes of the Street Department, and certainly gave evidence of being reasonably skillful and competent. So far as could be observed, the foreman in charge was given an absolutely free hand to organize his force as he deemed best, and to adopt such methods of handling the work as he might desire. With slight and unimportant exceptions, tools and supplies were promptly furnished, so that there is no reason to think that the output could have been increased by the improvement of conditions depending upon the co-operation of the superior officers of the department. The net result of this test appears to be that broken stone was produced at a cost of $1.075 per ton. These figures make no allowance for the cost of clerical service at the office or for the cost of administration, which items are estimated at $0.05 per ton; and no allowance was made for the cost of the quarry. Depreciation of plant and the rental of tools were included in the cost of producing the stone.

The quarry and crusher selected were the most favorable of any of the eight which the city had worked in the past, and in 1895 produced broken stone more cheaply than any other of the city crushers. It is only fair to add that during the second and third periods of the tests, the time being divided into three periods, there was a marked increase in the efficiency of the force. A fair estimate of the cost of the output of broken stone during these latter periods was $0.95 to $1 per ton, no allowance being made for administration nor for owning and maintaining of the quarry. For comparison, an instance was found where the operations of a large broken stone company were started with certain temporary machinery, which was rented to a contractor, who crushed stone for a period of four or five months. The physical conditions were fairly comparable with those at the Chestnut Hill plant. The crusher was similar, the output was smaller, and rental was paid for the machinery. The cost to the contractor for this work was $0.45 per ton, not including interest and depreciation, which would bring the cost up to $0.50 per ton. It therefore seems fair to conclude that the work which cost the city practically $1.12 per ton, including administration expense, would have cost a competent contractor about $0.50 per ton. It should be borne in mind that this does not include any profit upon the work.

Resumé.—The foregoing discussion of a small proportion of the studies made under the direction of the late Finance Commission is very brief, for many of the studies required months of work. For the full reports, 59 in number, made by Metcalf & Eddy, reference may be made to Volume III of the report of the Boston Finance Commission.

While the difficulties of such investigations are many, it is believed that the results recorded represent very conservatively the conditions existing. It is apparent that municipal work done by day labor is in general, under the conditions of today, much more expensive than similar work done under the same conditions by contract. It is also apparent that the labor force in city departments where work is done by the day labor system, is very inefficient as compared with similar forces employed by contractors and has, during the last 10 or 15 years decreased greatly in efficiency, at least in the city of Boston.

There are many causes of the excessive cost of day labor work and of the inefficiency of the day labor forces, all of which may be grouped under the one great evil—the entrance of politics into municipal business. These causes include abnormal rates of pay, the granting of holidays and half-holidays, the employment of aged and physically incompetent laborers, absence of discipline, a lack of incentive, and the inexperience of those in executive positions. It would further appear that the number of men growing old in the service of the city, who were at the time of their original employment young and vigorous, is not a material cause of inefficiency. On the other hand, the employment of men in city departments who have passed their years of usefulness in the service of other parties, has a demoralizing effect upon the labor forces and has undoubtedly been the cause of much of the inefficiency noted in municipal day-labor forces.

Average Cost of Laying Water Mains at Washington, D. C.—The following table rearranged from the report of the Engineer Department of the District of Columbia for the last fiscal year, shows the average cost per lineal foot for laying water mains of various sizes (including repairs to improved pavements) during the year ending Jun 30, 1909:

Size.	3 in.	4 in.	6 in.	8 in.	12 in.
Lineal feet laid..	919	1,281	586	58,200	5,135
Cost of labor per lin. ft.....	$0.377	$0.423	$0.485	$0.386	$0.600
Materials, per lin. ft.	.401	.588	.601	.910	1.480
Repairs to pavements per lin. ft. .	.441	.328	.097	.037	.137
Total ...	$1.219	$1.339	$1.183	$1.333	$2.217

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Methods and Cost of Constructing a Concrete Lock and Timber Crib Dam With Appurtenant Structures Employing Day Labor.

I.

The following figures give the itemized unit costs of excavation, timber crib, mass concrete, riprapping, grading, filling and building work in constructing a concrete lock and timber crib dam involving a total expenditure of $288,072.

Several years ago the United States Government began the construction of a series of locks and dams for the improvement of the Upper White River from Batesville to Buffalo Shoals in Arkansas. The project aimed to secure slack water navigation, giving 4 ft. depth, between the two places, a distance of 69 miles, by means of 10 fixed timber dams, with concrete locks, having an average lift of 14½ ft. The construction of the first lock and dam of the project was described in ENGINEERING CONTRACTING for May 6, 1908. Complete costs of the work as well as drawings of the lock, dam and minor structures were given in this article. The construction of the second lock and dam is described in the present article, the descriptive matter being taken from the report of Maj. Graham D. Fitch, corps of engineers, as given in the annual report of the chief of Engineers, U. S. A., for 1904, and the cost data being compiled from the personal records of Maj. Fitch which were loaned to us for that purpose. The general plan of the lock and dam was similar for both structures; the dam reached straight across the river and the lock was located at one end.

CONCRETE LOCK.

Lock No. 2 is located 7.8 miles above Batesville, Ark., in a straight reach of the river where there was ample spillway, but where the foundations were unusually deep and the bed of the river was covered with large boulders. No better location could be found, however, though two surveys were made for the purpose. The lock chamber is 175 ft. long between hollow quoins and 36 ft. wide; the lift is 14 ft. The depth of water on the lower miter sill is 5 ft. The lock is founded on sandstone bed rock, crib cofferdams being used to lay dry the foundation site. This type of cofferdam was used mainly because the foundation bed afforded no hold for piles, but incidentally the further advantage resulted of permitting excavation closer to the dam walls.

Construction of Cofferdam.—The cofferdam cribs were constructed of 10x10-in. x 20-ft. timbers. The end sections of the dam were built and sunk in place, but the sides were built four timbers high on barges, then launched, towed to the site and the building continued. During the building 2x12-in. plank were spiked over the openings between timbers of the outer wall; after the crib was sunk double lap vertical sheeting of 1-in. boards was driven along the inner wall and spiked to the timbers as far down as the water would permit. A sump hole was located at one of the upper corners of the pit. At this place there was no beam, the material standing almost vertical; elsewhere a beam of 6 ft. was left. There were 480 lin. ft. of 14x19-ft. cofferdam and its cost was as follows:

Materials.	Per unit.	Total.	Per lin. ft. of dam.
Timber [illegible]	[illegible]	[illegible]	[illegible]
182.9 m. ft. B. M. timber	[illegible]	[illegible]	[illegible]
41.5 m. ft. B. M. timber	[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]	[illegible]
Labor.			
Towing 165.6 m. ft. B. M timber	$ 1.94	$ 323	$0.67
Handling and storing 165.6 m. ft. B. M.	4.33	717	1.49
Inspecting 165.6 m. ft. B. M.	0.51	85	0.18
Framing and placing 165.6 m. ft. B. M.	4.65	1,044	2.18
Total labor		$2,169	$4.51
Grand total		$4,428	$9.21

Counting in the lumber not charged for, we have 224.4 M. ft. B. M. and at a total cost in place of $4,428, or $19.73 per M. ft. B. M. If we figure the 41.5 M. ft. B. M. old lumber not charged for as worth half price, the cost of lumber in place was $20.78. Adding the cost of puddling and pumping to the above, we have:

Item.	Total.	Per lin. ft. of dam.
Timberwork	$4,428	$ 9.21
8,723 cu. yds. puddling at 46 cts.	3,976	8.29
Pumping pits (labor)	175	0.36
Preparing foundations (labor on bridge)	91	0.19
Total	$8,670	$18.05

The itemized cost of puddling was as follows:

Digging (8,723 cu. yds.).	Per unit.	Total.	Per lin. ft. of dam.
Labor	$0.05	$ 460	$0.96
Fuel and oil		123	0.25
Towing (2,250 cu. yds.).			
Fuel		30	0.06
Labor on towboat	0.56	127	0.26
Unloading Puddle.			
Labor unloading	0.354	3,080	6.42
Miscellaneous labor		156	0.33
Total (8,723 cu. yds.)	$0.46	$3,976	$8.28

Some of the labor items can be summarized as follows so as to show the amount of work done per man per day:

	Work done.	Labor time in days.	Work done per man-day.
Handling and storing timber	165.6 m. ft.	384	0.43 m. ft.
Inspecting timber	165.6 m. ft.	30	5.50 m. ft.
Framing and placing timber	224.4 m. ft.	545	0.41 m. ft.
Digging puddle	8,723 cu. yds.	215¾	40 cu. yds.
Unloading puddle	8,723 cu. yds.	1,678	523 cu. yds.

Excavation for Lock Foundation.—In excavating for the lock foundation a 1¼ cu. yd. Bucyrus dipper dredge was used to remove from the bottom, before the cofferdam was closed, such material as it could handle, but owing to the large boulders encountered most of the excavating had to be done by hand after the cofferdam had been pumped out, the material—clay, boulders and cemented gravel—being removed by wheelbarrows and derrick skips. The lock wall foundations averaged 12 ft. in depth with a maximum depth of 13 ft. In excavating for the land wall of the lock which was at the foot of a sliding bank, the excavation was made in sections about 20 ft. in length, and each section filled with concrete before excavating for the next section. As both the chambers at miter walls are founded on bed rock no water can penetrate into the chambers from below, and no excavation was necessary below the elevation for the lock floor which is the natural surface of the ground. The excavation for the lock foundations required the removal of 3,304 cu. yds. of earth and 2,280 cu. yds. of rock and hard pan. The cost was as follows:

Material.	Total.	Per cu. yd.
Fuel	$ 217	$0.039
Dynamite, fuse and caps	148	0.026
Labor	8,601	1.540
Total	$8,966	$1.605

The labor time in days was 4.624⅛ and as 5,587 cu. yds. were excavated the output per man per day was 1.21 cu. yds.

Forms for Concrete Work for Lock.—The forms consisted of horizontal lagging of 2x12-in. plank dressed on all four sides, held by 4x6-in. studs spaced 4 ft. apart and supported at 8-ft. vertical intervals by 4x6-in. inclined braces. Yellow pine was used. The posts and braces were erected complete before concreting was begun and about half-way up the wall horizontal struts were fastened between opposite studs to brace them apart and also to support a track for dump cars. The lagging was erected gradually as the forms were filled; when the concreting reached the horizontal struts they were removed and the track was raised and supported on cross-wall timbers resting on top of the studs. The forms were left in place four or five days after concreting was completed. The cost of the formwork was as follows:

Materials.	Unit Cost.	Total.	Per cu. yd. conc
150.2 m. ft. B. M. lumber	$15.61	$2,345	$0.199
97.6 m. ft. B. M. lumber (no charge)	....	....	....
Nails, bolts, etc.	....	98	0.008
Fuel	....	50	0.004
Total materials	....	$2,493	$0.211
Labor			
Hauling 76.2 m. ft. lumber 8 mi.	$ 2.90	$ 221	$0.018
Towing 84.1 m. ft. lumber	2.44	205	0.018
Handling and storing 84.1 m. ft. lumber	4.39	370	0.031
Inspecting 126.9 m. ft. lumber	0.53	68	0.006
Erec. and rem'v'l 247.8 m. ft. lumber	15.80	3,918	0.331
Total labor	....	$4,782	$0.404
Grand total	....	$7,275	$0.615

As 247,800 ft. B. M. of lumber was used for the forms the cost per 1,000 ft. B. M. was $29.35, A further analysis of some of the items shows the following:

Item.	Work done.	Labor time days.	Work done per man per day.
Handling and storing lumber, m. ft.	84.1	198	0.425
Inspecting lumber, m. ft.	126.9	24	5.300
Erect. and removal of forms, m. ft.	247.8	1,863	0.133

Concrete Work.—The concrete mixer was a 4-ft. cubical box of ½-in. rivetted steel securely fastened at diagonally opposite corners to a 3-in. steel shaft bored for about half its length with a 1-in. hole for the admission of water. Near one corner was a 15x20-in. hinged door for charging and discharging the batch. The mixer was operated by a 6x7-in. center crank engine. It was located on the bank approximately opposite the center of the lock. About 40 ft. from the mixer on the downstream side was a bin 100x16 ft. x 14 ft. high with two 50-ft. compartments, one for stone and one for gravel. A trestle incline 200 ft. long ran from the top of the bin to the river whence the gravel received on barges was hauled in side dump cars of 2½ cu. yds. capacity to the top of the gravel bin by a double-cylinder, single-drum hoisting engine on the bin. The total length of track on trestle and bin was 310 ft., of which 128 ft. at the lower end was double track. An elevated roadway on the land side of the stone bin enabled the stone to be shoveled from wagons directly into the bin, and an extension of the roadway toward the mixer allowed the sand to be unloaded within a few feet of the sand hopper platform at the upstream end of the bin. A track was laid beneath the bin and the hopper platform and then up an incline trestle 48 ft. long to the top of the mixer, the total length of the track being 167 ft. The required amount of stone or gravel having been fed through steel doors into a bottom dump car, it was pushed to beneath the hopper for sand and cement and then pulled up the incline to the mixer by a single-cylinder, single-drum hoisting engine located on the upstream side of the mixer. Steam for the various engines was supplied by a 50 hp. boiler located on the land side of the mixer. An incline trestle with track connected the mixer with tracks laid along and above the site of each lock wall as described above and after mixing, each charge was emptied into a bottom dump car and dumped where needed.

For the concrete Lehigh Portland cement only was used; the cement varied in price from $1.82 to $2.70 per barrel delivered in cars at Birds Point, Mo. It was transported thence over a land grant railway as far as Newport, Ark., and from that point to Batesville; the freight charges per barrel was 11 cts. From Batesville the cement was towed to the work

at a further cost of about 26 cts. per barrel.

The sand for the work was taken from the White River in the vicinity of the work. The sand cost $1.25 per cu. yd. delivered at the lock.

The gravel used was dredged by hand labor from the river near the work. It consisted of a mixture of pebbles of all sizes with about 19 per cent sand. It did not require washing. The voids were from 17 to 21 per cent. The gravel cost delivered in the bins about 25 cts. per cu. yd.

The stone was limestone from a quarry in the vicinity of the work. It cost $2 per cu. yd., broken to pass a 2-in. ring. The voids averaged 51 per cent. The stone was required to be screened, but it is stated that run of crusher would have been preferable.

The composition of the concrete was carefully determined, the materials being measured loose. Each mixer batch was composed of the ingredients shown by Table I:

TABLE I—PROPORTIONS FOR CONCRETE USED IN LOCK WORK.

Crushed stone concrete.	Cu. ft.	Proportion.
Added water (average)	2.88	..
Cement (Lehigh Portland)	4.19	1.00
Sand (wet)	12.00	2.88
Stone (wet)	25.00	5.97
Total	41.19	..
Gravel concrete.		
Added water (average)	2.00	..
Cement (Lehigh Portland)	4.19	1.00
Sand, direct, wet, 4.50; sand in gravel, wet 4.75 (19 per cent of 25 cu. ft.)	9.25	2.21
Gravel	23.00	5.56
Total	38.44	..

From each of these mixtures was secured approximately 1 cu. yd. of concrete in place.

The mixer was revolved 15 times at an average speed of 11 revolutions per minute. The minimum number of batches mixed per hour was 12 and the maximum 23, the average number being 15. Work was carried on for 16 hours in two shifts of 8 hours each. The minimum amount of concrete placed in eight hours was 95 cu. yds. and the maximum 184, the average amount for the season, including boulders, being 140 cu. yds. The concrete, which was wet, quaking mixture, was placed in even layers of 6 ins., and tamped with a 25-lb. tamper until water appeared on the surface. The gravel core was kept as near up with the crushed stone outside as possible, generally within 15 ft. The maximum drop of the concrete was about 15 ft. The walls being sufficiently thick to permit of their use, boulders of from 1 to 50 cu. ft. in size were placed in the concrete, care being taken to lay each stone on its largest base and never at a less distance than 1 ft. from another boulder or from an exposed surface. The concrete was sufficiently wet to prevent the formation of voids. The total concrete in the lock is 11,824 cu. yds., of which boulders constitute 549 cu. yds. A facing 1 to 3 mortar, 1½ ins. thick, was placed on the sides, and of 1 to 2 mortar, 2 ins. thick, on the top of the walls. The facing templates were of dressed plank 6 or 8 ins. wide, 2 ins. thick on the top edge and 1¼ ins. thick on the bottom edge. They were provided with eyebolts for lifting.

The inside edges of the coping of the land and river walls sharp were rounded off not only to prevent chafing of the mooring lines, but also on account of the liability of chipping.

The itemized cost of the cement delivered at the work was as follows:

Materials.	Unit.	Total.
11,293 bbls. cement	$1.92	$21,762
140 bbls. natural cement	0.80	112
Rent of warehouse	....	15
Total		$21,889
Labor		
Hauling 181 bbls. 8 mi.	$0.429	$ 78
Loading 11,293 bbls. on barges	0.039	440
Towing 11,293 bbls. 8 mi.	0.100	1,183
Storing 11,293 bbls. at lock	0.090	980
Testing	0.027	316
Total	$0.676	$ 2,997
Grand total 11,433 bbls.		$24,886

This makes the cost of the concrete delivered on the work about $2.17 per bbl.

The sand, as previously stated, cost $1.25 per cu. yd. A total of 3,170 cu. yds. was secured at a total cost of $3,804, or $1.20 per cu. yd.; the additional 5 cts. was for inspection.

The itemized cost of the crushed stone was:

Item.	Unit.	Total.	Per cu. yd.
3,505 cu. yds. stone	$1.98	$6,940	$1.980
Inspecting 3,505 cu. yds.	0.28	101	0.028
One-half cost of bins	..	165	0.047
Elevated wagon road	..	129	0.036
Total	..	$7,335	$2.091

The cost of quarrying riprap and of boulders for the concrete was $252 for 549 cu. yds., or 46 cts. per cu. yd.

The itemized cost of the gravel was as follows:

Dredging (Orange Peel).	Total.	Per cu. yd.
Fuel and oil	$ 480	$0.071
Labor	666	0.096
Total (6,940 cu. yds.)	$1,146	$0.170
Hoisting to Bin.		
Fuel, etc.	$ 111	$0.020
Hoisting	1,921	0.270
Total (6,940 cu. yds.)	$2,032	$0.290
Miscellaneous Items.		
One-half cost bin	$ 165	$0.023
Incline to river	335	0.048
Building dump cars (3)	110	0.016
Sundry items	94	0.013
Total	$ 704	$0.100
Grand total	$3,882	$0.560

The itemized cost for materials and labor for mixing and placing concrete in the lock was as follows:

Material.	Unit.	Total.	Per cu. yds.
11,373 bbls. cement	$ 2.17	$24,886	$2.104
8 bbls. cement for finishing work	3.00	24	0.002
3,170 cu. yds. sand	1.25	3,978	0.337
3,505 cu. yds. crushed stone	2.09	7,335	0.620
549 cu. yds. riprap and boulders	0.46	252	0.021
6,940 cu. yds. gravel	0.56	3,883	0.328
Fuel	....	504	0.043
1,030 gals. oil for Wells Light	0.13	136	0.011
Miscellaneous supplies	....	119	0.010
Total materials	....	$41,117	$3.456
Labor.			
Inclines, tracks, car rep., etc.	.....	$ 1,076	$0.091
3 bottom dump cars	$32.22	97	0.008
Mixer frame, etc.	.....	97	0.008
Mixing and transporting	0.623	7,369	0.623
Tamping	0.222	2,625	0.222
Finishing top of walls	.....	130	0.011
Dressing face of walls	.....	136	0.011
Total labor	.....	$11,529	$0.974
Grand total (11,824 cu. yds.)	.....	52,646	4.43

The labor time for tamping was 1,461½ days, making 8.9 cu. yds. tamped per man per day. Table II shows the proportions of concrete and boulders in different portions of the lock.

TABLE II.—SHOWING RELATIVE PROPORTIONS OF CONCRETE AND BOULDERS IN LOCK.

	Below foundation. C.Y. conc.	Below foundation. Boul.	Below foundation. C.Y. conc.	Below foundation. Boul.	Total C. Y. conc.	Total C. Y. Boul.

Leaving of mixed concrete						11,275

The height of the lock walls is 15 ft. above the upper miter sill, 29 ft. above the lower sill, and 30 ft. above the lock floor. Being founded on solid rock, each wall acts separately and the design is that of a retaining wall. The land wall is slightly stronger than the river wall, but its top is narrower; opposite the chamber it is stepped in the rear with 1-ft. affects every 3 ft. 6 ins. while the river wall is battered. Both walls are 14 ft. 6 ins. thick at bottom; at top the thickness of the river wall is 6 ft. and of the land wall 4 ft. 9 ins. The ends of the lock walls are necessarily thicker than the side walls of the chamber, as they must not only support the pressure from the gates, but also provide work room for the lock tenders, and the thickness of the lock walls at the heels of the gates is accordingly 16 ft. The walls are, in conformity with the usual practice, without batter inside, though battered walls have been recommended because vertical walls in course of time receive unsightly scars from the rubbing of boats against them. The available length of the lock chamber is 147 feet. The length of the wall below the lower quoin is 25 ft. and above the upper quoin 37 ft. The total length of the lock is 237 ft.

The hollow quoins are shaped directly in the concrete, a form being used as for any other special surface. The shape is that of an arc of the same radius as the heel of the gate, namely, 10 ins.; they are 110° in length, with tangents at either end 6 ins. long. The gate recesses are 22 ft. long and 2 ft. deep.

The miter walls are without batter. Part of the lower miter wall is prolonged downstream to the lower end of the lock so as to protect the tail bay from being scoured out by the discharge from the culverts.

The upper coffer wall, the function of which is to support a simple movable dam across the head of the lock when the upper gates or valves need repairing, has its sill 1 ft. below the upper miter sill. In coffering the head bay this sill forms the lower support for the needles used, the top support being a trussed beam, the ends of which rest in slots in the main walls at such an elevation that the trussed beam will be as low as possible without being immersed at ordinary low-water stages. A similar arrangement of slot and sill is provided for coffering the tail bay.

With the object of preventing the water from cutting behind the land wall, its upper and lower end is provided with a wing wall running perpendicularly back into the bank far enough to join the rocky bluff which is from 20 to 30 ft. in the rear. The thickness of these walls is 4 ft. 9 ins. on top, increasing downward by offsets until rock foundation is reached.

Culverts and Valves.—There are two filling culverts each 3 ft. 3 ins. by 7 ft., which are placed in the gate recesses to keep them from filling with mud; these culverts discharge into a large cross culvert in the upper miter wall and thence through eight small lateral openings into the lock chamber, thus dividing the water into small streams emptying near the lock floor so as to cause little disturbance to boats.

For emptying the lock there are two side culverts, each 4x5 ft., which pass around the heels of the lower gates entering near the gate recesses and discharging below the miter wall into the tail bay, thus serving to prevent deposits there.

The valves are in the culverts, and are butterfly or balanced valves of steel plates and angles turning on vertical shafts.

There are two valves to each filling culvert because the valves had to be of low height in order to remain submerged during low water. They are 3 ft. 2 in. by 3 ft. 2 in. in size, though ordinarily the height would be somewhat greater than the width. The wicket is set in a cast-iron frame bolted to the concrete and is protected from debris by a movable screen sliding vertically in guides bolted to the wall. The valves are inexpensive, simple in design, and that they leak is of no consequence, as the minimum discharge of the upper White River is 1,200 cu. ft. per second.

The valve operating gear, which is set in a covered recess in the coping, consists of a gear sector keyed to the top of the valve shaft

and geared with a pinion turned by a socket wrench and wheel. This simple gearing answers well for the filling valves, which can be operated by one man, but two men were required in opening the emptying valves, so that when one of the valve shafts broke the operating gear for all of the emptying valves was altered by increasing the diameter of the valve shaft from 2 3/16 in. to 3 5/16 in. and by adding two gear wheels and pinions so as to increase the velocity ratio between the first driving pinion and the sector.

The time of complete lockage is 13½ minutes for downstream boats and 14 minutes for upstream boats, to which figures should be added one minute for passing in and out between the guide cribs.

The cost of the valves, ladders, etc., was as follows:

Original valves:	Total.
20,722 lbs. iron	$1,128
Towing 15,667 lbs. iron	20
Total	$1,148
247½ days' labor	567
Grand total	$1,715
Cofferdam for new gear and shafts for lower valves:	
10.5 M. ft. B. M. timber at $8.38	$ 88
600 lbs. iron at 2.15 cts.	13
Fuel	13
Total	$ 114
257½ day's labor	504
Grand total	$ 618
Removing mud from lock pits, setting valves, etc.	
Materials:	
New shafts and gear	$ 495
Miscellaneous	61
Total	$ 556
Labor:	
Pumping and cleaning pit	$ 337
Setting valves	95
Total	$ 432
Grand total	988
Grand total for valves	$3,320

Lock Gates and Sills.—The gates are of the standard form, namely, mitering gates of the girder type with straight front and back. Though timber gates have a shorter life than metal ones and their buoyancy when submerged is a disadvantage, yet owing to their smaller first cost, greater ease of repair and simpler construction, small gates are almost invariably made of wood, which was the material adopted in this case. The gates are horizontally framed and without quoin or miter posts, the main timbers extending from edge to edge of the gate and the ends, which are built up solid with filling blocks, being shaped to fit the hollow quoin and miter, respectively, thus avoiding the weakness of beams jointed into vertical heel and toe posts. The rise is a compromise, the less the rise the greater the thrust upon the masonry, the greater the rise the longer the gate, and hence the longer the lock. In this case the rise was taken as one-sixth of the span, which is equivalent to a miter angle of 18 degrees 26 minutes, though usually the miter angle is taken between 19 degrees and 21 degrees.

The gates are of white oak, 20 ins. thick throughout, each arm consisting of a built-up beam composed of two 10 by 10 in. timbers bolted together with 1-in. bolts and extending in one length from toe to heel. The tops of the gates are flush with the tops of the lock walls, so that the lock can be used until the walls are submerged. The lower gates, which are 29 ft. 5 ins. in height, are built solid for 10 ft. from the bottom. For the upper gates these figures become 15 ft. 5 ins. and 20 ins., respectively. By making the lower portion of a gate solid, the gate may be made thinner, thus reducing under pressure. The upper portions of the gates are paneled; the arms are all made of the same scantling as below, but are spaced inversely as the maximum loads; the arms are separated by five blocks (including the two at the heel and toe), and the intervals are closed with a sheathing of 2-in. oak plank made water tight by calking. The beams are held together by seven pairs of long 1⅛-in. bolts running vertically through the center lines of the main timbers as well as through the filling blocks in the upper part of the gate. The weight of the gate is taken up by two diagonal tie straps of 3½ by ¾ in. wrought-iron eyebars provided with turnbuckles; one end of each eyebar passes over a pin in the journal strap and the other over a similar pin held in place near the lower end of the toe by a stirrup strap and a nose strap. The bottom beam is fitted at the quoin with a cast-iron heel piece which rests on a forged steel pivot shrunk into a cast-iron pivot plate having sufficient bearing. This bedplate is bolted to the concrete. The top gudgeon is a 3-in. steel pin supported at both ends by journal castings, between which the collar works. In order that the leaf may, in opening and closing, swing clear of the quoin without friction, the rotation axis of the pivot and gudgeon is on the upstream side of the center of figure of the hollow quoin when the leaf is closed, the eccentricity being 1¾ ins. The upstream half of the toe is rounded off so that the surface of contact when the gates are mitered shall fall upon the downstream timbers of the built-up beams. Thus the compression due to the end reactions is thrown on the downstream timbers where it will relieve the tension from the direct loading, and is removed entirely from the upstream timbers to avoid increasing the compression from the direct loading.

The anchorage for the gates consists of four wrought-iron bars with cast-iron washers or anchor plates embedded in the concrete and connected in pairs at their exposed ends to a wrought-iron forging, to which the ends of the wrought-iron gudgeon strap or collar are fastened, the gudgeon pin being held in place by two cast-iron plates worked into the gate timbers. This arrangement was difficult to fit and the design for Lock No. 5 provides for two embedded bars with slotted ends for gib and cotter connection with the gudgeon strap. For the double-plate arrangement used at Lock No. 2 for holding the pin was substituted a cast-steel headpiece or bonnet. The anchorage connections fit in a recess below the coping and are covered with a cast-iron plate.

The method of building and placing the lock gates was as follows: A small hand-power derrick was erected on a level spot and so as to command the ways, which were built of long heavy timbers laid perfectly level about 2½ ft. from the ground and close enough together to support without deflection the weight of an entire gate. On each side of the derrick were placed two sets of ways, between which ran a track for carrying the timbers. The gate timbers were delivered as needed to the derrick and placed on the ways, the built-up beams framed and bolted, and the heel and toe worked to pattern. The arms and blocks were then juxtaposed in position so as to get the alignment of the long bolts and then separated for the holes to be bored. This was a tedious procedure, as no matter how carefully the measurements for the holes were made, it was found impossible to bore all of them in the different pieces so as to avoid slight errors of alignment, hence burning the holes out with long rods of hot iron had to be resorted to. The gate was then assembled, the bolts inserted and tightened, the irons fitted on, the heel and toe worked to pattern, and each arm and block numbered to avoid any displacement later. The gates were then taken apart and transported to the lock pit to be erected piece by piece, by means of derrick boat. As each beam was put into position its top was given a heavy coat of white lead, and the position of its bolt holes tested by thrusting down an iron rod. After the gate had been thus built up to the required height, the long perpendicular bolts were raised by the derrick and put into place, the various irons, fitted, the anchor bars and tie straps tightened, and the gate swung. The gates were then given two coats of red lead.

The gates are operated by hand power. The maneuvering gear consists of a spar, to each end of which is fastened one end of a chain; the hight of this chain is led through a chain guide consisting of two sheaves to a chain capstan worked by a crank. The gate is opened or closed according as the chain is pulled in one direction or the other.

As wooden lock gates subject to varying lifts, unless made too heavy at low water, are too buoyant at high water, it is necessary at the approach of floods to ballast them, which was done by filling the panels with large stones.

The miter sills, which provide an elastic cushion for the bottom of the gates, consist of 12 by 12-in. timbers well bolted to the miter wall, as they may sometimes be subjected to a lifting pressure from the gates, and when once started the upward water pressure is of course added. The miter sills are 2 ins. higher than the miter walls so as to act as a guard for the masonry. The miter sills are 1 ft. below normal 4-ft. depth so as to permit the pool level to be reduced without affecting navigation. The sills, like the gates, are of white oak and were set when the concrete was placed in the miter walls. The gates do not, when shut, extend over the sill, as is sometimes the case, for a difficult joint then becomes necessary. In this instance the gates lap the sill by 5 ins., the under pressure being counterbalanced by the weight of the gates. The cost of the gates and sills was as follows:

Materials:	Total.	Per M. ft.
40.4 M. ft. lumber at $17.13	$ 692	$ 17.280
24,351 lbs. grate irons at 4.96 cts.	1,208	21.900
Gas pipe	3	0.080
Pattern material	4	0.100
Fuel	50	1.237
Paint, oils, etc.	102	2.525
Miscellaneous	42	1.039
Total materials	$2.101	$ 44.161
Labor.		
Unloading lumber	$ 12	$ 0.297
Towing 9.5 M. ft. timber at $3.09	29	0.717
Handling and storing 9.5 M. ft. timber	23	0.569
Inspecting 14.6 M. ft. timber at 51 cts.	7	0.174
Framing 40.4 M. ft. timber at $55.68	2,249	55.668
Towing 15,666 lbs. grate irons at 0.12 cts.	20	0.495
Placing gates, 40.4 M. ft. at $22.90	925	22.096
Yard derrick	65	0.569
Total labor	$3.330	$ 81.385
Grand total		125.546

Filling and Paving Behind Land Wall.—Loose stone was placed by hand back of the land wall to form a drain for the seepage. This drain, which was about 2 ft. by 3 ft. in cross section, connected with a 6-in. cast-iron pipe leading through the lower end of the land wall into the guide crib. The space behind the land wall and between the wing walls was then filled with gravel. The cost of the fill behind the land wall was as follows:

Dredging gravel.	Total.	Per cu. yd.
Fuel and oils	$155	$0.03
Labor on dredge	354	0.07
Total (4,856 cu. yds.)	$509	$0.100
Building inclines to bins.		
Lumber and iron	$ 44	$0.009
Labor erecting and removing	381	0.078
Total	$425	$0.087
Hoisting to bins.		
Fuel and oil	$ 60	$0.02
Labor hoisting	866	0.17
Total	$926	$0.190
Grand total		$0.377

The cost of paving behind the land wall was as follows:

Materials.	Total.	Per sq.yd.
479 cu yds. riprap at 70 cts	$ 336	$0.235
Labor.		
Inspecting riprap	$ 14	$0.010
Dressing riprap	328	0.229
Laying pavement	691	0.482
Total	$1,369	$0.956

In connection with the work a ban revetment was constructed below the lock, the cost of this being as follows:

Item.	Unit.	Total.	Per lin. ft.
Labor grading bank (575 cu. yds.)	$0.37	$ 213	$1.06
Paving bank:			
881 cu. yds. riprap	$0.70	$ 616	$3.08
Labor inspecting (881 cu. yds.)	0.03	25	0.12
Labor paving (881 cu. yds.)		367	1.83
Total		$1,221	$6.09

The cost of the paving proper was $1.15 per cu. yd. An average of 4.61 cu. yds. of riprap was placed per man per day.

In the preparation of the upper approach to the lock the excavation of 30 cu. yds. of rock was required. This was done by hand labor, and cost $2.05 per cu. yd. The amount of work done per man per day was 0.88 cu. yd. In the preparation of the lower apporach to the lock the excavation was done by dredge

at a cost of 9 cts. per cu. yd. for 310 cu. yds.

Guide Cribs—Permanent guard of guide cribs are placed at the head and foot of each lock wall. The upper-river crib is a solid crib, continuing the line of the river wall. This was substituted for two detached triangular cribs, proposed in the original project, in order to avoid the troublesome outward draw of the currents that would result through the open spaces. This upper-river crib is 150 ft. in length and 8 ft. in width on top; its inside face is vertical from the top to 1 ft. below the upper miter sill, below which it is stepped as is the outside face throughout, so that the width of the base 30 ft. below the top is 20 ft. The lower part of the cribwork connects with the lock wall, but above a level 2 ft. below the upper miter sill there is a gap 19 ft. wide between the crib and the lock wall for the passage of drift. The top of the crib is level with the coping. The lower-river crib, which is 120 ft. long, is similar except that no gap exists between the crib and lock wall, and that the top of the cribs is not level with the coping throughout, but drops 20 ins. after the first, the second, and the third 20 ft., so that the proportion farthest downstream is 5 ft. below the coping in elevation. The land cribs, as originally proposed, were parallel to the axis of the lock, but have been built flaring so as to give wider approaches to the lock; the upper one is 55 ft. long and the lower one 80 ft. All these cribs were built of 10x10-in. timbers, framed and drift-bolted together, pine being used below pool level and oak above. They were filled with "one-man" stone, large selected stones being set on edge with their flat faces against their side openings and the top being covered with large, well-shaped stones set level with the timbers.

The itemized costs of the various cribs are shown below.

The upper land crib contained 24,139 ft. B. M. of timber and was 55 ft. long, so that the first board measure per lineal foot of crib was 439. The preparation of the foundations for the crib required 110 cu. ft. of excavating which cost $81.96 or 71 cts. per cu. yd. The cost of the cribwork proper was as follows:

Materials:	Total.	Per M. ft. in crib.
4,372 ft. B. M. pine at $11.95 per M.	$ 52	$.215
4,834 ft. B. M. timber (no charge)	...	.....
14,933 ft. B. M. oak at $14 per M.	209	8.65
1,119 lbs. iron, spikes, etc.	30	1.24
Total	$291	$12.04
Labor:		
Handling and stacking 19,305 ft. B. M. timber at $2.56	$ 50	$ 2.07
Moving 19,300 ft. B. M. timber across river at $2.55	49	2.06
Framing and placing 24,139 ft. B. M. timber at $14.45	349	14.45
Total labor	$448	$18.58

Assuming the 4,834 ft. B. M. of old lumber for which no charge was made to cost $10 per M. ft. B. M., we have an additional cost of $2 per 1,000 ft. B. M. in the crib or a total cost of $20.58 instead of $18.58. The total cost of cribwork was therefore as follows:

Item:	Total.	Per M. ft. in crib.
Materials	$291	$12.04
Labor	496	20.58
Total	$787	$32.62

The cost of filling the crib with ripings and of filling behind the crib with earth, paving, etc., was as follows:

Riprap Filling:	Total.	Per cu. yd.
238.6 cu. yds. riprap	$167.	$0.70
Inspecting riprap (238.6 cu. yds.)	7	0.03
Filling in 238.6 cu. yds. riprap	114	0.48
Total	$288	$1.21
Quarrying and filling 65 cu. yds.	$158	$2.43
Earth backing, 42 cu. yds.	57	1.35
Quarrying and paving 26 cu. yds.	50	1.93
Total (304 cu. yds.)	$265	$0.87
Grand total (304 cu. yds.)	$553	$1.82

In framing and placing timber in the crib the average was 137 ft. B. M. per man per day. In filling with riprap the average was 3.86 cu. yds. placed per man per day.

The upper river crib contained 71,729 ft. B. M. of timber or 478 ft. M. M. per lineal ft.; its cost was as follows:

Excavation:	Total.	Per cu. yd.
Fuel	$16	$0.30
Labor exc. 52 cu. yds. boulders	82	1.570
Total	$98	$1.87

The cost of the cribwork proper comprising 71,729 ft. B. M. of timberwork was as follows:

Materials.		Per M. ft. in crib.
44,012 ft. B. M. pine at $12.34 per M.	$ 544	$ 7.58
27,717 ft. B. M. oak at $14.37 per M.	398	5.55
33,395 lbs. iron at 2.46 cts.	82	1.15
Fuel	16	0.23
Miscellaneous	9	0.11
Total	$1,049	$14.62
Labor:		
Handling and stocking 71,729 ft. B. M. at $2.65	$ 191	$ 2.66
Transp. 71,729 ft. B. M. across river at $1.47	106	1.48
Framing and placing 71,729 ft. B. M. at $9.90	710	9.88
Total	$1,007	$14.05
Grand total	$2,056	$28.64

The cost of filling the crib with riprap was as follows:

Material:	Total.	Per cu. yd.
1,475 cu. yds. riprap at 70 cts.	$1,033	$0.674
56 cu. yds. riprap picked of cofferdam	...	.....
Fuel	10	0.007
Total	$1,043	$0.681
Labor:		
Inspecting 1,475 cu. yds. riprap at 3 cts.	$ 43	$0.028
Filling 1,531 cu. yds. riprap at 39 cts.	612	0.399
Total	$ 655	$0.427
Grand total	$1,698	$1.108

In framing and placing timber 192 ft. B. M. were averaged per man per day; in filling the cribs the average per man per day was 4.7 cu. yds.

The lower land crib contained 69,872 ft. B. M. of timber; its cost was as follows:

Excavation (earth and gravel):	Total.	Per cu. yd.
Fuel	$ 27	$0.06
Labor, 445 cu. yds.	289	0.65
Total	$316	$0.71

The cost of filling the crib with 1,632 cu. yds. of riprap was as follows:

Materials:	Total.	Per M. ft. in crib.
9,000 ft. B. M. oak at $15.94 per M.	$ 144	.....
44,455 ft. B. M. pine at $13.66 per M	607	.....
16,417 ft. B. M. pine (no change)	...	.....
5,269 lbs. iron at 2.09 cts.	110	.....
Total	$ 861	.....
Labor:		
Hauling and stacking 53,455 ft. B. M. at $2.63 per M.	$ 141	.....
Framing and placing 69,872 ft. B. M. at $11.04 per M.	771	.....
Total	$ 912	.....
Grand total	$1,773	.....

The cost of backfilling and paving behind the crib was as follows:

Materials:		
1,632 cu. yds. riprap	$1,156	$0.71
Labor:		
Inspecting 1,632 cu. yds. riprap	$ 48	0.03
Filling 1,632 cu. yds. riprap	451	0.28
Total labor	$ 499	$0.31
Grand total	$1,655	$1.02

The cost of back filling and paving behind the crib was as follows:

Item:	Total.	Per cu. yd.
Fuel	$ 19	.....
70 cu. yds. backfilling	125	$1.78
62 cu. yds. quarrying and paving	101	1.68
Total	$245	.....

The total cost of the crib was $3,989.

Partial costs only are given for the lower river crib and they are therefore, omitted. Including excavation cribwork and filling but not including backing the costs per lineal foot of the three cribs was as follows:

Item.	55 ft. of U. land.	150 ft. of U. river.	80 ft. of L. land.
Excavation (150 lin. ft. crib)	$ 1.49	$ 0.653	$ 3.95
Crib construction (150 lin. ft. crib)	14.11	13.707	22.16
Filling with riprap	5.24	11.307	20.68
Total per lin. ft.	$20.84	$25.667	$26.79
Cost per M. ft. B. M.	$47.92	$53.07	$53.58

The succeeding article will give methods and costs of constructing the dam portion of the works.

LETTERS TO THE EDITOR.

Information On Stucco Work.

Sirs: I am looking for good information on stucco work, of late date. H. B.

Roanoke, Va., Jan. 15, 1910.

The latest and best information on stucco work will be found in ENGINEERING-CONTRACTING, Aug. 11, 1909, and Jan. 12, 1910, both articles having been written by men of experience.—Eds.)

A Bag of Cement Is One Cubic Foot of Cement.

Sirs: If you will permit me to take a little more of your space, I desire to say a little further in regard to an article in your paper of Dec. 22, and to a communication from me in regard to that article. I see now that I did not understand the purport of your article, and seemingly that I am entirely at variance with you in the matter.

My position in the matter is simply this: That when a contractor bids on a piece of work he wishes to know how much that work is going to cost him, and how much of each kind of material he must use in the mix. In our section of the country we buy cement, as do you, by the barrel; we buy sand by the cubic yard and stone by the cubic yard. We mix these materials generally either in one yard batches or one-half yard batches. Now, my idea of a specification for such work is that the contractor should know from the specifications how much material he must buy, and how much he must put into a batch without having to get out his paper and pencil and figure, without having to run to the city engineer or to the inspector representing the engineer to know what the engineer meant when he said "proportions are so-and-so." I get this by specifying the number of barrels or parts of a barrel of cement that the contractor shall mix with one yard of stone and a certain part of a yard of sand. He knows on the face of his specification what he has to buy, and he and the inspector can never disagree as to what must go into the mix. Now, as to whether you should say bags of cement or barrels, that cuts no figure so far as I can see. A barrel is four sacks, and it is what the contractor buys, so I prefer the use of the barrel, even though no cement is shipped in that kind of a package. I would just as soon, though, put in the sack of cement instead of the barrel, as the contractor would have no trouble in that case in figuring out what he had to do. I may be wrong, but it seems to me my point of view has some merit and is worthy of consideration.

Yours truly,
J. H. WEATHERFORD.
City Engineer.

Memphis, Tenn, Jan. 15, 1910.

(We are glad to give space to the above communication. The point of view of our correspondent certainly has merit and it is this personal equation in all matters that so often leads to apparent misunderstandings and tends to defer agreement. When we discussed the bag of cement as a unit we had in mind the average user with the average size batch concrete mixer, with capacity given in cubic feet per batch. Very few contractors own mixers in which one-yard or one-half yard batches are mixed. Mixers of those sizes are not portable to the proper degree and must of course be used on large jobs. Mixers in common use are the ¼ cu. yd. to ⅛ cu. yd. size. Proportions for concrete are generally given, as 1:2:4 or 1:3:5, etc., without a unit of measurement being fixed. Our suggestion was that the 1 stand for 1 foot and the present commercial bag or sack of cement be considered as one cubic foot. When it comes to purchasing materials there are published tables showing quantities per cubic yard of concrete and the purchasing is generally done by men more intelligent than those who do the mixing. Let the purchaser do the figuring with fractions and let the men who measure the batches get the easy work. Eds.)

Sirs: I have taken a good deal of interest in the recent discussion in Engineering-Contracting in regard to proportioning concrete materials. It has been my practice to specify the quantity of cement to be used for each cubic yard of concrete in place, the unit of measure specified being a barrel of four sacks. Suppose you specify that one sack of cement shall be used with so many cubic feet of sand and so many cubic feet of stone or gravel, the degree of looseness used in measuring the material will vary the amount of cement actually used say for a given number of yards of concrete in place. I think it is a good idea to use the sack as the unit of measure.

Yours truly,
VERNON H. SMITH.

Wooden Bridges in New Brunswick.

Sirs: Referring to a report on page 19 in Engineering-Contracting for January 5th relative to the use of wooden bridges in New Brunswick, permit me to state that no report has ever been made by the Department of Public Works in favor of the abandonment of steel bridges.

The many references in periodicals, to such a report may have arisen from the fact that in many localities throughout this province suitable bridge timber is still standing. In such localities and in other districts adjacent thereto this Department is constructing designs of covered in wooden superstructures up to 185 ft. in length between centers of end bearings, placed on concrete substructures.

In such instances they are found to be very much cheaper than steel structures in first cost, as well as in future maintenance, owing to the fact that no painting for preservation is required from time to time. A hardwood floor system is preserved for many years owing to protection from exposure; and, owing to the adopted design of covered in protection from the elements, the superstructure may generally be preserved for an indefinite period. We have existing wooden structures in this Province that in the past were constructed on some such covered in basis, where their superstructures, although now 40 and 50 years old, are yet in a good state of preservation.

With improved designs of covered in wooden superstructures placed on permanent concrete substructures, I believe a class of highway bridge is being constructed through certain sections of this Province, well adapted to the many conditions that exist. Under these conditions they will compare very favorably with highway steel truss construction work, not only in cost but in permanency.

Yours truly,
A. R. WETMORE.

Fredericton, N. B., Jan. 18, 1910.

[Mr. Wetmore is Provincial Engineer in the Public Works Department of New Brunswick and we thank him for his letter. These bridges have been illustrated in a number of wood workers' periodicals and while they may be cheap they are no ornament. No paint is used and they are completely housed in for protection from the weather. The comparison between wooden and steel structures is interesting.—Eds.]

Bidding Prices of Wooden Stave Pipe.

Sirs: I note the request made by a correspondent in your issue of Dec. 29, 1909, p. 577, for costs of wooden stave pipe. The following are some figures bid for constructing a wooden stave pipe line of 60 ins. internal diameter and 2,300 ft. long, the pressure head varying from 5 to 65 ft., and averaging about 35 ft. The bids were for completed pipe.

(1) For 60 in. pipe, 2½ in. thickness of staves of Oregon fir, and ¾-in. round two-piece steel bands, three separate bids were, respectively, $4.70, $5.75 and $5.60 per lin. ft.

(2) Same as No. 1, but with ⅝-in. bands the price bid was $4.30 per lin. ft.

(3) For 60 in. pipe, 2 1-16 in. No. 2 fir sleeves; and ⅝-in. steel bands, the price bid was $4.87 per lin. ft.

(4) For 60 in. pipe, 2½ in. redwood staves and ¾-in. steel bands the price bid was $6.37 per lin. ft.

(5) For 60 in. pipe, 2-in. staves of first class redwood, and ⅝-in. two piece steel bands the price bid was $5.12 per lin. ft.

These bids were all for furnishing the pipe materials, and constructing the pipe. The grading was let under a separate constract, and has cost $0.50 per lin. ft., exclusive of the bridges. The total cost, including backfilling over the pipe, will be about $6 per lin. ft. of pipe. The location of the pipe is near Olmstead in Provo Canyon, Utah.

Very respectfully,
CLARENCE S. JARVIS,
Engineer for Provo Reservoir Co.

Provo, Utah, Jan. 1, 1910.

Observations on the Panama Canal Work.

Sirs: I have noticed your late editorial on the high costs of day labor work on the Panama Canal. For the purpose of criticising the doings of those in, or who have been in, charge of this work, or with hopes of securing at this late date any material change in the proceedings, no discussion of the proposition is justifiable. The work will no doubt go on to a successful completion on about the present basis, and no one at all familiar with the diligent and honest efforts of those in charge should find fault with results.

However a discussion of the proposition may help settle some questions so we can know what is best to be done in carrying on public work in the future. The suggestions I offer are based on a close study of official reports and criticisms, together with information gained on two visits to the Isthmus. I stopped at the government boarding quarters and was there long enough to go many times over the entire work, making a close study of everything relating to it. My last trip was in April, 1909, and I expect soon to make a third trip.

I do not claim to be specially fitted to criticise this undertaking, although I have made a special study of, and have had a long experience in, the carrying on of construction work. Certain facts however, with the attendent conditions must come to the notice of everyone in connection with the Panama Canal work.

We will all concede that a wise selection was finally made when the men now at the head were placed there. Many believe several mistakes were made in previous appointments, but no one criticizes the wisdom of the appointments. That any difficulties, delays or disagreeable things occurred came from the unfortunate method adopted to try and select men to carry on the work. Can we believe the very best man in America has been selected? Thousands of possibly good men were not prominent enough to be considered. It is not alone at the top but farther down the line. Have the methods of selection adopted succeeded in securing the best men from the thousands of applicants? In every place there is some best man but do we get the best by offering salary and no more?

Nearly every construction job advertised brings out some man who has the means and knows the ways to gamble that he can make material reductions on hitherto known costs. The majority of these men make good and the beneficial results from their ability to make good would not have been realized had not some substantial inducement produced the good man.

Under the present system at Panama each man does his best to earn his salary, or at least hold his job. If inducements had been offered costs would have been reduced by securing experienced men who would have a free hand in developing methods on which their material well being depended.

Are the conditions under which a salaried employe must work and proceed, to safeguard the nation from graft and loss, such as will admit of him delivering desired results at minimum cost? Every one knows, without a discussion, that the only answer is "No." The increased cost is every minute and every move. There probably has not been a piece of machinery or a pound of supplies bought for the canal that would not have come cheaper to any other responsible purchaser. Many reasons exist for the same, well known to both the seller and every other person at all familiar with such doings. Then again, it likely costs Uncle Sam fully double what it would cost a contractor, to conduct his business, inspect, oversee, take care of, and pay for; also such employe is not at liberty to do his will, and work his ways. The whole system is so subdivided that each man has a very small part. If any individual devises a specially productive method the resulting gain is very small, measured against the whole; and a failure is very big judged on his little section. There must be a strong sense of loyalty on the part of the individual to the organization to lead a man to risk sacrifice. Can a man do the best that is in him without the incentive of great reward or the fear of results from failure? I do not believe a man gives his best for a salary. He must have some contingent fee.

However, the conditions exist. The organization is there and I believe we are getting all we can expect under this system. The men are loyal and absolute integrity is evidenced in every act connected with this great enterprise. A more earnest and faithful lot of men was never brought together. From the head man to the wage earner there is no useless pomp, no improper overtime, no apparent loafing. No better selection could have been made and the men are doing the best that can be done, but I believe the Government is losing millions because of undertaking the work by salaried employes instead of awarding it by contract.

I cannot compare present costs with what a contractor might do as that is merely a matter of opinion and I do not see my way clear to convincing conclusions. If the method of doing things or the organization back of the method is wrong then costs, results and progress cannot be good. The present good organization has only lately been made a perfect machine and the work is half done before this highly desirable result has been achieved. Engineers formerly received their whole education at the employer's expense. Now the technical part is paid for by themselves and they pick up the practical part while working in subordinate positions. In the present instance, however, the Government has had to pay high for educating its employes. The organization is now good, but why was it not as good from the start? The new methods of cost keeping and reports enables comparisons to be made of the work of each gang so that new spirit is being infused. Contractors would not have been five years getting daily reports and cost records into shape.

The equipment in general is good and sufficient yet will be out of date before the work is completed. Before affairs were in shape a start was made and old worn out, broken and in many cases obsolete French machines were used. At the present time with the new machines we see only what we are accustomed to. No new ideas seem to be developed as they would be in the case of contract work. The job was about one-third done before modern cars and engines were supplied to the shovels. A contractor would have gone broke trying to use the old patched French cars and engines. At the present time the service is excellent, but not so very long ago I could stand in Culebra Cut and see from 10 to 15 steam shovels idle waiting for cars, not for an hour or two only, but half to three-fourths of them as a regular proposition.

A long, long time ago it was known that large quantities of broken stone must come from Porto Bello hill and a crusher plant was ordered and installed long before it was required. Some one blundered and a No. 6 crusher was installed. It was hardly more than a coffee mill and its insufficiency was seen from the day it commenced work. Strenuous work was done and yards of red tape unreeled with the result that it was in use nearly a year before a larger crusher was ordered, and it will be a long time before it is in operation. Why did not the Commission advertise for bids to furnish this stone by contract? If a contractor made a mistake in the size of a crusher he would telegraph to the maker and it would be there on the next steamer. In the first place he would not be likely to make the mistake, and in the second place he would not have to work through bureaus, each checking the other. These checks are to prevent waste and stealing. Have we proof that they prevent waste, and is there proof that they are needed to prevent stealing? From the class of men one sees on the work it is certain better results

could be secured if their hands were more free.

Porto Bello hill was not stripped in advance of working the rock. The output of rock was not started when needed and expected, although the plant was started hastily when half completed. This is directly chargeable to lack of experience of the men in charge. It would have been easy to find contractors who would have backed their bid by a bond and who might have worked the quarry in a vastly different way. Why not have received bids and not permitted the day labor work unless the men in charge could show the lowest bid was too high? There are many opportunities to do better work on the Panama Canal, but no chances for the best men to be brought out and allowed to do it.

Lately some attention has been paid to letting a few small contracts with excellent results and considerable saving. This is really no measure of what can be done for there are practically no contractors there and the jobs are too small to be attractive to men in the States. If some large general contractor, or an association of contractors, had the work and followed the usual practice of subletting the Isthmus would be full of small contractors and there would be a big saving on past costs. I have seen many instances of extremely high costs not reported for lack of proper field supervision. In many cases jobs handled by inefficient foremen are large enough to be very attractive to the average sub-contractor in the United States. I have seen it cost over $2 per cu. yd. to move soft dirt 150 ft. and $3 to get rid of dirt within 300 feet simply because the foreman met each thing as it came. The jobs were small compared with the canal, but would look big to some contractor, and how many jobs are there like these on the canal?

In short, in the Canal Zone I found cases of individual waste that one can find in all large enterprises public or private. They are bigger on the canal because the proposition is so big. Work is judged by reports instead of field supervision. Men are paid salaries instead of being given a chance to participate in profits. I think many of your criticisms are partly justified, but they are a trifle severe.

C. L. BARTLETT.

Cedar Rapids, Ia., Dec. 29, 1909.

Comment on the Results of Tests of Certain Water Proofing Compounds Obtained at the Engineering Experiment Station of the University of Wisconsin.

Sirs: In an article published in the Jan. 5 issue of Engineering-Contracting concerning tests of commercial waterproofing compounds for concrete, some very strange results were obtained, which are not in accordance with the tests made by the most eminent engineers and chemists along the same line. This article is so manifestly unfair to Aquabar that we feel called to comment upon it. We regret that one of your editors did not take up this matter with our engineering department prior to the publication of the article.

On Feb. 13, 1907, Mr. Richard K. Mead of Nazareth, Pa., a noted cement chemist and member of the Committee for Standardizing Cement Tests, reported that discs of 1:3 standard sand ½ in. thick allowed no water to percolate through when subjected to a head of 50 ft., and that small vessels of the same mixture, cylindrical in shape and 8 ins. deep, with walls and bottom ¼ in. thick, which were hand moulded on the inside of porcelain or glass cups, were watertight.

These vessels were loaded with lead slugs so that they were immersed in water, and at the end of six weeks they were still dry. It was also found that 1:3 briquetts gaged with Aquabar showed 298 and 400 lbs. in 7 and 28 days, respectively, which Mr. Mead reports "is strong enough for the most exacting concrete work."

His conclusions are that Aquabar is an efficient waterproofing agent, not only for concrete building blocks, cement bricks and cement roofs, but also for cisterns, stand-pipes, deep reservoirs, conduits, etc., when concrete work must be waterproofed under pressure of water.

Dr. Chas. F. McKenna, 50 Church street, New York, N. Y., reports that discs 10 ins. in diameter and 1 in. thick showed the following results:

Mixture	Failed at lbs.	Mixture	Failed at lbs.
Cement 1		Cement 1	
Ottawa Sand 3	50	Ottawa sand 1	40
Water	20	Water	50
Cement 1		Cement 1	
Ottawa sand 3	50	Ottawa sand 1	70
Aquabar 1 to	50	Aquabar 1 to	80
Water 24 parts		Water 24 parts	

In this case you will notice that 1:1 discs without Aquabar broke at an average of 45 lbs. per sq. in., while 1:1 discs with Aquabar broke at an average of 75 lbs. per sq. in. In neither case did the water penetrate entirely through the discs, nor did the Aquabar show a decrease in strength.

The significance of a mortar composed of 1:3 sand, and standard sand at that, resisting these water pressures is not to be lightly estimated, as standard sand being of a uniform size has a greater percentage of voids than any sand used in actual work.

However, single and isolated instances in laboratory tests are apt to be misleading in conclusions. There is much wisdom in the old saying that "The proof of the pudding is in the eating," and the staunchest supporters of Aquabar are those who have used it.

The value of a test wherein 1:3:5 concrete is submitted to a water pressure equal to 46 to 92-ft. heads is problematical, and is a condition almost never met in actual practice, and would require a slag which could resist a pressure of 1½ to 3 tons per sq. ft. Concrete can be used, however, and made waterproof by integral waterproofing against all pressures encountered in engineering practices, but no engineer would attempt it against high pressures with 1:3:5 concrete, as same is not dense enough to make intimate connection with the reinforcing steel necessary, as reinforced concrete would have to be used under such conditions.

We have an instance in Atlantic City, N. J., wherein the basement slab of a boardwalk rest pavilian is 15 ft. below high tide. A strong east wind will bring the water up to and sometimes past this place. The concrete was mixed and put in place by ordinary labor, and it is absolutely watertight. There is at no time less than 5 ft. of water pressure at the slab.

Experiments on a laboratory scale will show that plain cement mortar is practically waterproof against high pressure if the surfacing is carefully done and the mortar applied in two or more layers each denser than the preceding one, with the surface of the last troweled smooth and fine. I have yet to see this miracle accomplished on a job of any size. It will not work. I have traveled considerably; I have seen the men who have relations and friends who did it; I have seen the man who said he did it—but I have never seen such a job.

On the other hand, I have seen cases of a very difficult nature handled by contractors with poor equipment and poor labor, and with every condition against them, finish absolutely waterproof by using Aquabar, while in no other way could they have accomplished the result without a great deal of expense.

The case I have in mind is that of a garage basement built 5 ft. below the water level. The condition of the work was such that it was necessary to build the walls little by little, a piece here and a piece there instead of a continuous piece of work as nearly monolithic as possible. The work was interrupted by some heavy storms, the walls were built a small piece at a time and hand mixed, ordinary proportions being used without reinforcing.

The elevator pit was 12 by 24 ft., and there was a considerable pressure which brought with it a quicksand composed of clay, sand and silt. It was necessary, owing to the inadequate equipment on hand, to lay this slab a little bit each day. Bleeder pipes were inserted to relieve the water pressure so that the mortar finish could be bonded to this slab. The same had to be done to apply the finish to the balance of the floor, which was about 8 ins. thick and reinforced with wire mesh; one of these bleeder pipes was sealed in cement mortar and a stop-cock put in the top. The basement is entirely dry, but the garage was drawing a considerable part of its water supply by opening the stop-cock and taking the water supply from the pressure beneath.

The manufacturers of Aquabar are willing to give a surety bond guaranteeing the contractor's concrete impervious to water, provided he will have the work done under supervision from the factory, which is merely to see that the Aquabar is used in the proper proportion and the materials used so as to obtain the maximum density.

In the last few years we have waterproofed the structural mass as well as the cement mortar wearing surface of a great many suspended reinforced concrete floors, in which, if the strength of the concrete were affected as reported, there would be some failures and collapses but such is not the case. On the contrary, there are quite a number of floors waterproofed with Aquabar which are carrying considerable overloads, which wear excellently and are still waterproofed, with every prospect of continuing waterproof indefinitely.

There has been no call as yet upon the surety bonds furnished by the manufacturers guaranteeing any waterproofing on a piece of work. There have been a considerable number of these bonds furnished covering all conditions of work, and there has been ample time for percolation to occur.

In conclusion, I would like to say that experience has shown much in favor of integral waterproofing in general and Aquabar in particular. The advantages of such a system are quite obvious. This system is growing faster than any other. Day by day new converts are made to its use. It has already stood the test of all sorts and conditions met in waterproofing and passed them successfully. That it will ultimately be the only system of waterproofing there is no doubt. There only remains the education of the public to the use of integral waterproofing. This is readily accomplished, for it appeals to every one as both the simplest and the best possible method to use, making the structural mass itself form a continuous line of impervious concrete.

J. F. NACHOD.

Philadelphia, Pa., Jan. 19, 1910. Vice-Pres. Girvan-Nachod Co.

(We are glad to give space to this communication. The suggestion that our editors should have consulted with the manufacturers of Aquabar or of any of the other water proofing compounds tested before publishing the original article seems poorly founded. The article was an abstract from an officially published report of tests made by an investigating laboratory having no purpose to subserve except the discovery of the truth in so far as that might be possible. That these tests are absolutely conclusive no one will claim, least of all, we believe, the laboratory authorities under whose direction they were made. It must be plain that no alteration of the results as given was permissible to the editors either with or without consultation with interested parties. The editors' sole right was to present the results exactly as given as being of interest to their readers. We give space to the above communication for the same reason.—Editors.)

The company has recently placed on the market town sites in Prince Rupert, and has realized excellent prices for the same. It is interesting to note that 80 new town sites have been opened along the main line of the prairie section, between Winnipeg and Edmonton. The work is being hurried with all possible despatch.

The school board of Chicago recently invited a well known firm of contractors of that city to bid on some contracts for new school buildings. The contractors replying to the invitation wrote: "We regret to say that we cannot figure on the general contract when you are taking bids from masons and carpenters who can figure more cheaply on account of having their offices in their hats."

Technical Society Meetings.

The list following names those technical societies in which engineers and contractors are most interested, whose meetings are to be held within three months of the date of this issue. There are given for each society listed the date and place of meeting and the name and address of the secretary, to whom all communications and inquiries should be addressed.

American Railway Engineering and Maintenance of Way Association.
March 15-17, 1910. Annual convention at Chicago, Ill. Secy., E. H. Fritch, 962 Monadnock Block, Chicago, Ill.

American Society of Engineering Contractors.
Feb. 24-26, 1910. Annual convention at Chicago, Ill. Secy., Daniel J. Hauer, Park Row Building, New York, N. Y.

Connecticut Society of Civil Engineers.
Feb. 8, 1910. Annual meeting at New Haven, Conn. Secy., J. Frederick Jackson, Box 1304, New Haven, Conn.

Illinois Association of Municipal Contractors.
Feb. 24-26. Annual meeting at Chicago, Ill. Secy., Orie T. Dunlap, Edwardsville, Ill.

Illinois Lumber Dealers' Association.
Feb. 16-18. Annual meeting at Chicago, Ill. Secy., Geo. K. Hotchkiss, 315 Dearborn St., Chicago.

Illinois Masons' Supply Association.
Feb. 16-18. Annual meeting at Chicago, Ill. Secy., Geo. K. Hotchkiss, 315 Dearborn St., Chicago.

Illinois Society of Engineers and Surveyors.
Jan. 26-28, 1910. Annual meeting at Cairo, Ill. Secy., E. E. R. Tratman, 1636 Monadnock Block, Chicago, Ill.

Interstate Mantle and Tile Dealers' Association.
Feb. 15-19. Annual meeting at Chicago, Ill. Pres., Joseph W. Lantry, Wm. H. Jackson Co., Union Square, New York City.

Iowa Association of Cement Users.
March 9-11, 1910. Annual meeting in Cedar Rapids, Ia. Secy., Ira A. Williams, Iowa State College, Ames, Iowa.

Iowa Engineering Society.
Feb. 16-17, 1910. Annual convention at Cedar Rapids, Ia. Secy., A. H. Ford, Iowa City, Ia.

National Association of Cement Users.
Feb. 21-25, 1910. Annual meeting at Chicago, Ill. Secy., Geo. C. Wright. Address all communications to Edw. E. Krause, Asst. to the President, Harrison Bldg., Philadelphia, Pa.

National Brick Manufacturers' Association.
Feb. 7-12, 1910. Annual convention at Pittsburg, Pa. Secy., T. A. Randall, Indianapolis, Ind.

Ohio Engineering Society.
Feb. 8-10. Annual meeting at Columbus, Ohio. Secy., C. J. Knisley, New Philadelphia, O.

Northwestern Cement Products Association.
Feb. 18-21, 1910. Annual meeting at Chicago, Ill. Chairman of Executive Committee, O. U. Miracle, Minneapolis, Minn.

Western Drainage Contractors' Association.
Feb. 17, 1910. Fort, Dodge, Ia. Secy., S. F. Moeller, Knierim, Ia.

Personals.

Mr. Benjamin Chatfield, for a number of years in the City Engineer's Department of Waterbury, Conn., has been appointed Superintendent of Streets and Sewers of that city.

Mr. F. C. Finkle, Consulting Engineer, has removed his office from rooms 230-231 I. W. Hellman Bldg., to 628½ South Spring St., Los Angeles, Cal.

Mr. R. W. Valls, who for some time has been assistant chief engineer of the Case Crane Co., of Columbus, O., has been appointed chief engineer of the company, to succeed C. H. Tucker, who resigned to go to the Toledo-Massillon Bridge Co.

Robert W. Gay, formerly with Viele, Blackwell & Buck, of New York City, has entered upon his new duties as assistant superintendent of construction for Hunt & Hunt, Architects, of New York. Mr. Gay will be located at Port Washington, Long Island, N. Y.

Mr. M. J. Butler has resigned his position as Deputy Commissioner of Railways and Canals of the Canadian Government with offices at Ottawa, Ont., to become General Manager and Second Vice President of the Dominion Iron & Steel Co. and the Dominion Coal Co.

The U. S. Civil Service Commission, Washington, D. C., will hold an examination on March 9-10, 1910, at various cities throughout the country, to secure eligibles from which to make certification to fill two vacancies in the position of topographic draftsman (male) in the Coast and Geodetic Survey, one at $1,000 and the other at $900 per annum, and vacancies requiring similar qualifications as they may occur in any branch of the service. The salary of the position of topographic draftsman ranges usually from $1,000 to $1,500 per annum, and for copyist topographic draftsman from $900 to $1,500 per annum.

Clifford Buxton, Chief Engineer of the Toledo & Ohio Central Ry., with headquarters in Toledo, died Jan. 12 in that city. He was graduated from Rensselaer Polytechnic Institute in 1865. In 1879 he became connected with the Ohio Central Ry., which later became the Toledo & Ohio Central Ry.

Mr. H. K. Barrows, Associate Professor of Hydraulic Engineering at the Massachusetts Institute of Technology, and Mr. C. B. Breed, Assistant Professor of Civil Engineering at that institution, have entered into a partnership under the firm name of Barrows & Breed and will engage in a general civil engineering practice.

Major George P. Howell, Corps of Engineers, U. S. Army, now on duty in Washington, has been assigned to take charge of the river and harbor and fortification works in the Galveston district, effective Feb. 10, to relieve Captain John C. Oakes, Corps of Engineers, assigned to take charge of the river and harbor works in the Second Cincinnati district.

Leroy M. Harvey, Sales Manager of the Milwaukee District office of Allis-Chalmers Co., died Jan. 19. Mr. Harvey had been in poor health for the past five months and a short time ago went to Augusta, Georgia, with the hope that the change in climate would benefit him. He died at the New Partridge Hotel in that city from diabetes and brights disease. Mr. Harvey was born in Oak Park, Ill., about 37 years ago and was graduated from the University of Michigan, in 1898, from the course in Electrical Engineering. After graduation Mr. Harvey entered the employ of the Westinghouse Electric Co. and was with that company for about a year. From there he took up experimental work for the Siemens & Halske Co., in Chicago. Later he was in the Chicago sales office of the Northren Electric Mfg. Co. Six years ago he accepted a position in the sales department of Allis-Chalmers Co. and about three years ago was made manager of the Milwaukee District office, which position he held until his death.

Mr. I. W. McConnell, until recently Supervising Engineer U. S. Reclamation Service, has become Chief Irrigation Engineer of the J. G. White & Co., Inc., of New York City, and will have general supervision of all matters relating to the irrigation undertakings of the company. His headquarters will be at the main offices of the company, 43 Exchange Pl., New York City. Mr. McConnell was born in 1871 and was graduated from Cornell University in 1897. In 1897 and 1898 he was employed on the United States deep waterways surveys and in the United States navy yard, Brooklyn. During a part of 1898 he was engaged as contractor for the North Tarrytown sewerage system, and in the fall of that year returned to Cornell University as instructor in Civil Engineering, remaining there until 1900 when he became superintendent of construction for the Indianapolis water works. In 1901 Mr. McConnell entered the employ of Nash & Dowdle, general contractors, Chicago and New Orleans, as superintendent on the construction of the Chicago Clearing Yard which involved a large amount of railroad work and on the New Orleans drainage works. From January to June, 1903, he was professor of Civil Engineering at the Missouri School of Mines, going from there into the United States Reclamation Service as project engineer on the Uncompahgre, Colorado project, the principal items of which were the Gunnison Tunnel Canal construction, unification of old canals and water rights and general administration of the entire project, involving the expenditure of over $6,000,000.00, and on which work he was engaged from 1903 to 1907. During the past two years he has been supervising engineer of the Central District, United States Reclamation Service, having general supervision of all government irrigation work in South Dakota, Southern Wyoming, Nebraska, Colorado, Kansas, Oklahoma, and Northeast New Mexico, the principal projects being the Pathfinder Reservoir, Interstate Canal on North Platte River, Belle Fourche Project, South Dakota, involving a large earth dam and canals, Garden City Project, Kansas, a steam electric plant for recovery of underflow, Uncompahgre Project, Colorado, tunnels and canals, and the Grand Valley Project, comprising large canal works, the annual expenditure of the district was about $1,500,000.00, and the ultimate cost of the work under construction will involve an outlay of over $25,000,000.00.

The active work of locating the line of the Hudson Bay Railway commenced October 18 at the Pas Mission. Other parties will be sent out later. The preliminary survey of the road, which was completed this year, has given the engineering staff weeks of labor to figure on grades and the facilities of various routes. Lakes and other difficulties in the formation of the country will furnish engineering problems, but it is the intention to push the location line as fast as possible. The party will work out all winter, receiving supplies by dog trains.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Sewers, Tanks and Walls.—Paper 3½x6 ins. 16 pp. Northwestern Expanded Metal Co., Old Colony Building, Chicago, Ill.

For the past two years this company has been issuing booklets on reinforced concrete prepared by an engineer of experience. The last booklet contains a discussion on the reinforcement of sewers, tanks and retaining walls with expanded metal, giving tables containing full data on size of fabric to use and proper amounts in each case.

Weber Chimneys.—Paper, 6x9 ins. 24 pp. Weber Duller Co., Pacific Electric Bldg., Los Angeles, Cal.

This catalogue describes the reinforced concrete chimney patented by Mr. Carl Weber, C. E., and gives a partial list of firms (500) for whom Weber chimneys have been built in many states and countries.

Sewage Disposal in Detached Houses.—Paper, 4x6 ins., 8 pp. Ashley House-Sewage Disposal Co., 6515 Normal Blvd., Chicago, Ill.

The Ashley Septic Tank System is fully described in this pamphlet. It is written by Walter H. Harrison, C. E., of Philadelphia.

Gasoline Storage.—Paper, 3x6 ins., 8 pp. Janney, Steinmetz & Co., Philadelphia, Pa.

Gasoline storage outfits of 55 gals. and 110 gals. capacity for automobiles, are here described with prices. Tanks are seamless welded steel.

Conveyors and Elevator Buckets.—Paper 3x6 ins. The Jeffrey Mfg. Co., Columbus, Ohio.

This firm sends Booklet 33 of 24 pp. ill., describing wire cable conveyors and Booklet 34 of 24 pp. ill. describing elevator buckets. The date of publication of each booklet is Dec. 1909, so contains the latest information.

Connelly Street Flushing Machines.—Paper, 6x9 ins., 12 pp. The Barron & Cole Company, Franklin St. and West Broadway, New York, N. Y.

On paved streets it is becoming general these days to do the cleaning with flushing machines instead of brooms. The Connelly flusher is described in this catalogue.

Measuring Tapes and Rules.—Paper, 3½x5 ins. 96 pp. The Lupkin Rule Co., Saginaw, Mich.

Each man who uses a tape or rule is surprised when he learns that a 96 page catalogue is necessary to adequately illustrate the output of one manufacturer. This catalogue therefore not only gives descriptions and prices of measuring tools but has an educational value in showing men something about other lines of business.

Mallett Locomotives.—Paper, 8x11 ins., 12 pp. American Locomotive Co., New York, N. Y.

The detailed information here given on the Mallett Articulated Compound Locomotive should be of value to bridge designers and railroad engineers.

Sidewalk Science.—Paper, 6x9 ins., 12 pp. Hotchkiss Lock Metal Farm Co., Binghamton, N. Y.

This booklet describes the Hotchkiss metal sidewalk farms consisting of channels connected by interlocking cross pieces used to make expansion joints.

Oil Pull Tractor.—Paper, 7x10¾ ins. M. Rumely Company, La Porte, Indiana.

A few weeks ago Engineering-Contracting described some traction engines and locomotives in which oil was used instead of steam as a motive power. This catalogue describes another of the same class. It is well written and has a colored frontispiece of "The Spaders," by Millett.

Centrifugal Pumps, Gasoline and Steam Engines.—6x9 ins., 36 pp. Erie Pump & Engine Co., Erie, Pa.

This catalogue describes centrifugal pumps, single and multi-stage, direct connected to steam engines, oil engines and electric motors. Tables of sizes and capacities also given.

Cement Production in 1909.—It is estimated that the total production of cement in the United States in 1909 was 63,500,000 bbls., an increase of nearly 10,000,000 bbls. over 1908. The high price for the year was $1.53 per barrel, the low price was $1.33 per barrel and the average price was $1.39 per barrel.

Contract News Section

of

ENGINEERING-CONTRACTING

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

Two large municipal contracts are now being advertised. One of these, bids for which will be received by the City Commissioners of Dallas, Tex., on Feb. 16, calls for the construction of the dam, spillway, pumping station foundations, etc., on the White Rock reservoir site in that city. The total estimated cost of this water supply development is $730,840. Another large contract is the one now being advertised by the City of Tacoma, Wash. This contracts calls for constructing the headworks and tunnel for a hydro-electric power plant on the Misqually River. The work includes a concrete diverting dam and a concrete lined tunnel, 10,015 ft. long. Bids will be opened Feb. 21, by H. J. McGregor, Commissioner Public Works, Tacoma, Wash.—The State Superintendent of Public Works, Albany, N. Y., is calling for bids until Feb. 16, for a large contract in connection with the construction of the State Barge Canal. This is contract No. 49 and calls for constructing 6.18 miles of the Erie Canal from a point 500 ft. east of Yellow Mills bridge to the Wayne-Monroe County line. Bids will also be received at the same time for constructing guard gate, superstructures under contract No. 75, Erie Canal.—Announcement has been made that the U. S. Senate committee on irrigation will report a bill providing for a $30,000,000 bond issue to complete irrigation projects.—Among the larger railroad contracts of the week are the following: Lorimer & Gallagher, Chicago, Ill., for filling in bridges on the line of the Chicago, Milwaukee & Puget Sound Ry., in Washington west of the Columbia River; The Flick Construction Co., Chicago, Ill., was awarded the contract for filling in the bridges east of the Columbia river. The J. A. Ware Construction Co., St. Louis, Mo., secured the contract for raising the grade of the Santa Fe between Pauls Valley and Dougherty. Okla.—The National Railways of Mexico has opened bids for grading, tunnel and masonry work on the proposed line from Durango to Llano Grande, State of Durango, Mexico, and probably has by the time this is written awarded contracts for the work. The line will be approximately 100 kilometers long.—The Connecting R. R. Co. which is to build a $25,000,000 line in New York City to connect the terminals of the Pennsylvania and N. Y., N. H. & H. R. R.'s, has secured practically all right of way and is only awaiting approval of its plans for the Hell Gate bridge before beginning work.—As was expected, the stockholders of the Missouri Pacific R. R. have voted to increase the bonded indebtedness of the company by $175,000,000. Eleven subsidiary lines are to be taken over by the company.—The Alberta & Great Waterways Ry. is going ahead with preparations for beginning work on its line from Edmont on to Fort McMurray in Canada, and is reported to have placed orders for the steel rails and other supplies.

A Long Projected Project.

It is now announced that construction work on the Cape Cod Canal will be completed in 1912. The matter of constructing this canal across the eight mile neck of land between Barnstable, Mass., and Buzzards Bay holds all records for long time discussion. Generation after generation of promoters have promoted the project and gone their way, and now after over 230 years of talk it seems that the canal is to become a reality. In 1670, just 50 years after the pilgrim fathers landed at Plymouth on the rock celebrated in history as the trade mark of the pants that never rip and the breed of fowls that never scratch, the first charter for the canal was granted by the colonial authorities of Massachusetts. Nothing came of this grant, although the holders of the charter made vigorous attempts to secure funds in England. For many years afterward the matter was under discussion, but it was not until 1776 that anything definite was done. In that year the general court of Massachusetts appointed a committee to investigate the feasibility of the project. The committee reported in favor of constructing a 14-ft. deep canal and estimated the cost at $175,000. Money went farther in those days, as George Washington's feat of throwing a silver dollar across the Potomac River shows, and the general court of Massachusetts found it impossible to raise the $175,000 to carry out the work. Another reason for the abandonment of the project at this time was the presence of a hostile British fleet. During the period of the revolutionary war nothing was done regarding the canal and it does not seem to have come to general attention again until 1791, when surveys were made. These were repeated in 1818 and in 1824 the U. S. government took hold of the matter and had surveys made. At this time the president of the United States recommended that the canal be constructed. In 1860 the matter came up again, but the civil war made it impossible to raise funds for the work. In 1880 work was actually started, but was stopped in 1885 after about 1 mile of canal had been excavated and about $1,000,000 expended. Since that time there has hardly been a session of the general court of Massachusetts when some company did not ask a charter to construct the canal. In 1899 a charter was granted to the Boston, Cape Cod & New York Canal Co., which company undertook the work. On May 8, 1907, the joint board of railroad and land commissioners of Massachusetts approved the final location of the route, and one month later the first shovelful of earth was thrown.

Making Things Simple.

It is always good policy in writing for a paper, or in making reports, to use language the average reader will understand. Sometimes an engineer may use technical language, but it is well to follow it with terms the ordinary man will appreciate.

A very good illustration of this has been called to our attention in a report by a British engineer on tests made on reinforced concrete slabs. First he speaks of the load being "1054 lbs. per sq. ft. = 9 cwt. 1 qr. st. 4 lb." The stress in steel he gives as, "74,527 lbs. per sq. in. = 33 tons, 5 cwt., 1 qr., 1 st. 5 lbs."

An engineer would understand fully what he meant by "lbs. per sq. ft." or "lbs. per sq. in.," but the report was to be read by others than engineers so he proceeded to make it plain for other readers, a thoughtfulness worthy of commendation. American engineers have always been unnecessarily rude in talking and writing about lbs. per sq. in. or ft. without worrying about their auditors who find it necessary to forget about yards, perches, stones, quarters, bushels, etc. Some American engineers even advocate using the metric system so things will be still more simple and the laymen will have more to forget.

Such of our readers who may wish to check the report of the British engineer will be assisted by remembering the ton he uses weighs 2240 lbs., a cwt. is 112 lbs., a qr. is 28 lbs. and a st. 14 lbs.

Sporting Notes.

Some time ago it was announced in the daily press that the well known knight of the padded mit, Packie McFarland of Chicago, was to give up pugilism and engage in the more lucrative (sometimes) business of sewer contracting. This report was evidently premature, for, like Alexander, Mr. McFarland has gone to England to spread his conquests further. And now comes a report from New York stating that baseball fans in that city are much alarmed over a report that the New York Nationals may lose Christy Mathewson. It is said that the pitcher has refused to sign with New York because of objections to the new major league contract, which binds a player to his club all the year. Mathewson, it is said, has saved up considerable money and is only awaiting a favorable opportunity to enter a contracting business in Maine.

The Georgia Railway & Electric Co., Atlanta, Ga., is planning to build several miles of double track.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

CALIFORNIA.

The City Council of Los Angeles has granted a franchise to Fred W. Forrester for a street railway line on Vermont avenue from Muth street to 8th street. The franchise has been assigned to the Los Angeles Ry. Co., which will construct the line as an extension to its present system.

The San Jose Railroads Co. recently incorporated with a capital stock of $5,000,000 to take over the 1st street line at San Jose, has had surveys partly made for the construction of several additional lines in San Jose. The projected length of the line is 15 miles. L. E. Hanchett, Merchants' Exchange Bldg., San Francisco, Cal., is President and W. R. Lamson, San Jose, Cal., is Chief Engineer.

IDAHO.

The Twin Falls-Salmon River Land & Water Co. has not as yet, owing to the severe weather, completed surveys for the projected railway line from the Salmon River Dam to Jarbridge. It is the intention to follow the most feasible route to Jarbridge and yet top the West End Twin Falls Irrigation project, either by electric or a steam road, also to put in a power line from the Snake River power plants. Alex. McPherson, of the Twin Falls-Salmon River Land & Water Co., Twin Falls, Idaho, is interested.

INDIANA.

The Columbus, Greensburg & Richmond Traction Co. has completed one survey for its projected 80-mile line and proposes to let construction contracts within 90 days. The road is to extend from Columbus through Greensburg and Connersville to Richmond. M. A. Peoples, Kingman, Ind., is chief engineer and August M. Kuhn, Indianapolis, Ind., is president. C. Frank McCallie, Columbus, Ind., is also interested.

Surveys have been made, capital has been secured and grading has been started on the 55 mile line of the Fort Wayne & Toledo Electric Ry. Co. The route is from Fort Wayne to Harlan, Ind., Hicksville, Farmer and Bryan, O., with a spur to Montpelier, O. The contract for constructing the road has been let to the Keystone Construction Co. W. H. Cost is Chief Engineer, E. A. Tennis is President and R. T. Bastress, Harlan, Ind., is General manager.

KANSAS.

The Kansas Northwestern Railway Co. desires correspondence with strong construction company with financial connections enabling them to place large portion of the bond issue. Particulars can be obtained from O. W. Dawson, secretary, Great Bend, Kas.

Surveys have been made and located and the grading work has been over half completed for the projected 68 mile electric line of the Kansas City, Lawrence & Topeka Ry. Co. The route is by way of Edwardsville and Lawrence to Topeka. W. E. Winner, 426 Rialto Bldg., St. Louis, Mo., is President, and J. G. Hughes, 424 Rialto Bldg., St. Louis, is Chief Engineer.

KENTUCKY.

The Louisville, Lincoln Farm & Mammoth Cave Traction Co., has completed surveys in part for the construction of its projected 60-mile line on the L. & N. Turnpike from Glasgow, Ky., via Lincoln Farm to Hodgenville, Ky. The capital for construction has been secured but construction contracts will not be let before Feb. 21. Chas. Van den Burgh, Glasgow, Ky., is President.

MAINE.

Surveys have been made and capital has been secured in part for the construction of the projected 13¾ mile electric line of the Skowhegan & Athens Electric R. R. Co. The road is to extend from Skowhegan to Athens and will connect with the Maine Central R. R. It will be used principally for carrying freight. The company which is to control the line has not effected its permanent organization as yet but expects to do so shortly. It is expected that contracts for constructing the line will be let in the early spring. John Jones, Lewiston, Me., is Engineer, and Charles R. Oliver, Athens, Me., is the promoter.

MONTANA.

Surveys have not been completed as yet for the projected 30-mile extension of the Gallatin Valley Electric Ry. Co., and it will possibly be 60 days before construction contracts are let. N. C. Van Natta, Bozeman, Mont., is Chief Engineer.

OREGON.

The Board of Portage Railway Commission will receive bids until Feb. 1, at the office of Newell, Gossett & Walsh, 32 Washington building, Portland, Ore., for the grading, bridging and tracklaying necessary in the construction of the extension of the Portage Railway from Big Eddy to The Dalles, a distance of 4.05 miles. Specifications and profiles showing approximate quantities can be obtained from the engineers at the above address.

TEXAS.

The St. Louis, Paris & Gulf R. R. has completed surveys for its projected 78 mile line from Paris, Tex., to Winnsboro and Quitman to Mineola, and wishes to get in touch with a general contractor or construction company that can complete the first ten or twelve miles. M. J. Healy, Mineola, Tex., is interested. Mr. Healy will also be glad to hear from parties on the T., N. M. & P. Ry. deal, which calls for the construction of 75 miles of line from McTuney, Tex., to Bridgeport, Tex.

As stated in our last issue the Grigsby Construction Co., Dallas, Tex., has been awarded the contract for constructing the 30 mile line of the Henrietta Southwestern Ry., from Scotland City, Tex., to Archer City, Tex. The contract includes 80,000 cu. yds. of excavation and embankment. The sub-contractors now finishing their work on the Gulf, Texas & Western Ry., will be used on this work. M. B. Mobberly, Henrietta, Tex., is Chief Engineer of the Henrietta Southwestern Ry.

WASHINGTON.

Lorimer & Gallagher, 217 La Salle St., Chicago, Ill., have been awarded the contract for filling in the bridges on the line of the Chicago, Milwaukee & Puget Sound Ry. west of the Columbia River. The Flick Construction Co., Old Colony Bldg., Chicago, Ill., secured the contract for filling in the bridges east of the Columbia River. The latter contract calls for the moving of some 2,000,000 cu. yds. of dirt.

WISCONSIN.

The Milwaukee Western Electric Ry. Co. is now arranging to secure the capital for the construction of its projected 74 mile line from Milwaukee to Beaver Dam and Fox Lake by way of North Lake, Hustesford and Juneau. Surveys for the line have been made and the contract for its construction was let last year to W. D. Chapman, Sr., Chicago, Ill. The Wisconsin Railroad Commission has recently granted the company a certificate of necessity and convenience for the construction of the line. C. A. Chapman, Marquette Bldg., Chicago, Ill., is Chief Engineer; Val Zimmerman, Jr., Milwaukee, Wis., is President and J. W. Barber, Milwaukee, Wis., is Secretary.

Power Developments, Levees, Drainage and Irrigation Works.

ARKANSAS.

Bids are asked by the board of directors, Woodson Levee District, at office of Lund & Hill, engineers, 201½ W. 2d St., Little Rock, Ark., until 10 a. m., Feb. 9, for the following work: Nine miles of levee, containing 165,700 cu. yds.; 8 culverts, 8 gates and a reinforced concrete floodgate. The estimated cost of the work is $45,000.

CALIFORNIA.

Plans and specifications for the excavation of the ditch of The Tarr Mining Co. have been issued, and bids will be received by The Tarr Mining Co., Smartsville, Yuba Co., Cal., until Feb. 5. The Tarr Mining Co. also has offices at Room 12, Stoll Bldg., Sacramento.

COLORADO.

J. H. Nations, Contracting Co., Box 81, Montclair, Colo., has been awarded the contract for constructing the earth dam and outlet canal for Reservoir No. 1 of the Holbrook Irrigation District. The contract for the earth dam, outlet gates and tunnel for the Dye Reservoir of the same district was not let and the work will be readvertised in the near future. Bids for both pieces of work were opened Jan. 10. J. E. Lewis, LaJunta, Colo., is Secretary of the District.

Bids are asked by the Costella Estates Development Co., 56 Bank Bldg., Colorado Springs, Colo., until noon, Feb. 21, for the construction as a whole or separately of the following work, located in Costella County, Colorado: The Sanchez Dam, containing about 500,000 cu. yds. of earth work; the Sanchez Dike, containing about 250,000 cu. yds. of earth work, and the Culebra-Sanchez Canal, containing about 250,000 cu. yds. earth work, together with necessary controlling works and about 15,000 cu. yds. rock excavation. O. V. P. Stout, Lincoln, Neb., is the engineer. Official advertisement will be found elsewhere in this issue.

LOUISIANA

Bids are asked by the Board of Commissioners of Red River and Bayou des Glaizes Levee & Drainage District, A. E. Gremillon, Secretary, until Feb. 1, for the construction of the Davids Ferry South No. 2 levee on the right bank of Red River in Avoyelles Parish. The levee is to be about four miles in length and will contain about 350,000 cu. yds. of material.

MISSISSIPPI.

Contracts for 230,000 cu. yds. of levee work in the Mississippi Levee District have been let as follows: Stations 600 to 715, 90,000 cu. yds., to Dulaney, Foote & Shields, Greenville, Miss., at 16.9 cts. per cubic yard; Stations 715 to 862, 140,000 cu. yds., to George Miller, Longwood, Miss., at 25 cts. per cubic yard. Bids for the above contracts were opened Jan. 10, by the Board of Mississippi Levee Commissioners, C. H. West, Chief Engineer.

WASHINGTON.

Preliminary surveys have been made for the proposed canals of the Inland Waterway & Canal Co., of South Bend, Wash., and much of the right of way has been secured. Final surveys are to be started in the near future. As proposed the canals are to connect Grays Harbor with Willapa Bay and are to extend from the

latter place through to the Columbia River. The first canal, the one leading from Grays Harbor into Willapa Bay, at a point near North Cove, will have a length of about eight miles, where it enters Willapa channel. However, in order to secure a more protected route this intersection may be extended from North Cove through the Georgetown and Tokeland sloughs, making the real entrance into Willapa Bay at Toke's point near Tokeland, about four miles farther than the North Cove entrance, which would make a total length of this first canal about 12 miles, about half of which distance would be very light excavation—widening, deepening and straightening sloughs, etc. The second canal begins at the southern head of Willapa Bay, occupying about two miles of the mouth of Portage Slough thence running a general direction of S. 45° E. about 1¼ miles, entering the Wallicott river about one mile above its entrance into Baker's Bay, at a point about one mile E. of Ilwaco. These two canals would open an inside water route from Portland, Ore., to Montesano, Washington—a distance of about 200 miles. The original design was to cut these canals merely for the passage of launches and scows—a width of 24 ft. and a depth of 6 ft. of water and on these dimensions the engineer based his estimate of the amount of excavation as being within 500,000 cu. yds and at a cost of about $60,000, plus the cost of locks at either end of each canal. But since the formation of the Inland Waterway & Canal Co. it is proposed to cut the canals 30 ft. wide with a depth of 12 ft., which of course will materially add to the original estimate. Also the additional four miles from North Cove to Toke's point was not included in original estimates. Altogether and on both canals there is about 15 miles of excavation and as it is now arranged will total about twice the original estimates. The idea of cutting these canals was conceived first by Mr. J. N. Hudson, Tokeland, Wash., and he is the Chief Engineer of the company.

WISCONSIN.

P. J. Hurtgen, City Engineer of Burlington, Wis., has completed the preliminary survey, and commissioners have been appointed for the Hoosier Creek drainage district, which includes lands in Racine and Kenosha counties. The area to be drained includes about 13,000 acres and will reclaim about 3,000 acres of land that is now practically useless for cultivation. The length of the main ditch will be about 12 miles, and there will be constructed about 40 miles of laterals. Bids may be called on this work early next summer.

TEXAS

Bids are being asked by the City Commissioners of Dallas, Tex., until 3 p. m., Feb. 16, for constructing the foundation for the pumping station, building the dam, spillway and other appurtenances at the White Rock reservoir site. The dam to be erected is to have a clay-filled trench from end to end. Before the filling with clay sheet piling of pine is to be driven in the bottom of the trench to hard pan, or white rock. The earthen dam is to be 2,100 ft. long and about 42 ft. high at its greatest height. It is to be 211 ft. wide at the base and 16 ft. wide at the top. From the top to a line about half way to the bottom of the upstream side there is to be a concrete apron from end to end of the dam. The spillway of concrete at the western end of the dam will be 450 ft. wide. The spillway will have over it a reinforced concrete walkway and the upstream end of the piers of this walk will be furnished with cast iron guides for flash boards. These flashboards are to be removed in times of floods and will at other times raise the water level in the reservoir two feet above the crown of the spillway. The drainage area of the basin the dam will form is estimated at 114 square miles. The reservoir will flood 1,429 acres. The holding capacity of the dammed-up reservoir is estimated at 5,785,000,000 gallons. The estimated cost of all of the improvement, including the purchase of the land, the 15,000,000-gallon pump, the three boilers and the six miles of mains 18 and 36 in. in size, respectively, is $730,840. The plans for the work were prepared by J. M. Preston, City Engineer of Dallas.

The Minneapolis, St. Paul & Sault Ste. Marie Ry. has two surveying parties in the field laying out a line from Thief River Falls northeast to the Rainy River in the vicinity of Beaudette and thence along the south shore of the river to International Falls.

The Elkhorn Southern R. R. Co. recently incorporated has filed maps to reach coal lands in Dickenson County, Va. This road is reported to be backed by the Carolina, Clinchfield & Ohio Ry., which will build the extension under the above name. M. J. Caples, Johnson City, Tenn., is Chief Engineer, C. C. & O. Ry.

Bids are being asked by the New River Collieries Co., L. E. Yoder, Chief Engineer, Eccles, W. Va., for building one mile of railroad and yards at Eccles.

The Alabama & Vicksburg R. R. is preparing to build double tracks through the city of Jackson, Miss., and this is taken to mean that the line is to be double-tracked at no far distant day from one end to the other—from Vicksburg to Meridian. The rights of way are said to have been secured through the city. C. Dougherty, Cincinnati, O., is Engineer Maintenance of Way of the Queen & Crescent Route which controls the Alabama & Vicksburg R. R.

The Atchison, Topeka & Santa Fe Ry., C. A. Morse, chief engineer, Topeka, Kan., is stated to have awarded a contract for double tracking its line from Ash Fork, N. M., to Winslow, Ariz., a distance of 90 miles. It is said that the next section to be double tracked will extend from Albuquerque, N. M., to Gallup, a distance of 150 miles.

The New York, New Haven & Hartford R. R. has purchased five acres of land in Stratford, Conn., on which to locate a power station. This leads to the conclusion that the railroad will continue the electrification of its line from Stamford, Conn., to New Haven, Conn.

Construction work on the standard gage line projected from Twin Falls, Ida., to connect with the Southern Pacific near Cobre, the northern terminus of the Nevada Northern road, will soon be completed. The line is now completed from Twin Falls to Rogerson, a few miles north of the Nevada-Idaho state line, and within 30 miles of Contact. The entire road is expected to be in operation by the end of August, 1910.

The Tampa & Gulf Coast R. R., which projects a line from Tampa, Fla., to Tarpon Springs, Fla. is now laying steel at Keystone Park Colony. The Tampa & Gulf Coast R. R. leaves the main line of the Tampa Northern railway at Lutz station, and passing through Odessa enters the Keystone Park Colony tract at the northern edge.

The Madisonville, Hartford & Eastern R. R. was formally opened for traffic at Madisonville, Ky., on Jan. 6. The road has been in course of construction for the past three years.

Good progress is being made by the U. S. government engineers in the surveys for the projected 30-mile sea-level canal from Taunton, Mass., to Bridgewater and thence to the south shore at either Plymouth, Hingham or Scituate. While the engineers refused to estimate the cost of the projected water way, unofficial figures place it at about $30,000,000, or five times that of the Cape Cod canal, now being built from Buzzard's Bay to Cape Cod by private capital. The canal, if completed, would enable vessels to lessen materially the time required for passage from Narragansett Bay to Boston. The geological character of the land is said to be favorable. The canal is planned to be 25 ft. deep at mean low water and 250 ft. wide at the bottom.

The Norfolk & Western Ry. is to build about 4,500 ft. of track near Keystone, W. Va., which will extend company siding at Keystone to Eckman. It is expected that work will be commenced on the additonal track at once.

A bill is before congress to authorize the Baltimore & Washington Transit Co. of Maryland to extend its street railway line in a number of streets in the District of Columbia.

Francis E. Warren, Cheyenne, Wyo., is planning to build ten reservoirs in northern Weld county and southern Wyoming for converting his sheep ranch into farm land.

The Beaver Dam R. R. Co. of Damascus, Va., has been incorporated with a capital stock of $1,000 to $5,000 and proposes to build a railroad 1.6 miles long in Washington County, Va. The officers are: J. E. Rooney, president, Buffalo, N. Y.; H. M. Cox, vice president, Damascus, Va.; J. U. Weisz, secretary, Damascus, Va.

The Greenville, Spartanburg & Anderson Ry. Co. of Greenville, S. C., recently incorporated to build an electric line from Anderson to Spartanburg, has started surveys for the proposed line and contracts for the construction work will be let soon. J. B. Duke, Somerville, N. J., and Ellison A. Smyth of Greenville, S. C., are among the incorporators. This line was mentioned in our last issue.

J. H. Barrett, electrical and construction engineer, Pittsburg, Pa., is at Albuquerque, N. M., to get data preparatory to making plans and estimates for the proposed electric line in the Highlands.

According to a statement reported to have been made by Minor C. Keith, United Fruit Co., 17 Battery place, New York, N. Y., construction will be started shortly on the Guatemala Northern R. R. from Zacapa, Guatemala, to Santana, Salvador.

The Aberdeen (S. D.) Railway Co. has applied to the city council for a franchise for electric lighting. The company will start construction on its proposed street car lines, involving the laying of 4 miles of track, in the spring.

Active work on the rehabilitation of the Boston & Maine R. R. has begun, under direction of the New York, New Haven & Hartford interests. The board of directors at a recent meeting authorized an expenditure of $2,000,000 for the improvement and betterment of the road, which will include straightening the line and double tracking 15 miles between Salem and Gloucester, Mass. J. P. Snow, Boston, Mass., is chief engineer, Boston & Maine R. R.

The Southern Pacific Ry. Co. has under consideration the construction of new shops at Tucson, Ariz., at the "Circus Grounds," where the Twin Buttes extension will cut into the main line. Nothing definite has as yet been decided. W. H. Whalen, Tucson, Ariz., is division superintendent.

The Chicago, Milwaukee & Puget Sound Ry. is preparing to begin work as soon as the weather permits on laying steel on the two branch lines of the railroad out of Mobridge, S. D., through the reservation country. Grading on the Moreau line is all done with the exception of cutting a new channel for the Grand river in one place, and that portion of the grade from the bridge to the junction of the Moreau and Cheyenne lines is all ready for the iron. W. H. Molchoir, Marmath, N. D., is superintendent

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Arkansas, Oklahoma & Western R. R., which was built from Rogers to Siloam Springs, a distance of 35 miles, by W. R. Felker, of Rogers, Ark., has been sold to Eastern capitalists. J. D. Locke of St. Louis has been elected president and general manager of the road. The Missouri Pacific Ry. is said to be back of the deal and it is believed that the road will be extended east to Bald Knob to connect with the Missouri Pacific road at that point. The short line road from Monte Ne to Lowell, a town five miles south of Rogers, which was recently bought by Senator F. F. Freeman from W. H. Harvey, is also said to be a Missouri Pacific trade. The extension of this road east from Rogers will mean much for that town, as it will open up a fine timber territory, which heretofore has not been touched on account of being inaccessible to a railroad.

The Fort Smith Light & Traction Co., J. Walter Gillette, General Manager, Fort Smith, is planning to extend its park line to the Arkansas River opposite Van Buren.

Citizens of Arkadelphia have raised a bonus of $60,000 to secure the entrance of the Memphis, Paris & Gulf R. R., to that city. At present the road is in operation from Texarkana to Murfreesboro and surveys are being made for the Texas extension, which will run to Dallas. The route east from Arkadelphia will probably be by Pine Bluff and Marianna to Memphis. It is possible that the line may take over the old lumber road of the Arkadelphia Lumber Co. which runs through Dallas County for a distance of about 30 miles. This road is of standard gage and has been put in good condition during the past few months, which fact is taken by some to mean that it will become a part of the new line. H. C. McCluer, Nashville, Ark., is Chief Engineer.

At a recent election held in Munroe, La., it was voted to extend the time granted the Arkansas, Louisiana & Gulf R. R., for the completion of that line north from Hamburg to Pine Bluff, Ark., and also for the line projected south of Monroe, La. J. M. Parker, Hamburg, Ark., is General Manager of the company.

The Manilla & Southwestern Ry., at present in operation between Herman on the Frisco and Lunsford, is to be extended five miles to Lake City. F. W. Taylor, Lunsford, Ark., is President.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Councilman E. B. Bullock, of Alameda, is advocating the erection of a municipal wharf on the property owned by the city at the foot of Grand St. in that city. His plans call for a dock, either of concrete or teredo-proof piling, extending to deep water, lined with warehouses and equipped for discharging and unloading cargo.

The construction of a dam across Putah Creek just below Coyotte Valley for the purpose of forming a reservoir to irrigate land in Yolo and Solano counties is proposed by a company of which A. N. Fairchilds, Los Angeles, is President. Surveys for the reservoir site were made some time ago.

The stockholders of the San Jose Railroad, the corporation which recently merged the street railways in San Jose, have decided to issue bonds to the amount of $1,500,000, and the action was ratified by the stockholders. The 1st St. line in San Jose will be entirely reconstructed.

Negotiations are reported under way for letting grading contracts for the construction of the Fresno-Hanford Interurban Ry., Fresno National Bank Bldg., Fresno. It is reported that George W. Elder, San Francisco, has been awarded some of the work.

The Sierra Irrigation Co. has been incorporated with a capital stock of $3,000,000. The incorporators are H. C. Swain, O. C. Combs, Alva Dennis, W. L. Bransford and J. J. Wells, all of Red Bluff. The purposes of the corporation, besides irrigation, are the generation and sale of electricity and gas. The principal place of business is San Francisco, but the company's operations will be carried on from offices in Red Bluff. This corporation is the reorganization of the Valley Irrigation Co., whose incorporation was recorded a short time ago.

The Southern Pacific Co. has applied to the County Supervisors at Oakland for a franchise for a small connecting line in Albany and Berkeley, to form part of the extension into that part of Berkeley known as Northbrae.

The Atchison, Topeka & Santa Fe Coast Lines Co. is reported to have secured right of way for the construction of a 6-mile line from Angiola to Alpaugh in the southern part of Tulare County. Surveys are under way and the proposed line, owing to encroachments of Tulare Lake upon the right of way, will be constructed on an embankment. H. C. Phillips, Los Angeles, Cal., is Chief Engineer of the company.

According to reports, Leo C. Lennon, 625 Market St., San Francisco, Cal., and H. E. Gilmore, have petitioned the supervisors for a franchise to construct a standard gage railroad from Fresno to Coalinga, Cal.

The Southern Pacific Ry. Co., has started surveys for the construction of a railroad from Arbuckle, Cal., to Calusa, Princeton, Glenn, Jacinto, St. John and Hamilton City, Cal., connecting at the latter place with the present Wyoming branch, near Orland. William Hood, San Francisco, Cal., is Chief Engineer of the company. The Northern Electric Ry. Co., as stated in our last issue, also has under consideration the construction of a similar line.

Board of Public Works of Los Angeles, Cal., has ordered the Los Angeles-Pacific Ry. Co. to tear up its tracks at Occidental Blvd., where it crosses Sunset Blvd., and relay them according to the plans first submitted by the company to the city engineer.

The Pacific Light & Power Co., of Los Angeles, has taken out new articles of incorporation, the capital stock now being $40,000,000. This increase of capital stock will be used in part for improvements, and work will begin at once on the Redondo plant, and $1,500,000 will be spent in adding three more units to those already installed. At the present time the Redondo plant is composed of three units of 7,500 h. p. More water power will be developed, not only at Kern River, where the company's power is now generated, but new water will be harnessed and extensive improvements will be made in the operating end.

The State Engineering Department, N. Ellery, chief engineer, Sacramento, has started the revetment work on the San Joaquin River near Banta at what is known as the Lorenzen whirlpool. The work of preventing the river from eating into the bank will cost nearly $10,000.

Stock subscriptions are being raised in Sonoma and Lake counties for the projected Highland Pacific R. R. The road is to be a standard gage electric line starting from Santa Rosa, its route being as follows: Out past Mark West school house, through the Coffey tract, past Chisholm's winery, thence through the heart of Alexander Valley to the town of Preston; from there, keeping to the east side of the Russian River, the road will climb a grade of not to exceed 2½ per cent and tunnel through the divide, separating Sonoma and Lake counties. This tunnel, 2,900 ft. in length, will cost $200,000, and after leaving it Highland Springs will be reached, with a spur three miles in length extending to the town of Kelseyville, thence to Lakeport and Upper Lake. Dr. A. E. Dickinson, Ukiah, Cal., is president. J. E. Fulton, Lakeport, is also interested.

The city wharf at Sacramento is to be extended for a distance of 100 ft. The estimated cost is $5,000. M. R. Beard is mayor of Sacramento.

The California Corporation, of Sacramento, has taken over a majority of the stock of the Stockton & Mokelumne Canal Co. The main canal and laterals are more than 100 miles long, comprising one of the largest irrigation systems in California.

The Atchison, Topeka & Santa Fe Ry., H. C. Phillips, chief engineer, Los Angeles, has secured all of the right of way for its cutoff from Richfield to Fullerton, via Placentia, and it is said that construction work will be started at an early date.

The Southern Pacific Ry. is to build a subway under its tracks at New Castle. The work will be done under the direction of A. J. Barclay, assistant engineer, Auburn, Cal.

Dr. G. W. Dwinnell, of Montague, has purchased 1,500 acres of timber land about five miles from Macdoel, including a mill site and water rights. It is stated that he will begin immediate operations and will employ 50 men from the start. A railroad will be built from the millsite to Macdoel, five miles, and a large saw mill and box factory will be built.

Engineers of the Southern Pacific Co. have been over the route of the projected extension of the electric line from Oakland to San Jose. Announcement has been made that the old steam road lines of rails will not be used for the extension of the electric system, but that an entirely new track will be constructed. This work of electric extension is to be undertaken as soon as the electrification of the suburban and interurban system of the Southern Pacific about the east bay shore cities is completed.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chicago, Burlington & Quincy Ry. has purchased land at a cost of $160,000 in the vicinity of 20th St., Denver, to be used presumably to facilitate connections between that line and the Colorado & Southern. It is believed that additional switches and sidetracks will be built to handle the increased traffic.

Engineers of the Denver & Rio Grande R. R. are stated to have driven stakes for a permanent survey up the Chama River from Chamita, following the old survey, which is partly graded. The line is to be standard gage and the stakes are now in as far as Abiqui, whence the line will go to Elvado, there connecting with the line from Lumberton. J. G. Gwyn, Denver, Colo., is chief engineer.

The Denver & Rio Grande R. R. has secured the material for standard gaging its line between Montrose and Salida.

The Maybell Valley Reservoir & Development Co., of Denver, has been incorporated with a capital stock of $150,000 by Kurt Grunwald, John J. Munzer and George N. Robinson.

The Denver & Rio Grande Ry., according to reports current here at Denver, has decided to soon build a double track from Denver to Pueblo through Colorado Springs, making such other changes in the track as may be found necessary. At present the road has double tracks out of Pueblo, Denver and Colorado Springs, but these only total about 40 miles of the distance between the three cities.

The Denver & Clear Creek District Ry. has increased its capital stock from $80,000 to $500,000 and the Hall Construction Co., Los Angeles, Cal., which is building the new road

from Pactolus, a point 25 miles west of Denver on the Moffat road, to Black Hawk, is preparing to proceed at once to complete it. The line will be 17 miles to Black Hawk, with a branch eight miles long.

The Colorado Southern Irrigation Co. has offered the DeWeese-Dye Ditch & Reservoir Co. of Canon City the sum of $10,000 for the privilege of erecting a dam across Grape Creek canon a mile below the DeWeese-Dye reservoir in the Wet Mountain Valley. Directors of the latter company will take the matter under advisement until Feb. 5, at which time they will submit a report for the acceptance or rejection of the stockholders.

Advices from Greeley state that the Farmers' Reservoir & Irrigation Co. will build a canal in the district south of Greeley to be 17½ miles long, cost $56,000, and irrigate 25,000 acres. It will be a part of the Standley lake system and secure seepage from Beebe draw, the East and West Hudson laterals, the Speer and Neres canal.

The proposed irrigation system to be constructed for the Henrylyn and Golden-Littleton irrigation districts by the Camfield Development Co., of Denver, as mentioned in our Jan. 12 issue, will be one of the largest constructed in Colorado. The work will include a tunnel 14,725 ft. long, and the further transportation of this water 110 miles to reservoirs for distribution. The principal source of the water supply will be the Williams fork of the Grand river and its tributaries. Some 700 second-feet of water will be conveyed from this stream, on the western slope of the continental divide by means of the tunnel, to Clear Creek, on the eastern slope. This water will be taken out of Clear Creek, near Denver, and diverted to the Platte river by a short ditch. It will be taken out of the Platte near Sand Creek, and conveyed by ditch to the reservoirs near Hudson.

The Colorado Railway, Light & Power Co. of Denver has filed a $5,000,000 mortgage. This money will enable the company to make the promised improvements of service in Trinidad and vicinity, and machinery will immediately be ordered which will increase the capacity of the Trinidad plant from 1,400 to 15,000 hp. The current will be extended to Walsenburg and surrounding coal camps, and the service in Trinidad improved greatly.

The Highland Power Co., recently incorporated with a capital stock of $3,000,000, proposes to begin work in the spring on a reservoir on the west branch on Middle Boulder Creek above Eldora. The plant will supply electricity for mining, agricultural and domestic purposes. The company will take over the holdings of the Highland Mary Mining & Milling Co. J. H. Bair, the president, is a Philadelphia broker. The incorporators are H. O. Andrew, Boulder attorney, and I. N. Bair and H. W. Brougher, both of whom were formerly officers of the Highland Mary Co. The directors are: H. O. Andrew, H. W. Brougher, J. H. Bair, E. A. Austin, J. E. Slothower and J. Frank Turner.

F. D. Patterson, a mine owner of Rowena, Colo., has been appointed resident manager of the Boston-Colorado Power Co., a concern that is to develop the electric power of Jim and Leftband creeks in the mountains west of Boulder.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

It is reported here in Chicago that both the Chicago, Burlington & Quincy Ry. and the Illinois Central R. R. are considering purchasing the Illinois Southern Ry., owned by John R. Walsh. The Burlington and the Central both have shops and terminals at Centralia, Ill., which is but a short distance from the northern terminus of the Illinois Southern. Both roads desire the line for southwest development, for which it would be admirably adapted.

The Rock Island Southern Ry. has secured all right of way for its Aledo stub line with the exception of one property and has begun condemnation proceedings to secure this.

City Engineer Stevens of Joliet has been instructed by the city council to make a careful examination of the bed of Hickory creek and report to the council such changes and improvements as he believed would insure the community against the danger of flood.

Grading work for the Kankakee & Urbana Traction Co.'s line will probably be started early this spring. Contracts for the grading work are said to have already been let. W. J. Brock, Kankakee, is president.

Advices from Alton state that owners of 1,250 acres of land on Missouri Point have about made arrangements for building a levee that will protect their land from flood. The levee will be raised and a levee district will be created.

Advices from Golconda state that the Toledo, St. Louis & New Orleans R. R. Co. has been letting contracts for clearing a right of way through the counties of Gallatin, Hardin and Pope, with a view of having all the right of way ready for grading by April 1, so as to facilitate the construction of that part of the road from Golconda to the south approach of the terminal in Gallatin County, and put that part of the line from this point to the spar mines in operation as soon as possible. N. M. Burns of St. Louis is interested.

The Decatur-Southern Traction Co., which proposes to build an interurban line from Decatur to Pana, has been incorporated with a capital stock of $25,000, the incorporators being William S. Carter, George H. Winson and Henry R. Davis.

Petitions are being circulated at Moline asking for the doubletracking of the Moline, East Moline & Watertown interurban from 23d St. to the east city limits of Moline.

President R. R. McCormick of the Sanitary District of Chicago, has requested of the Secretary of War an additional flow of 1,000,000 cu. ft. of water per minute when the Calumet branch of the sanitary canal shall be opened. If the consent of the department is secured it is announced that immediate plans will be made for beginning the Calumet canal.

It is expected now that the Washington St. tunnel at Chicago will be completed by July 1, five months ahead of the contract time. Work on the main section of the tunnel was begun Nov. 1, and at present there are employed 300 men, working in three eight-hour shifts of 100 men each. The tunnel will be 1,800 ft. in length, and the total contract, which includes the west approach, which was let first, amounts to $750,000. The work is being done by the George W. Jackson Co. of Chicago.

Officials of the Baltimore & Ohio Ry. Co. are collecting data in view of constructing a branch line from O'Fallon to Belleville, Ill., a distance of 9 miles.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Petitions are to be filed in the Gibson County Circuit Court at Princeton asking for the construction of a levee along the Wabash to be built along the eastern bank of the river, beginning at New Harmony, Posey County, and extending through Gibson County to the mouth of Patoka. A levee will also be built along both banks of the Patoka through Gibson and Pike counties. The total length of the two levees will be about 80 miles and will cost about $4,000 per mile.

Farmers below Vincennes are considering building a levee from the end of the present levee to Little Rock, thence east to Decker, thence up to Purcell, about 25 miles. William H. Brevort, Vincennes, Ind., is interested.

The capitalization of the Pittsburg & Lake Erie R. R. is to be increased by a stock issue of $6,000,000. The stock will be issued in $50 shares to stockholders at par.

The construction of a dam in Pigeon Creek at a point above Evansville Packing Co.'s plant for the purpose of abating the stench nuisance in the summer months has been suggested by Edward Stickleman, member of the Board of Public Works of Evansville.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The directors of the Iowa & Omaha Short Line R. R., now under construction, have decided to extend the line from Treynor to the vicinity of Oakland. The survey of the company's line now runs between Carson and Oakland, but will probably be changed so as to bring it into Oakland or to the immediate vicinity of that town. Plans are now being made by President George Adams, Council Bluffs, to have the line between Treynor and Oakland cross sectioned as soon as the weather will permit field work, and it is expected contracts will be let in time to build the extension in connection with the completion of the Council Bluffs-Treynor division of the road this spring.

The Iowa & Illinois Electric Ry. has asked the city council of Davenport, Ia., for a franchise to lay a track along the river front. P. P. Crafts, Clinton, Ia., is general manager.

Bids were opened Jan. 18 by the supervisors of Woodbury and Monona Counties at Sioux City for constructing the West Fork ditch, Forrestall & Feyen, St. Paul, Minn., being the low bidders at about $80,000.

It is reported that the Illinois Central R. R. has completed surveys for 180 miles of the proposed line from Sioux City, Ia., to some point in Idaho and that work will begin on the new project in the Spring. A. S. Baldwin, Chicago, Ill., is Chief Engineer of the company.

According to reports from the vicinity of Charles City, Ill., the Chicago, Rock Island & Pacific Ry. Co. is considering the construction of a line from Rockford, Ill., to Charles City and to Mason City, Ia. W. H. Peterson, Chicago, Ill., is Assistant Chief Engineer of the C. R. I. & P.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Illinois Traction System, H. E. Chubbuck, General Manager, Peoria, Ill., is planning extensive improvements to its traction system in Wichita, Kan. These improvements include a number of extensions and the erection of a new power house.

The Missouri Pacific R. R. Co. is reported to have ordered a large amount of 85-lb. rail for the improvement of the Central Branch and Omaha Division in Kansas and Nebraska. The work will include the replacing of many old bridges with new steel structures. C. A. Chandler, Atchison, Kan., is Assistant Division Engineer.

Towns along the Lincoln Branch of the Union Pacific have been petitioning the company to improve its roadbed between Salina and Oakley, Kan. R. L. Huntley, Omaha, Neb., is Chief Engineer of the Union Pacific.

The Hutchison Interurban Ry. Co., Hutchison, Kan., has decided to extend the line on North Main St. to the fair grounds and construct an extension to the soda ash plant in the Spring. Emerson Cary is President of the company and W. A. Scothorn is General Manager.

Preliminary surveys have been completed from Beloit, Kan., to Kearney, Neb., for the projected line of the Dakota, Kansas & Gulf R. R. Baxter L. Brown, St. Louis, Mo., is Chief Engineer.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Steps are being taken to secure the necessary legal permission to build one or more water power dams on the River Raisin in the vicinity of Dundee and Petersburg. Ex-Senator Charles A. Ward, formerly of Ann Arbor, is one of those back of the proposition. A hearing has been asked from the state railroad commission for permission to issue bonds to develop power on the Raisin.

Capitalists residing at Yale and Avoca have secured options on property in Kimball, Clyde and Grant townships, along the shores of Black River between Wadhams and the upper end of Grant township, and it is said that a power dam will be constructed at Wadhams. The dam will probably be built below the place where Milk creek runs into Black river.

The Chippewa River Power Co. has renewed its application for a franchise in Bay City. The company proposes the construction of a dam on the Chippewa River to develop 7,500 hp., the development involving the ex-

penditure of about $760,000. Wilbur F. David son, Port Huron, Mich., is interested. Charles O. Lenz, 71 Broadway, New York City, is the Engineer.

Plans have been submitted to the Board of Public Works of Grand Rapids, Mich., by L. W. Anderson, city engineer, for diverting Coldbrook creek north of the Grand Trunk R.R. The plan contemplates the construction of a culvert about 15 ft. wide and 10 ft. high on the interior from the east line of Emerald avenue west and north to within Highland Park north of the south driveway. The remainder of the creek to be an open channel to the north line of Highland Park. The approximate estimate of the cost is as follows:

Excavation, backfilling, etc.	$25,615
1,530 in ft. culvert (3,140 cu. yds. at $10)	34,100
4 wing walls (75 cu. yds. at $10)	750
Lowering concrete bridge in Highland Park	200
2 manholes at N. East St. and pipe under culvert	200
2 manholes at Grand Ave. and pipe under culvert	200
Total	$61,065

Work is now under way on the first dam to be constructed on the Au Sable River by the Eastern Michigan Power Co. This dam is known as the Cooke dam and is located about 16 miles from Oscoda. About 60 men and 10 teams are at present employed on the work. Work has been started on cribs for turning the river and an excavator has been set up. The work is in charge of J. F. Eaton of Flint, superintendent, and Grant Cochran of Jackson, superintendent of construction. Mr. Cochran has held a similar position in the building of four other dams. George Johnson of Reves Station, F. B. Taylor of Jackson, Frank Howe and Jos. Sachs are carpenter foremen on the job.

Frank Wixson, Saginaw, is reported to be promoting a project for the construction of a series of seven dams developing thousands of horsepower, on the Tittabawassee River between Edenville, in Midland County, and a point in Gladwin County, during the coming summer. It is planned to use the power developed for concerns in these two counties and a few in Saginaw and Bay counties.

The Grand Rapids Electric Co. has filed a map with the State Railway Commission at Lansing, Mich., of the proposed route of the projected electric line from Mt. Pleasant to Gladwin, via Clare.

Business men of Coldwater, Mich., have pledged $10,000 for purpose of preliminary work on the proposed electric line between Battle Creek and Coldwater. Milo D. Campbell, Battle Creek, Mich., is interested.

Thomas Handy, Handy Bros., Bay City, Mich., has prepared all details for the construction of a steam railroad from Bay City to Caro, a distance of 42 miles and is arranging with the State Railway Commission for a hearing on the plan for the organization of a company to take up the project. The estimated cost of the road is $500,000.

The Dundee Hydraulic Power Co. has been authorized to issue bonds amounting to $10,000 to be used in the construction of a water power station at Dundee, Mich. As the development proceeds the company will be allowed to increase the issue to $20,000.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Grading for the Missouri Pacific railway cross-over south of the stock yards at St. Joseph was practically finished early in January. This is the first step in bringing about the road's new terminal arrangement in St. Joseph, whereby all its trains will be detoured west of the stock yards along the river front as they enter St. Joseph. The Missouri Pacific track south of St. Joseph is east of the Burlington right of way, and the present grading is to provide a place for building a new Missouri Pacific track west of the Burlington, with a crossing to it.

Missouri River farmers in the McBaine bottoms near Columbia are organizing a levee district. The McBaine bottoms comprise 1,400 acres that have been overflowed by the Missouri River almost annually. It is estimated that $10,000 will be needed to construct the six miles of levee.

J. H. Van Brunt, general manager, St. Joseph Street Ry. Co., has applied to the county court at St. Joseph for a franchise to extend the North St. Joseph car line to the Andrew County border. The proposed improvement would be part of the St. Joseph-Savannah interurban line.

Grade stakes for the line of the Hannibal & Kirksville R. R. have been set between Palmyra and Bethel, and the work of getting out the blue prints is now under way at the office of the Roberts-Abbott Co., the engineer, in Cleveland, O.

Stockholders of the Missouri Pacific R. R. Co. have voted to increase the bonded indebtedness of the company $175,000,000. It is planned to use the money to purchase $25,000,000 of Iron Mountain bonds and to take over eleven subsidiary lines, as follows: Carthage & Western; Joplin & Western; St. Louis, Oak Hill & Carondelet; Sedalia, Warsaw & Southwestern; Nebraska Southern; Omaha Belt Line; Omaha Southern; Pacific Ry.; Pueblo & State Line; Kansas & Arkansas Valley and to lease the Boonville, St. Louis & Southern. George J. Gould, 195 Broadway, New York, N. Y., is President of the Missouri Pacific Ry.

St. Louis Items.

BY A. E. KOENIG.

L. J. Smith, L. A. Nutter, R. C. Stripp and Z. C. Mitchell of the L. J. Smith Construction Co. spent three or four days in town getting lined up and ready to begin work on their ballasting contracts for 1910.

Judge Herman Hackman of the St. Louis County Court informs us that the year 1910 will be a banner year in road building in St. Louis County. Judge Hackman said the county court will probably spend in the neighborhood of $200,000 improving and building new roads this year. St. Louis County now has some of the best thoroughfares in the state, and is widely known for its excellent roads. Judge Hackman said: "Outside of the regular annual road fund of about $100,000, the county court has an extra $100,000 at its disposal, derived from the special road tax levy of 20 cents on the $100 valuation. The latter sum is to be used entirely in building new roads; that is, making rock roads out of dirt roads, macadamizing them." According to figures in the office of County Collector Fred L. Kerth, the special road tax is distributed as follows: On real estate, $79,064.82; personal property, $11,698.22; and railroads, $13,296.85. On the real estate assessment $52,225.20 and on the personal property $7,632.31 has been collected to date, while the railroads have paid their taxes in full, making a total collected thus far of $73,154.36, or more than 73 per cent of the total amount, with two months' time to collect the balance. Judge Hackman said: "The showing made this year by the collector's office was very pleasing and gives assurance of improved conditions among our residents. The county court has already under advisement road improvements which will cost nearly $80,000 to be made during the present year. About twenty-two miles of new road have already been determined on, contracts having been let for a portion of the roads." Following is a list of the roads to be improved. Where the price is stated the contract has been let and where no price is given no bids have as yet been called for: Bonhomme Township—Woods Mill road, 1 mile, $810; Mason road, 1,500 feet, $360; Ross avenue, ½ mile, $400; Kehr's road, 8,875 feet. Total, 3½ miles. Carondelet Township—Reaves Barracks road, 1 mile, $965.50; Mattese School road, 1½ miles, $1,000; Becker road, ½ mile, $350; Ringer road, ½ mile, $350; Page avenue, 7,133 feet, $2,000. Central Township—Ballas road, 8,800 feet, $1,310; Jackson road, 5,222 feet; Denny road, 9,575 feet, $1,252; Walton road, 2,800 feet, $565.50; Link road, 2,485 feet, $500; Woodson road, ⅜ mile, $416.50; Pendleton avenue, 400 feet; Elmwood avenue. Total, 6⅛ miles. Meramec Township—Olive street road, ½ mile, grading at $4.58; Hanna road, ¾ mile, petitioners to furnish gravel; Eatherton road, 2,000 feet, $460; Old State road, 19,547 feet. Total, 5¼ miles. St. Ferdinand Township—Trampe road, ½ mile; Old Hall's Ferry road, grading, 3,500 feet; Parker road, grading, ½ mile; McLaren avenue, 1,500 feet, at 20 cents for macadam and $7 for grading; Parker road, Florissant to Hall's Ferry road, 1½ miles, $1,260; Fee Fee road, cemetery to Midland railway, 1¼ miles, $1,110; Redman avenue, 4,200 feet, grading, Links road, 1 mile, grading; Chambers road, ½ mile, $705. Total, 7 miles. Judge Hackman said in improving new roads not all the expense is borne by the county, but the petitioners in most cases are required to furnish a portion of the money needed. County Roads and Bridge Commissioner Wm. Elbring stated the cost of road building has increased about 35 per cent within the last few years. He said: "Although all work in the county is given out by contract to the lowest bidder, the cost of feed and the scarcity of farm labor so close to the city have increased to such an extent that the contractors naturally have to charge more for their work, grading especially costing a great deal more than it did eight years ago." The greatest number of miles of new road built in a single year in the county was in 1904, the extra money coming from the extra road tax levy of 15 cents, which was declared unconstitutional by the legislature. The amount spent for new roads in that year was $127,512.08, of which $18,351.55 went for masonry and $109,160.53 for road work.

McCann Bros. came in from Murphysboro, Ill., looking for four or five second hand dump cars.

Work will begin on the new Kansas City union station in about 60 days. That is the announcement made by officers of the company after making the preliminary financial arrangements. H. L. Harmon, president, and S. W. Morroe, general counsel, for the Kansas City Terminal Company, returned from New York Saturday night. Mr. Harmon confirmed the report that he has obtained a loan of 2½ million dollars from Kuhn, Loeb & Co. to begin work on the new union passenger station. Arrangements were also made by Mr. Harmon and Mr. Moore to place a bond issue of 15 million dollars on the New York market. "While in Chicago on the return I attempted to get the directors together for a meeting to authorize this bond issue," Mr. Harmon said. "I will return to Chicago Tuesday or Wednesday, when this meeting will be held and the bonds issued, then I will go on to New York and complete all the preliminaries with the bankers there to take the bonds. Very few things remain to be done before actual work on the station will be started. I should say that we will begin active operations within two months." Before the station ordinance can be made binding the company must file with the city an application for the vacation of streets and alleys that are provided for in it. This will be done, Mr. Harmon said, about February 1 and then the council must approve of the vacations by February 9. The work for the excavating for the station building will be one of the first things done by the terminal company after every preliminary has been finished. John V. Hanna, chief engineer for the company, said that it was the plan now to start work on the main building at the same time other improvements begin. He said that the closing of O. K. creek as a sewer and the grading of land to be used for tracks near the station site also would be started this spring.

Pat Hannon of Hannon & Hickey returned from the south. Nothing new.

Jas. Downey of Hodges, Downey & Co. reports their ballasting work on the Iron Mountain R. R. in Arkansas as getting along nicely.

By unanimous vote the stockholders of the Missouri Pacific-Iron Mountain system approved Tuesday a proposed bond issue of $175,000,000 to be used for the consolidation of 11 connecting lines and the improvement of the company's main railroad properties. Vice President C. S. Clark presided at the meeting and former Gov. Lon V. Stephens and Chas. P. Stanley of St. Louis acted as tellers. The shares of George Gould and other New York stockholders of the company were

voted by proxy, Mr. Gould being unable to come to St. Louis at this time. No other business was transacted at the meeting, the annual election of directors not being held until later. Of the proceeds from the new bond issue $9,000,000 will be used for the physical improvement of the Missouri Pacific system and $5,000,000 for the St. Louis, Iron Mountain & Southern. The execution of the big mortgage, according to officials of the company, provides the necessary financial machinery to develop the western territory of the Missouri Pacific and its branch lines.

J. A. Ware Construction Co., Houser Bldg., St. Louis, Mo., was awarded the contract for raising of the grade of the Santa Fe R. R. between Paul's Valley and Dougherty, Okla.

Geo. B. Vaughan of Kirkwood, Mo., is going to do all of the work secured by the J. A. Ware Construction Co. on the Santa Fe R. R. between Paul's Valley and Dougherty, Okla. Vaughan left here for Texas the other day to ship his outfit on to this work and expects to open an office at Paul's Valley about Feb. 1. He has 300,000 yards of rock and 500,000 yards of earth, quite a lot of it steam shovel work, to sublet.

A special election to vote upon an issue of $500,000 in bonds for the improvement of the water works system in Kansas City, Kas., will be called in the near future. The money is to be used in extending water pipes and mains. The city council and the water commissioners will meet one week from tonight to decide upon a date for the election. Various amounts, aggregating $36,438, were transferred by ordinance at last night's meeting of the council from the general fund and the extension and betterment fund to the contingent fund. The recent annexation of Argentine, the extension of the city limits on the west from Eighteenth street to Forty-fourth street and on the north to the Missouri river makes it imperative that the commissioners have more money. At present a large portion of these annexed districts are without protection from fires.

Costello Bros. report their work on the Big Four R. R. in Ohio getting along as well if not better than could be expected in this kind of weather.

The United States senate on Jan. 18 passed a bill extending the time for building the Edgewater bridge across the Kaw River at Kansas City. The Edgewater Terminal Railroad Co., a subsidiary corporation of the Missouri Pacific, was granted the right by congress two years ago to build a steel bridge across the Kaw River near its mouth and work was to begin this winter. The plans were approved by the War Department engineers for a structure to cost about ½ million dollars. A delay in starting work on the bridge, however, was caused by high water and also by the time consumed in financing the Missouri Pacific improvements now under way. The bridge is to be used in connection with the river front terminal system now building from a point on the Missouri Pacific near Quindaro to Gooseneck near the Hannibal bridge.

R. J. Lynch is at work every day that the weather permits on his Missouri Pacific job near Kirkwood, Mo.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Northern Pacific Ry. is stated to have seven corps of engineers in the field between Mott, N. D., and a short distance west of Miles City. There is one party working east and south from Hathaway, two between Marmarth and Tongue river, one in the Fallon creek country and the others east of the Little Missouri. These parties are independent of the Northern Pacific engineers working in the north side country west from Glendive and last heard of in the vicinity of Jordan, in the vicinity of which party a Great Northern outfit is also at work.

The Great Northern Ry. Co. has filed the plats for its Poplar branch in the U. S. land office at Glasgow, Mont. The plats are for that part of the proposed line north of the Fort Peck reservation, commencing about eight miles south of the Scobey post office and extending to the Canadian line. The plats of the balance of the line from Poplar to the reservation line have been filed with the Indian department, as the reservation does not come under the work handled by the U. S. land offices.

The Big Blackfoot Ry. Co. has filed its articles of incorporation at Missoula and will have its principal place of business in that city. The capital stock is $250,000, of which $500 is actually subscribed. The directors are John Gillie, L. O. Evans and C. F. Kelley of Butte and John R. Toole and Kenneth Ross of Missoula.

Huntley, Church, Boyington & McCoy, of Spokane, Wash., who have the contract for doubletracking the Northern Pacific Ry. between Billings and Huntley, have opened offices in the Stapleton Block, Billings, preparatory to beginning work. H. W. Church of the above company will be in charge. The contract is said to involve the expenditure of about $1,000,000 and will require considerable rock cutting as well as the construction of three tunnels.

The Boise-Butte Ry. Co. has been incorporated with a capital stock of $24,000,000, of which $500,000 has been subscribed, and proposes to build 418 miles of line from Boise, Idaho, to Butte, Mont. The stock subscriptions have been made by S. H. Bracey of Chicago, who pledges himself for $234,000; Fred A. Dolph, Chicago, $150,000; J. W. Giebert, New York; $50,000; John P. Hornaday Pittsburg, $50,000; J. E. Bell, Addison, Mich., $10,000; G. T. Wiswell, Chicago, $10,000; Charles Blackburn, Chicago, $1,000; Frank Weeks, Boston, $1,000; John M. Haines, $1,000; T. F. Holverson, $1,000; E. H. McAuley, $1,000. Shares are valued at $100 each. The company will maintain its principal office in Boise, Idaho.

The city of Lewiston will vote Feb. 1 on granting a franchise to John L. Bright for a new electric plant on Spring Creek.

The Board of Directors of the Great Northern R. R., have passed a resolution and filed it with the Secretary of State in Montana, announcing the intention of the company to build a line from Vaughn Station, 10 miles west of Great Falls, Mont., to the base of the Rocky Mountains. Construction work on the line, which was located last Fall, will begin at once. J. C. Patterson, St. Paul, Minn., is Assistant Chief Engineer of the company.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The following bids were received Jan. 11 by the Board of Water Supply of New York city for the construction of portions of the White Plains division of the Catskill aqueduct, the work to include three tunnels, aggregating 16 miles in length, and about 2.8 miles of cut and cover aqueduct. The work is located in the towns of Mount Pleasant and Greenburg, Westchester county, and 36 months are allowed for its completion: Pittsburg Construction Co., $2,205,852.50; Carter Construction Co., $2,435,628.75; J. F. Cogan, $2,326,530; Breuchard-Winston Co., $2,479,155; and David Peoples, $2,497,750.

According to a statement of D. C. Salverds, Rochester, N. Y., president of the proposed electric line to be known as the Rochester, Scottsville & Caledonia, actual work will be started soon. Capitalists who have been interested in the financing of the line are soon to make a report, their representatives having recently been over the proposed route. The original proposed route of the line was from Rochester to Caledonia, but the promoters were unable to get financial backing on account of the shortness of the line. It is now proposed to extend the line westward.

The consolidation agreement merging the New York, Westchester & Boston Ry. Co. and the New York & Portchester R. R. Co. into the New York, Westchester & Boston Ry. Co., capitalized at $5,000,000, was filed Jan. 18 with the secretary of state at Albany. The officers and directors are: President, Leverett S. Miller, New York; vice president, Thomas D. Rhodes, East Orange; treasurer, Augustus S. May, Bridgeport, Conn.; secretary, John G. Parker, New Haven, Conn.; directors, Leverett S. Miller, George H. Miller, J. Pierpont Morgan, Lewis Cass Ledyard, William Rockefeller, New York; Thomas D. Rhodes, East Orange; Charles F. Brooker, Ansonia, Conn.; Charles S. Mellen, James S. Hemingway, A. Heaton Robertson, New Haven; John H. Whittemore, Naugatuck, Conn.; Edwin Milner, Moosup, Conn., and Robert W. Taft, Providence, R. I.

The State Public Service Commission will hold a hearing on Feb. 9 on the application of the Manhattan Bridge Three-Cent Line for a certificate giving permission to construct and operate a trolley line from Flatbush and Fourth avenues, Brooklyn, to and over the Manhattan Bridge and through Canal St., Ne York, to the Hudson River, a distance of about five miles.

The Connecting R. R. Co., which is to build a line connecting the New York, New Haven & Hartford R. R. and the Pennsylvania R. R. terminals in New York City and which is controlled by the above companies, has acquired a clear right of way, varying in width from 80 to 100 feet, from the shore line, opposite Ward's Island, to the Glendale section, a distance approximating five miles. On the Westchester side sufficient land for the connection of the projected railroad with the New Haven & Hartford system has been purchased by the New Haven interests, and as soon as new plans for the bridge across Ward's Island have been approved by the Municipal Art Commission of New York City, work will be begun on the $25,000,000 improvements which will furnish facilities for residents of Jamaica, Flushing, Malba, Whitestone and eastern Long Island points to reach, from their home towns, all places on the Pennsylvania and New Haven roads. The first plans for the Hell Gate Bridge submitted by the Connecting company were rejected by the Art Commission on esthetic grounds. In the designing of new plans the points of objection will be considered by the architects. After the passenger connections between the two systems have been effected the freight road will be constructed to Bay Ridge.

Announcement has been made by Theodore P. Shonts, President of the Inter-borough Metropolitan Ry. Co., of New York City, that J. P. Morgan & Co. were ready to extend all the financial aid needed to the Interborough Rapid Transit Co., which operates the existing subways at New York, for new subways and other improvements that might be needed. Mr. Shonts said that the bankers were prepared to back the company to the extent of $100,000,000.

The State Board of Water Supply will give a hearing Feb. 10 to hear objections to the amended plans of the Board of Water Supply of New York City providing for a tunnel under the Borough of Manhattan, to connect with the new Catskill aqueduct. The amended plans will involve the expenditure of $25,000,000, although the engineers declare that the final cost will be kept within the appropriation for the new supply.

The Catskill Electric Ry. Co. of Catskill, has been purchased by W. C. Wood, and a new company will be formed to improve the road and make extensions. The first extension will be to Cairo and it is expected to have the line completed to that place by July 1. A new power station will also be erected and new cars secured. Among those interested with Mr. Wood are F. N. Du Bois, W. B. Fiero, Judge Emory A. Chase, Robert F. Story, Dr. Wilbur F. Lamont and George W. Holdridge of Catskill, manager of the trolley road.

It is reported that there is a plan under consideration to consolidate the Buffalo, Lockport & Rochester Ry. with the Rochester, Syracuse & Eastern and other holdings of the Beebe syndicate. If the road should be acquired by this syndicate, it would give control of the through electric service from Syracuse to Buffalo and probably result in the double-tracking of the Buffalo, Lockport and Rochester road. John M. Campbell, Rochester, N. Y., is General Manager of the Buffalo, Lockport & Rochester Ry.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The City Railways Co. of Dayton has accepted the council ordinance for the construction of a curve at the corner of 5th and Main Sts. This will permit the railway company to make an extension of its Kammer Ave. line or "Orange" line north on Main St. to Third and then east.

An allotment of $15,000,000 has been made by the New York Central lines for the Cleveland district.

The Cincinnati Traction Co. of Cincinnati will add two miles of new track to its line in the next few months.

The Washington Traction Co. of Springfield is considering extending its line to Clifton, Cedarville and Jamestown and possibly to Washington C. H. Steps are being taken to finance the extension and if successful construction work will be started in the spring. George W. Baker is president.

The Baltimore & Ohio R. R. is planning to start work in the spring on the elimination of grade crossings at Broad St., Town St., McKinley Ave., Sullivant Ave. and Central Ave. in Columbus. Paul Didier, Pittsburg, Pa., is principal assistant engineer, B. & O. R. R.

Right of way is being secured for the projected 51 mile line of Fostoria, Napoleon & Defiance Ry. Co., the incorporation of which was mentioned in our last issue. The road is to be operated by gasoline motors. Chas. A. Bliss and R. T. Betts, Toledo, O., are the principal promoters.

The town of Tiro has subscribed for $25,000 of stock for the proposed electric line of the Sandusky, Norwalk & Mansfield Ry. Co. and steps are being taken to secure stock subscriptions in other cities along the route. It is claimed that if the bonds are sold work on the line will be started early in April. As proposed the road is to extend from Norwalk to Bucyrus, Sulphur Springs, New Washington and Tiro. G. A. Bartholomew, Norwalk, is president.

The Toledo & Indiana Electric Ry. was purchased at receiver's sale at Toledo on Jan. 18 by S. C. Siehnck of Toledo, representing the majority bond holders, including the Knickerbocker Trust Co. of New York. D. J. Cable of Lima, O., supposed to represent the W. Kesley Schoepf syndicate, bid $1,058,000, supposedly with a view of obtaining a connection between Toledo and the Indiana property of that syndicate. The previous sale to the minority bond holders at $1,006,000 was set aside on technical grounds. The company operates from Toledo to Bryan, Ohio, a distance of 56 miles. Details of intended reorganization have not been announced, but are believed to include an extension to Fort Wayne, Ind.

At a meeting of the stockholders of the Lake Erie, Bowling Green & Napoleon electric road at Bowling Green the following directors were elected: Dr. S. W. Rogers, A. E. Boyce, F. H. McKnight, C. W. Solother, B. C. Harding and H. G. Hanky. It is stated that with ten days of good weather all the rails can be laid for the extension to Tontognay.

The city council of Cleveland has repealed the subway franchises passed as almost the last act of Tom L. Johnson's administration as mayor. The scheme for a $75,000,000 subway system was voted down by the people in November, but the franchises, in slightly altered form, were passed again by the Johnson administration.

The Findlay Interurban Ry. Co., Chas. F. Smith, General Manager, Findlay, has negotiations underway looking to the financing of an extension to Kenton.

The Cleveland, Cincinnati, Chicago & St. Louis Ry. is stated to be having surveys made for a proposed cut-off to run from Ridgeway to a point near Sidney, the idea being to do away with the hills and curves on the main line between Rushsylvania and Bellefontaine.

The Demay Construction Co. of New York has been awarded the contract for building the line of the Ashtabula Electric Street Railway Co., work to be begun within 60 days, and to be completed next summer. The proposed line will be about five miles long. The project is promoted by Ashtabula men and financed by eastern concerns which bought the bonds.

The Sylvan Dell Park Passenger Ry. Co., Williamsport, O., has applied to the city council for a franchise .

The Leetonia & Cherry Valley R. R. Co., of Leetonia, has been incorporated with a capital stock of $10,000, Warren E. Thomas being one of the incorporators.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Kansas City, Mexico & Orient Ry., W. W. Colpitts, chief engineer, Kansas City, Mo., is said to be planning to put engineers in the field shortly to make surveys for a branch line across southern Oklahoma to tap the coal fields in the southeastern portion of that state. The proposad branch will leave the Orient line at Cambridge, Kiowa County, and will be constructed southwest through Hobart and Lawton and across the Chickasaw Indian country. It is expected that active construction will be commenced during the present year.

Surveys for the Osage & Western R. R., a "Katy" extension, westward across northern Oklahoma, have been completed, running westward from Vinita through Nowata, Bartlesville, Pawhuska and Enid. According to a reported statement of F. G. Costello, one of the engineers for the company, construction work will be started within 30 days, building first into Bartlesville.

The Oklahoma City Junction Ry. Co., which proposes a belt line to the packing plant of Morris & Co. at Oklahoma City, is securing right of way for its line. The railway company is incorporated for $100,000, and according to the charter is to be ten miles long, reaching from Oklahoma City to the site of the new packing plant. Among the incorporators are C. B. Ames and D. T. Flynn of Oklahoma City.

A bill is now before congress to give the right of way across public lands in Arkansas for the projected Standard Oil Co.'s pipe line from the Oklahoma oil fields to the gulf of Mexico.

The Shawnee Electric Ry. Co., which plans to build an interurban line from Oklahoma City to Shawnee and on east to Muskogee, has filed with the secretary of state amended articles of incorporation increasing its capital stock from $100,000 to $1,300,000. The proposed line is to run northeast from Shawnee through Prague and Okmulgee to Muskogee and west from Shawnee through Dale, McLoud, Harrah, Choctaw City and Spencer to Oklahoma City. The directors are C. T. Edwards, A. Hargrave, J. W. Rubey, J. C. Chrisney, C. E. Easterman, R. E. Pugh and W. S. Pendleton, all of Shawnee.

Attorney Wm. M. Mellette, of Muskogee, has been appointed special master for the Monett Southwestern Construction Co. Announcement has been made by counsel for the construction company that a new company was being organized for the purpose of buying the assets of the defunct company and completing the building of the road which was started several years ago. The road was surveyed from Honey Grove, Tex., to Monnett, Mo., and part of the grading was done when it ran short of funds and was thrown in the hands of a receiver.

Officials of the Mountain, Valley & Plains R. R. Co., which projects a line from Cimmarron, N. Mex., to Guthrie, recently went over the proposed route and report everything favorable to the construction of the line. J. M. Cogan, Canton, O., is President of the company and D. W. Harrington, Dalhart, Tex., is Treasurer.

Permanent surveys are under way for the interurban road projected by Wood Bros. of Oklahoma City. As proposed the road will leave Oklahoma City on 4th St., pass near the state fair grounds through one of the canyons, under the Frisco and on to Jones or Spencer, perhaps both, thence southeast, coming down the valley beyond Choctaw and on to McLoud, missing Harrah by 1½ miles. From McLoud it goes to Dale, crossing the river at that point, thence to Rose Garden, a northern suburb of Shawnee. It enters the latter city over the city railway. It is proposed to go from there on to Fort Smith, Ark.

It is expected that construction work on the Cherokee Belt Line R. R. to extend from Skiatook to Pryor Creek, a distance of 45 miles, will be under way in a very short while. Already the right of way has been secured and practically every township along the proposed road has voted its assistance in the way of a bonus. It is believed the Cherokee Belt Line is backed by some trunk line traversing Oklahoma, presumably the Missouri Pacific.

According to reports from Guthrie, Okla., surveys have been completed for the Osage & Western, the Missouri, Kansas & Texas branch line, and construction work will be started in about three weeks. As projected the route will pass through Vinita, Nowata, Bartlesville, Pawhuska and Enid. S. B. Fisher, St. Louis, Mo., is Chief Engineer of the Missouri, Kansas & Texas R. R. Co.

The Kansas City, Mexico & Orient Ry. Co. is contemplating the construction of a branch line in Southern Oklahoma, from Cambridge in Kowwa County and through Hobart and Lawton across the Chickasaw Indian country to the coal fields in the southeastern portion of Oklahoma. Surveys for the line will be started in the Spring. W. W. Colpitts, Kansas City, Mo., is Chief Engineer of the company. A. E. Stilwell, Kansas City, Mo., is President.

According to a report, stated to have been made by A. Hargraves, General Manager, Shawnee Electric Ry. Co., work will be started at once on the active construction of the proposed line from Shawnee, Okla., to Oklahoma City.

The Tulsa Street Railway Co., of Tulsa, Okla., has decided to use a portion of the $100,000 allotted for improvements during 1910 for the construction of a complete loop to Owen's Park probably out Third and back North Cheyenne Ave. The Union Traction Co., of Tulsa, Okla., has also announced its intention of extending its Fourth St. Line to the Frisco track and north to Owen's Park.

The stockholders of the Oklahoma & Golden City Ry. at a meeting in Pawhuska recently elected directors and authorized the sale of the bonds so that actual construction work could begin this spring. This line will pass through Bartlesville from the northeastern part of the state.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

Bonds are being placed in New York for the proposed east and west extensions of the Pacific & Eastern Ry., of which J. R. Allen, 49 Wall St., New York, is president.

Advices from The Dalles state that S. Sarry will shortly commence work on his contract on double tracking the O. R. & N. between The Dalles and Biggs. Camps to accommodate 400 laborers have been erected at the mouth of Three Mile creek above The Dalles. Biggs is the northern terminus of the Columbia Southern.

Porter & Clarkson, who have the contract for constructing the Oregon Trunk up Willow creek, have three camps fully established between Madras and Deschutes, although they are not yet carrying very large crews, as it is difficult to get laborers to come in during the cold and somewhat uncertain weather. At the present time there is a force of about 150 men.

At the beginning of this month the first 10 miles of the new railroad to Brogan is practically graded, and finished ready for the ties and rails. Five camps are established along the line, with about 250 men and 400 horses on the work. The first camp is in charge of Hamilton, the second is McCue's, the third Hurley's, the fourth Yoackum's and the fifth Wells'. These have practically finished all their work on their first contract section and have moved up towards Brogan to take charge of another division on the road. About 10 teams are running from Vale with supplies to feed the men and stock and furnish materials needed.

Twohy Bros., Spokane, Wash., have been assembling crews for the work of double tracking the O. R. & N. line between Portland and The Dalles. This work, which covers 16

miles, includes a number of track changes and the elimination of many curves with the reduction of grades.

The Northern Pacific Ry. is reported to have purchased the holdings of the Oregon Coal & Navigation Co. on Coos Bay, contiguous to Marshfield. By its purchase the Northern Pacific acquires entry into Marshfield over what is termed the Boise-Roseburg survey. The survey, the engineers claim, does not exceed 3 per cent grade between Roseburg and Marshfield.

The Seaside Manufacturing Co., a lumber concern of Seaside, Ore., has filed a bond mortgage for $175,000 preliminary to building a railroad from Seaside up the Necanicum River to a junction with the P. R. & N. line now under construction between Hillsboro and Tillamook.

Smith & Jones, Portland, Ore., and Caughren, Winters, Smith & Co., Spokane, Wash., are making good progress with their contracts for constructing the Celilo Canal for the U. S. Government. The purpose of the canal is to form a waterway around Celilo Falls, about 100 miles east of Portland, making possible through river transportation for vessels of six feet draft to Wallula, Pasco and up the Snake River to Lewiston, Idaho. The canal plans call for five locks, one of which has been completed. Two of these locks will be at Big Eddy, arranged tandem plan and similar in construction, although much smaller, to those to be constructed on the Panama canal. About 350 men are now engaged in the work, which progresses night and day. The canal is being cut through basaltic rock and heavy blasts of dynamite are set off to break up this rock, so that it can be lifted by steam shovels into dump cars. An electric light plant supplies illumination so that the trains of dump cars and the steam shovels need not cease work when darkness comes.

The Oregon Electric Ry. Co., of Portland, has had surveys completed for a number of extensions and the engineers are now preparing maps and estimates. The surveys completed are for extensions aggregating 65 miles. The distance from Salem to Albany is about 27 miles, and from Tigard to McMinnville about 25 miles. The extension to North Yamhill from Forest Grove would be 13 miles. The latter is part of a proposed line from Forest Grove to McMinnville, but surveys have been completed only to North Yamhill. The Tigard-McMinnville and Forest Grove McMinnville surveys are not for alternative routes to McMinnville, but for independent lines to serve separate districts.

Active steps are being taken by the Nevada-California-Oregon Ry. Co., toward extending their line to Lakeview, Ore., and it is reported that a contract for grading 50 miles of the road has already been let to Nugent & Richardson.

The Oregon Railway & Navigation Co., it is announced, will soon start work on the long pending Coyote-Echo cut-off in Oregon and an appropriation of $707,946 has been made for the purpose. The line which will run from Coyote to Echo, via Stanfield, Ore., will eliminate 8.8 miles of present trackage. The work will include the construction of a 10-stall roundhouse at Coyote, which will be made a terminal. As stated in our last issue the company is to make an expenditure of $1,020,000 for straightening the line between Yoakum and Pendleton, Ore. G. W. Boschke, Portland, Ore., is Chief Engineer of the company.

Surveys, etc., for the Bandon & Port Orford Ry. which was projected to be built from Bandon down to Port Orford, in Curry County, has been sold to Seattle and Tacoma men, who intend to start actual work early in the spring. The road was promoted by Steven Henderson of Marshfield, Ore.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Pittsburg & Lake Erie R. R., J. A. Atwood, Chief Engineer, Pittsburg, is planning extensive improvements along its lines between Beaver and Pittsburg. These will include the rebuilding of the passenger and freight terminal at Beaver and the construction of freight yards at Woodlawn. Considerable grading has been done in connection with the new yards at Aliquippa, which will eventually be the largest on the Pittsburg and Lake Erie system.

Stell Bowman has been secured as Bookkeeper by D. J. Carson, Contractor, Du-Bois, Pa., for Parkwood work, on the Buffalo, Rochester & Pittsburg mine line.

The Pittsburg Subway Co., represented by Attorney Arthur O. Fording, Pittsburg, is to again apply to the city council for a franchise. The subway company's ordinances, which failed of passage after a fight lasting nearly two years, gave the company the right to build an underground railroad beginning at Oliver Ave. and Smithfield St. and extending to a point in the vicinity of Luna Park, near Center Ave. From there the road was to emerge from the hills and operate over proposed surface lines. Another spur was to be run under East End Sts. to a point near Fifth and Penn Aves. The downtown loop of the proposed subway carried it under Oliver Ave. to Liberty, to Ferry, to Third, to Smithfield St. and to the point of beginning.

The New York Central Lines are considering acquiring the Western Maryland R. R. which is planning the construction of a line to New Haven, Pa., from Cumberland, Md., making a connection with the Pittsburg & Lake Erie R. R., a subsidiary company of the New York Central, thus giving the W. M. Ry. system a direct connection with Pittsburg, Pa. The Pittsburg & Lake Erie R. R. is also considering the construction of an extension of its line to Belton, W. Va., where it will again connect with the Western Maryland R. R. J. A. Atwood, Pittsburg, Pa., is Chief Engineer of the Pittsburg & Lake Erie R. R.

Stockholders of the Indiana County Railways Co., at a meeting held Jan. 6, elected the following directors: D. H. Clarke and Benjamin M. Clarke, Punxsutawney, Pa.; George W. Kipp, of Towanda, Pa.; Harry E. Clarke, of Glen Campbell, Pa.; Hon. T. Larry Eyre, Chester, Pa.; W. F. Elkin and J. A. Klingensmith, Indiana, Pa. The board then organized as follows: D. H. Clarke, President; B. M. Clarke and T. L. Eyre, Vice Presidents; J. A. Klingensmith, Secretary and Treasurer. It is believed that the company will shortly let the contract for the construction of an extension from Clymer to Dixonville, Pa. It is also understood that the company is negotiating with the West Penn Railways Co., and that a link will be constructed from Derry to Blairsville, Pa., connecting the two systems.

The Hanover & Plymouth Street Ry. Co., has applied for a charter and proposes to build and operate a street railway, from Oxford street, in Hanover Township, Luzerne County, Pa., at the intersection of Lee Park avenue, thence in a westeerly direction along Oxford street to a public road leading from Wilkes-Barre to Nanticoke, commonly called the River Road; thence in said township on and along the River Road in a southwesterly direction to the Ferry Road leading to the Susquehanna River; thence in a westerly direction on and along the Ferry Road and Fellows avenue, to its terminus at the Susquehanna River; thence returning by the same route to the place of beginning, a distance of three miles.

Tennessee Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The surveyors for the Dyersburg Northern R. R. have finished making the survey from Tiptonville, Tenn., to Hickman, Ky., and have been surveying different routes around Hickman, Ky., to the east side. R. M. Hall, Dyersburg, Tenn., is president.

The Clarksville Railway & Light Co., of Clarksville, contemplates a number of improvements and the extension of the railway lines to New Providence and Dunbar's Cave. A. C. Murray is Manager.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Business men of Childress have organized the Childress & Northeastern Ry. and propose to build a road from Childress, Tex., to Mangum, Okla., through Hollis, Okla. The road is to be about 70 miles in length. The promoters intend to offer the road to the Katy or Rock Island at Mangum for operation, but it is possible that another line will ask for the lease. The new road will pass through the thickest settled portions of the Panhandle and southwestern Oklahoma. The country traversed is strictly a farming country, but mineral lands can be reached with no extra expense for tap lines. Six miles northeast of Childress is located one of the richest gypsum deposits in Texas. Surveyors will be put in the field as soon as possible and work of grading will begin within a few months, it is claimed.

Surveys are now under way for the Temple & Northwestern Ry., with Thurber as the objective point, via Hamilton. Walter S. McGregor, Temple, Tex., is right of way agent.

F. E. Jonah, chief engineer in charge of construction of the St. Louis & San Francisco R. R., has gone to Brady to take active charge of the construction of the Menardville extension. Mr. Jonah's first work in connection with the Menardville extension will be the selection of a route beyond the 17½ miles already selected and upon which the graders are at work. Three surveys have already been made into Menardville, and it is expected that one of the routes already surveyed will be chosen, although it is possible that an altogether new route might be selected.

According to a statement of Ben B. Cain, vice president and general manager of the Gulf, Texas & Western R. R., steel for the line has been laid 17 miles northwest from Olney in the direction of Seymour, and most of the grade for the entire distance has been completed. From Seymour westward the plans of the company are not matured as regards the route, and will not be until another survey is completed. Three towns are in competition for the railroad. These are Benjamin, Truscott and Crowell, all on the line of the Kansas City, Mexico & Orient. Mr. Cain states that it is the purpose of the company to build westward to a connection with the Santa Fe or to some point on the plains, but definite decision will be reached probably at the meeting of the directors and stockholders in Dallas the first Tuesday in February.

The James Black Masonry & Construction Co. of St. Louis, Mo., has been granted a permit to do business in Texas, with office at Austin. The capital stock is $5,000.

J. C. Dumont, the engineer who built the dam at Marble Falls, has submitted a proposition to the Business League of Austin for rebuilding the Austin dam. He proposes to finance the proposition, estimating the cost of rebuilding at about $350,000, and will ask the city to give him a lease of the water power and permit him the exclusive privilege of manufacturing electricity.

The city of Austin and the county are to expend about $12,000 in the permanent improvement of the South Austin dyke, each to pay one-half of the cost. A meeting of the city and county commissioners has been held to consider the plans and specifications. The work will be let to contract.

Cablegrams from Rotterdam to families of the crew of the dredge Holm at Galveston announce the safe arrival of that vessel in the home waters. The Holm steamed from Galveston Nov. 10 after several attempts to get to sea with a full crew. Two boats of the original fleet of four which engaged in the big grade raising contract still remain in Galveston. One of these, the Nerus, is still engaged in filling the canal made by the dredgers, and the other, the Triton, has been leased to the Bowers Southern Dredging Co. and is in use filling in new docks in the western part of the city. It is understood that the Nerus will soon follow the Holm back to the home of the company owning her.

The Atchison, Topeka & Santa Fe Ry. is stated to have perfected arrangements to come into Orange at an early date over the tracks of

the Orange & Northwestern R. R., the connection being made at Buna, where the two railroads are only a few hundred feet apart.

The Rockport & Port Aransas Channel & Dock Co. of Rockport has been incorporated with a capital stock of $2,500.

Application has been made for a charter for an electric line to connect Penn City and Houston. Grading for the line has already been started. C. C. Waller, Houston, is interested.

Surveys have been started at Belton under the direction of M. D. Parlow, Kansas City, Mo., for the projected Waco, Belton and Georgetown Ry.

J. W. McDaniel and associates have submitted a proposition to the Commercial Club of Temple, offering to build a line of railroad from Temple to Hamilton, provided the citizens would subscribe to bonds in the sum of $150,000, give right of way in the county and terminals in the city. The proposition will probably be accepted. The line is to be completed within two years and work will start within 30 days after the ratification of the contract.

Business men of Weatherford are advocating the building of a north and south railroad from that city. Joel W. Hicks, Weatherford, is interested.

The Picton Co., of Galveston, which has the contract for constructing the jetties at Sabine Pass for the U. S. Government, is preparing to begin active construction work.

The Bowers Southern Dredging Co., of Galveston is reported to have been awarded the contract for dredging a 30 ft. deep turning basin and slip for the private company at Texas City. Capt. A. P. Woolvin is at the head of the company which also projects a $40,000 hotel and a 500,000 bushel elevator at Texas City.

Good progress is being made by State Levee and Drainage Commissioner Styles, of Austin, for a comprehensive levee system for the state. Four plane table topographical parties are to be immediately placed in the field, and these additional parties are to commence work on the upper part of the Trinity river at Rockwell. These four additional parties will be under the supervision of Charles Hardeman, New York; Richard D. Evans, Washington, D. C.; J. E. Jenkins, Alabama; P. W. McMillan, Colorado. All of these experts are now connected with the U. S. Geological Survey. The rodmen and others who are to accompany these four parties will be taken from the parties that have been working on the base lines, which work has been completed. It was also announced by Commissioner Stiles that there will soon be started some new parties in the lower Brazos and will work up to Waco and also from Cameron along Little river. The rodmen for these parties will be obtained from the many applications now on file with Captain Stiles. The work of locating the surveys for the levees will begin at an early date.

The citizens of Bryan have accepted the proposition of O. E. Gammill, Contractor, of Gueydan, La., to build the Bryan College trolley line. Mr. Gammill has moved his grading outfits from Caddo, Okla., to the Bryan work.

Citizens of Midland have subscribed $100,000 bonus to secure a railroad for that city.

The Texas Central R. R. is planning to have grading work started by March 1 on its proposed 40 mile branch from De Leon through Sipe Springs and Rising Star to Cross Plaines. Definite locations for the line have been run. The Texas Central has ordered 5,000 tons of 80-lb. open hearth steel rails which will be placed in the present main line from Hico (to which point 80-lb. rail are now laid) to mile post 123, 18 miles west of Dublin. The present 60-lb. rail now in that track will be taken out and used in the construction of the 40 mile branch. C. N. Sharman, Waco, is chief engineer.

Complete surveys and cross sections are reported to have been made for a line of railroad from Paris to Palestine and the matter of constructing such a line is said to be under consideration by B F. Yoakum of the St. Louis & San Francisco. The project includes a joint trackage arrangement with the International & Great Northern from Palestine to Houston. The distance in an airline from Paris to Palestine is, approximately, 140 miles. The proposed route would cover an unoccupied territory in several places and be the only north and south line in that section.

A local company is being organized at Greenville to build a street car system in that city. A. R. Nicholson, Attorney, is working on the proposition. The construction of an interurban line for Greenville to Wolfe City is also proposed. Joseph F. Nichols is Mayor of Greenville.

At a recent meeting of the stockholders of The Trinity Valley & Northern R. R. Co., of Dayton, Tex., the Directors were authorized to issue first mortgage bonds amounting to $150,000 on the entire property of the company. The money will be used in the improvement and extension of the road and to repay money already thus expended. The line operates between Dayton and Fouts and connects with the Texas & New Orleans and the Beaumont, Sour Lake & Western roads. L. Fouts, Dayton, Tex., is President of the company, and A. J. Wise, Houston, Tex., is Chief Engineer of the road.

The Gulf Coast & Provident City Railway Co. has been chartered in Texas, with a capital stock of $50,000 and principal offices at Houston, Tex., and proposes the construction of a railroad 35 miles long from Pierce, in Wharton County, to Provident City, Colorado County. The incorporators of the company are Louis H. Scurlock, Emil Reinbold, T. J. Coughlin, Edward L. Walsh, all of Kansas City, Mo.; Carey Shaw, E. W. Townes, James T. Reaves, John T. McCarthy, A. Schlafli, Houston, Tex.; Friench Simpson, Hallettsville, Tex.

Citizens of Rising Star, Tex., have subscribed a bonus of $50,000 for the proposed line from Waco to Abilene, of the recently chartered Abilene Central R. R. Mogan Jones, Abilene, Tex., is one of the incorporators of the company.

At a recent mass meeting of the citizens of Pecos, Tex., a bonus of $100,000 was raised and guaranteed to Dallas capitalists promoting the construction and operation of a railroad from Pecos to Balmorhea. Construction work will begin at once.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Advises from Salt Lake City state that the mining interests of the Dolly Varden, Kingsley, White Horse and Ferguson districts in Nevada are taking steps toward the construction of a branch railroad from the camp of Proctor down the Antelope valley. Maps covering the territory along the line of these districts and as far south as Red Mountain have been prepared, together with statistical information as to the ore production and the possibilities of the districts. A preliminary survey was made some time ago, for the purpose of determining the general contour of this valley, which is in fact almost as level as a floor. The proposed branch will leave the main line of the Western Pacific railroad at or near Proctor, making this point a base of supplies for that part of Nevada.

The contract for tunnel No. 2 of the Kanab dam rebuilding project was let Jan. 11 to Sorenson, Averett and Ford Bros. of Kanab. The tunnel is to be 250 ft. long, 6 ft. wide in the bottom, 2½ ft. perpendicular walls and arched so as to make it 5 ft. high in the center. The formation is all sand rock, and the contract price is $2.45 per foot. The work must be completed by April 15. This tunnel will form the connection between the canal proper and the weir.

Plans are being prepared by Joseph West, Engineer, Ogden Rapid Transit Co., Ogden, Utah, for the construction of a railroad from the Utah Hot Springs north to Brigham City. Right of way will be secured and grading will commence at once. The company is also planning the extension of the Ogden Canyon line from Hermitage east through the great gorge to Huntsville, Utah.

The following statement regarding the recent washout on the San Pedro, Los Angeles & Salt Lake R. R., was given out by J. Ross Clark, Vice President, on Jan. 17: "The report that we were damaged to the extent of $14,000,000 by the flood waters is overdrawn. We suffered heavily, but not nearly to that extent. Repairs, construction and betterments together with loss of patronage sustained during the period of the break may, however, run the total up to something like that sum. The story that we lost 94 miles of track is also exaggerated, although a good portion of the track is gone for a distance of 60 miles. In places it is intact and can be replaced. It is hard to say when traffic will be resumed as the weather is too bad at present to attempt reconstruction. We have had one report on the damage and expect to send out two more engineering parties." E. G. Tilton, Los Angeles, Cal., is chief engineer.

The Southern Pacific Ry. Co. is taking steps toward raising the grade of their line across the Great Salt Lake in Utah. The work includes the raising of the trestle across the lake made necessary by the rise of the lake level. The work which will be in the vicinity of Ogden, Utah, will require an expenditure of about $1,000,000. William Ashton, Salt Lake City, Utah, is Chief Engineer of the lines east of Sparks.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Great Northern Ry., A. Stewart, assistant chief engineer, Seattle, is reported to be planning to discontinue the present division headquarters at Skykomish and to remove the roundhouses, shops and coal bunkers to Monroe. It is also proposed to construct switch yards, a mile in length, at Monroe.

The Anacortes Lumber & Box Co., L. D. Rogers, general manager, Anacortes, is to have work started at once on a dock, 725 ft. in length and 83 ft. wide, for the accommodation of freight and passengers. There will be coal bunkers, warehouses, a passenger station and electric hoisting machinery. A spur track of the new English railway will be built onto the dock.

The Commercial Dock Co., Carl L. Stebbins, president, Tacoma, Wash., is planning to have work started shortly on a new dock.

Twelve car loads of steel rails for the extension of the North Yakima & Valley R. R. into the Moxee country arrived in North Yakima on Jan. 10. Eight other cars of construction material are expected in a few days and work upon the extension will be pushed.

The Bellingham Warehouse Co. of Bellingham is planning to enlarge its dock at that city.

The Columbia River Orchard Co. has awarded a contract to Kilbourne & Clark, Seattle, for the construction of a pumping plant with which to irrigate a 15,000 acre tract near Wahluke. The contract calls for an electrically driven pumping plant consisting of four units of 10,000 gallons per minute capacity each, or a total capacity of 40,000 gallons per minute.

N. W. Miller, Engineer formerly employed on construction of the North Bank Road, has reported to Gov. Hay that the plans prepared for the Fidalgo quarry by State Highway Commissioner H. L. Bowlby of Olympia, are correct. As a result Mr. Bowlby will continue in charge of installing the machinery at that quarry. This settles the dispute between the state board of control and the highway department as to which should have charge of the work.

The Oregon & Washington R. R., according to an announcement of J. D. Farrell, general manager, Seattle, has work started on the construction of a terminal yard and shops at Tacoma which will cost $1,000,000. The creation of the yards, cutting down the edge of the bluff and filling in the swamp, will necessitate the handling of about 700,000 cu. yds. of earth.

Advices from Ellensburg state that a rough estimate made by W. S. Gamble from the report submitted by Harry Riddell places the cost of improvements and construction of the proposed tunnel on the Cascade canal, about five miles west of Ellensburg, at a little less than $300,000. Mr. Gamble's estimate and Mr. Riddell's report were read Jan. 10 before

the annual meeting of the stockholders of the canal company, in the Chamber of Commerce at Ellensburg. The estimate for the construction of the tunnel also included the removal of about 150,000 yds. of dirt on the hill above the proposed tunnel for the purpose of straightening the channel of the canal. The tunnel as estimated by Mr. Gamble is to be 2 1-6 miles in length.

Surveyors for the North Coast Ry., with E. S. Clark, locating engineer, are running a line from Camas Prairie and Gilmer valley, twelve miles north of Husum, down Gilmer creek to the White Salmon river toward Husum. Another North Coast survey crew of 30 has already arrived at Klickitat river on the way from Toppenish to Camas Prairie.

C. A. Kilbourne, Seattle, Wash., the eastern representative of the Wagner Electric Manufacturing Co., which proposes the installation of a $600,000 water power plant on the Columbia river near Seattle, is reported to have stated that providing the project proves a success, other plants will be installed in the United States and hinted that the Mississippi river in Missouri would be a favorable location for such a plant.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Right of way for the Maplehurst & Black River R. R. has been secured from a point at the junction of the Ladysmith branch of the Soo to Maplehurst, and construction work will be discontinued until March 1. According to a statement of an officer of the Saginaw Creek Lumber Co., which is building this road, the 15 miles will be completed and equipped by Jan. 1, 1911.

The Soo is stated to have acquired the Dalryample logging railroad, extending from Bayfield to within a few miles of Cornucopia, a distance of about 30 miles, and is said to be planning the line from Ashland to Superior via the logging road to Cornucopia and from the latter point to Superior by a new right of way which will soon be decided upon by the engineering department of the road. The new line, it is said, will follow the south shore of Lake Superior, touching at Port Wing, Orienta and other points along the lake which at the present time have no railroad facilities.

The common council of Sheboygan has passed an ordinance granting the Northwestern the right to construct a sidetrack in the Driving park addition in that city.

The Chicago & Northwestern Ry. has let a contract for cutting 20 miles of right of way through the Soo crossing north of the Wabeno branch, work to begin at once.

The stockholders of the Milwaukee Western Electric Ry. Co. have taken steps to amend its charter so as to permit of a 30 miles extension from Beaver Dam to Green Lake, in addition to the line from Milwaukee to Beaver Dam. The extension will take in Fox Lake, Markesan and Green Lake. The state railroad commission will be asked for a certificate of public necessity and convenience. It was also decided to increase capital stock from $200,000 to $1,000,000 and to ask permission for a bond issue to cover the stock.

The special committee of the city council of Milwaukee has approved the report of Isham Randolph, Consulting Engineer, Chicago, Ill., for the improvement of Jones Island, utilizing the present unoccupied frontage for dockage purposes. The committee approved the board of estimate's action authorizing a bond issue of $250,000 as a start on the Jones Island lock improvement. Assurance was expressed that the other funds would be forthcoming as the needs demand. Charles J. Poetsch is City Engineer of Milwaukee.

Frank Bainbridge, at present resident engneer of the Chicago & Northwestern Ry. at Clinton, Ia., has been placed in charge of the construction of the west end of the Milwaukee, Sparta & Northwestern Ry., the new Chicago & Northwestern line to connect Milwaukee and Sparta. As previously announced in this paper John R. Marsch, Chicago, Ill., has the contract for constructing the east end of the line. The Cleary-White Construction Co. has the sub-contract for the bridges on this section. Winston Bros. Co., Minneapolis, Minn., have the contract for the west half of the line.

Wyoming Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Union Pacific R. R., R. L. Huntley, chief engineer, Omaha, Neb., has filed plats in the U. S. land office at Cheyenne, Wyo., outlining the route from an extension of the company's Northport, Neb., line westward through Laramie and Albany counties to a connection with the main line at Medicine Bow, in Carbon County, Wyo. The route of the cutoff, as outlined on the plats, passes 60 miles north of Sidney, Neb., 85 miles north of Cheyenne and 20 miles north of Laramie. If the line is built, the construction of many tunnels will be necessary, the length of some of the contemplated bores being as follows: 15,500, 3,100, 800, 600 and 500 ft.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

It is expected that the dominion government will make an announcement shortly in reference to the proposed Hudson Bay railway and that construction work will start in the spring on that part of the proposed line from the Pass to Port Nelson. This line will, it is understood, be extended to Melville and make connection there with the Grand Trunk Pacific. A survey party is now at work in the district locating the line and a report is expected to be in the hands of the government at an early date.

Application has been made to the Canadian parliament by the Pacific and Northwestern Ry. Co. for incorporation, the project being to build a line from the vicinity of Chilkat Pass to the boundary of Yukon territory and Alaska, near the 63d parallel.

Wm. Mackenzie and D. D. Mann, president and vice president respectively of the Canadian Northern Ry. Co., are stated to have reached an agreement with the provincial government in connection with the contract for the construction of the line through British Columbia.

Phelan & Shirley of Omaha, Neb., who have an 80-mile contract on the G. T. P. west of the McLeod River, in Alberta, have started hauling in supplies. Six hundred men will be required to carry on the construction in April.

Orders for steel rails and other supplies for the construction of the Alberta & Great Waterways Ry. from Edmonton to Fort McMurray, are reported to have been placed with firms in Montreal and New York. The rails and supplies will be shipped to Edmonton early in the spring. The location of the first 50 miles of road has been completed, and the final location party to lay out the line from Lac La Biche to McMurray left Edmonton Jan. 11. The final location of the whole road will be completed by March. W. R. Clarke, Kansas City, Mo., is President and J. A. L. Waddell, Kansas City, Mo., is Chief Engineer.

Application is to be made to the Canadian parliament for a private act incorporating a railway company which intends building and operating a line to be known as the Howe Sound, Pemberton Valley & Northern Ry., and to amend the act of 1907 in respect to the company so styled.

Officials of the Canadian Pacific and the Minneapolis, St. Paul & Sault Ste. Marie Ry. Companies have decided to improve the old Wisconsin Central line, now known as the Chicago Division of the Soo. The line between Chicago and the Twin Cities will be shortened about 40 miles. The division between Menasha and Owen will be improved in order to make it capable of handling its traffic. Bonds for the improvements will be issued and all surplus earnings of the Wisconsin Central will be turned back into the property. Thomas Green, Minneapolis, Minn., is Chief Engineer of the Minneapolis, St. Paul & Sault Ste. Marie.

The Algoma Central & Hudson Bay Ry. Co., according to a statement reported to have been made by W. G. Franz, general manager, Sault Ste. Marie, Ont., will extend its line 200 miles northward to connect with the transcontinental line of the Canadian Pacific R. R., and surveys for the work are already under way.

The Pacific & Northwestern Ry. Co. is applying to the Canadian Parliament for incorporation, the project being to build a line from the vicinity of Chilkat Pass to the boundary of Yukon territory and Alaska, near the 63d parallel.

A traverse survey for the proposed line of the Canadian Northern Ry. through the Fraser river valley, between Hope, at the west slope of the Hope mountains, and New Westminster bridge, a trifle under 70 miles, has been completed and location work has been started. Further reductions in grades are expected after the completion of the location work. The maximum grade amounts to four-tenths of 1 per cent between Hope and a point farther down the valley, a distance of 14 miles, and even this grade occurs at only two or three places in two miles of that distance. The grade for the remainder of the route is virtually a river grade, equivalent to one-tenth of 1 per cent. Two small tunnels may have to be driven, one fifteen miles below Hope and the other at Sumas mountain. The river bank is followed nearly all the way down. The only exception is between Rosedale and Chilliwack, where the route has been located at a distance of about two miles from the Fraser. The entire line between Hope and the Yellowhead pass, via Kamloops, has been located with the exception of a stretch of 50 miles between Tete Jaune Cache and Yellowhead pass. Thomas H. White, Vancouver, B. C., is Chief Engineer.

Mexico Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Bids were opened Jan. 11 by James M. Reid, chief engineer, National Railways of Mexico, Buenavista, Mexico, D. F., for the grading, tunnel and masonry work on the proposed line from Durango to Llano Grande, state of Durango, approximately 100 kilometers.

The Franco-British syndicate of Mexico which was recently organized for the purpose of building the Guadalajara and Chamela R. R. is making good progress with its preliminary plans. The concession granted by the Federal Government for the proposed line is very favorable.

The Mexican Federal Government has formally approved the recently completed survey for the proposed Teziutlan & Nautla R. R., and it is said that grading work will soon be started. Leopoldo Villarreal and Ernesto Zorrilla, City of Mexico, have the concession. The road will run from Teziutlan, State of Vera Cruz, to the port of Nautla, situated about midway between Vera Cruz and Tuxpam. The road will be 100 miles long and will penetrate a region of great natural resources, including extensive coal fields, mahogany and other hardwood timber, oil and other valuable products. It will also afford an outlet for the vanilla and coffee plantations of that part of Mexico. The road will connect with the interoceanic line at Teziutlan. The government has under consideration plans for the development of the harbor at Nautla, with the view of making that place one of the chief ports on the gulf coast. It will be brought as close to the City of Mexico as Vera Cruz when the road is finished. The only rough country that the road will traverse is between Teziutlan and Tialpacoyan, about twenty miles. The survey calls for a maximum grade of 3 per cent.

The Tehuantepec National R. R. Co. has decided to double track its 193 mile line from Salina Cruz, the Pacific port, to Puerto Mexico, the Atlantic port, and has adopted plans for the work. The road is now operated by the firm of S. Pearson & Son, contractors, City of Mexico. W. B. Ryan, Rincon Antonio, Oaxaca, Mex., is vice president and general manager of the company.

The Louisville & Nashville R. R. Co. has appropriated $654,000 for the new shops that will be erected at Boyles, near Birmingham. Construction on the plant will be started at once, the site being cleared off already. T. E. Brooks, Birmingham, Ala., is Superintendent.

BIDS ASKED.

Bids are asked on following work, the notes being arranged alphabetically by states:

Bridges.

Baltimore, Md.—Until 11 a. m., Feb. 2, by Board of Awards, City Register's Office, for the delivery of timber for repairs to Light street draw bridge. J. Barry Mahool is President of the Board.

Edina, Mo.—Until 2:30 p. m., Feb. 8, by County Clerk, for the construction of three bridges as follows: 60 ft. span on 16-ft. steel tubes filled with concrete; 48 ft. span, bedstead pattern with 14 ft. approach; 44 ft. span bedstead pattern. The first two structures are to be in Fabius Township and the latter in Salt River Township. E. M. Randolph is Highway Engineer.

Oxford, N. C.—Until March 7, by County Commissioners for the raising an 85 ft. steel span 16 ft. higher and for constructing two 75 ft. steel spans one on either end of the present bridge. James Osborn is County Engineer.

Niagara Falls, N. Y.—Until 7:30 p. m., Feb. 1, by Board of Public Works, for the construction of an old Fourth St. bridge over Gill Creek at East Falls St.

Pendleton, Ore.—Until Feb. 3, by County Court for the construction of four steel bridges as follows: Across the Walla Walla river at McCoy's ranch, length 110 ft.; across Dry creek at Blue Mountain station, length, 50 ft.; across Butter creek near the mouth of Butter creek, length 40 ft.; across the Walla Walla river at Milton, length 90 ft. Frank Saling is County Clerk.

Vancouver, Wash.—Until 10 a. m., March 1, by M. B. Kies, County Auditor, for the construction of a 200 ft. steel span and two concrete piers and also for the construction of a 1,100 ft. trestle work over the Washougal River between the towns of Camas and Washougal.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Denver, Colo.—Until 3 p. m., March 15 (extension of date from Dec. 29), by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction (including plumbing and drainage), of the U. S. Post Office and Court House at Denver, Colo.

Washington, D. C.—Until noon, Jan. 27, by the District Commissioners, for the construction of an engine house No. 23, on G St., between 21st and 22d St.

Americus, Ga.—Until 3 p. m., Jan. 26. by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for supplying lighting fixtures for the U. S. public building to be used in the U. S. Building at Americus, Ga.

Athens, Ga.—Until 3 p. m., March 9, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the extension, remodeling, etc. (including plumbing, gas piping, heating apparatus, electric wiring and conduits), of the U. S. Post Office and Court House at Athens, Ga.

Savannah, Ga.—Until Feb. 14, by J. deBruyn Kops, Architect, Savannah, Ga., for plaster and terra cotta work on the Cathedral of St. John the Baptist in Savannah.

Boise, Idaho.—Until 2:30 p. m., Feb. 17, by Constructing Quartermaster, for constructing, plumbing, hot air heating and electric wiring of a single set of Non-Commissioned Officers quarters, brick with slate roof, at Boise Barracks, Ida.

Grand Rapids, Minn.—Until 10 a. m., Feb. 5, by County Commissioners, for the construction of a county jail at Grand Rapids and for furnishing all necessary labor and material for the erection of cell work. M. A. Spang is County Auditor.

Sandstone, Minn.—Until 8 p. m., Feb. 7, by Harry Madison, Secretary of the School Board, for the construction and completion of a school building. Separate bids will be received for heating, plumbing and clock work.

Meridian, Miss.—Until 3 p. m., March 2 (extension of date from Feb. 8), by James Knox Taylor, Supervising Architect Treasury Department, Washington, D. C., for the extension, remodeling, etc. (including plumbing, gas piping, heating apparatus, electric conduits and wiring and standard clock system), of the U. S. Post Office and Court House at Meridian, Miss.

Broken Bow, Nebr.—Until 7 p. m., Feb. 7, by L. H. Jewett, Secy., for the construction of a high school building.

Goldsboro, N. C.—Until 3 p. m., Feb. 25 (extension of the date from Jan. 31) by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction (including plumbing, gas piping, heating apparatus, electric conduits and wiring) of the extension to the U. S. Post Office at Goldsboro, N. C.

Eugene, Ore.—Until 3 p. m., Feb. 10, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, for the supply of lighting fixtures for the U. S. Public Building at Eugene, Ore.

Pawtucket, R. I.—Until 3 p. m., Feb. 21 (extension of date from Jan. 25), by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the extension, remodeling, etc. (including plumbing, gas piping, heating apparatus, electric conduits and wiring) of the U. S. Post Office at Pawtucket, R. I.

Lead, S. Dak.—Until 3 p. m., March 4 (extension of time from Feb. 4), by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction complete of the U. S. Post Office building at Lead, S. Dak.

Lynchburg, Va.—Until 3 p. m., March 3 (extension of date from Feb. 10), by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction of an extension, etc., except elevator (including plumbing, gas piping, heating apparatus, electric conduits and wiring and standard clock system), at the U. S. Post Office and Court House at Lynchburg, Va.

Madison, Wis.—Until noon, March 15, by Lew F. Porter, Secretary Capitol Commission, for the following branches of work for the finishing of the South Wing and South East and South West corner pavilions of the capitol building: carpenter work; mason work; stone and marble work; plumbing work; interior iron and metal work; elevators; ornamental glass work.

Milwaukee, Wis.—Until 4 p. m., Jan. 29, by Board of School Directors, Milwaukee, Wis., for furnishing all materials and labor necessary for the construction of a new school building on the north side of Scott St., between 25th and 26th Aves., in the 23d Ward.

Sheridan, Wyo.—Until 3 p. m., Feb. 10, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for supplying light fixtures for the U. S. Public Building in Sheridan, Wyo.

Winnipeg, Man.—Until Feb. 15, by M. Peterson, Secretary Board of Control, for the erection of the power terminal station at Winnipeg.

Toronto, Ont.—Until noon, Feb. 1, by H. F. McNaughten, Secretary Public Works, for the completion of the court house at Kenora. J. O. Reaume, Minister of Public Works, Department of Public Works, Ontario.

Monterrey, Mex.—Until Feb. 1, by Alfred Giles, Architect, San Antonio, Tex., for the construction of a reinforced concrete building for Edo. Bremer y Cia, Sucs. Monterrey, Mex.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

Collinsville, Ill.—Until Feb. 2, by Board of Local Improvements of tnis city for the construction of paving district No. 2, which includes about 10,000 sq. yds. of brick paving on 4-in. concrete foundation, and 5,000 ft. of natural stone curbing. The estimated cost of the work is $23,400. A. C. Powell, Collinsville, Ill., is Engineer.

Cherryvale, Kan.—Until 4 p. m., Feb. 7, by City Clerk, for about ½ mile of concrete curb and 1,500 yds. of brick pavement on cinder or gravel foundation. E. E. Bellamy is City Clerk.

Kirksville, Mo.—Until Feb. 7, by J. C. Carothers, City Clerk, for 6,000 sq. yds. of brick paving on five ins. of concrete base and 4,500 lin. ft. of concrete curb and gutter. Official advertisement will be found elsewhere in this issue.

St. Paul, Minn.—Until 10 a. m., Feb. 7, by Board of County Commissioners, for the following road improvements in Ramsey County: Grading and improving Manomin road from the Centerville road west to the Rice Street Cutoff; grading, claying and graveling the New Brighton road from the Long Lake road north and west to Station 35, to the south end of the gravel road; grading, claying and graveling Rice St. road from the Manomin road north and west to the Turtle Lake road; grading and macadamizing the Centerville road from the Manomin road north to the Anoka county line; grading and macadamizing the Lexington Ave. from the Manomin road north to the Turtle Lake road. Edward G. Krahmer is County Auditor.

Oxford, N. C.—Until March 7, by County Commissioners, R. W. Lassiter, Chairman, for the construction of 20 miles of county road. The work will include about 3,000 cu. yds. to the mile and vitrified pipe culverts.

Sewers.

Bids are asked on following work, the notes being arranged alphabetically by states:

Hebron, Neb.—Until Feb. 18 (readvertisement of bids called Jan. 12), by O. P. Hess, City Clerk for the construction of lateral sewers in Sanitary District No. 1, the work including 13,000 ft. 8-in. vitrified clay pipe, 12 flush tanks, 25 manholes, etc. C. H. Meeker, McCook, Neb., is engineer.

Hebron, Neb.—Until Feb. 18 (readvertisement of bids called Jan. 12), by O. P. Hess, City Clerk, for labor and material for the construction of a main and outlet sewer. The work includes 1,300 ft. of 15-in. vitrified clay pipe; 1,750 ft. of 10-in. vitrified clay pipe, etc. C. H. Meeker, McCook, Neb., is Engineer.

Washington, N. J.—Until noon, Feb. 14, by A. J. Craft, Borough Clerk, for furnishing all necessary labor and material for the construction of about 8 miles of vitrified pipe sewers from 8 to 18-in. in size, with Y branches, flush tanks, manholes and other appurtenances. Also for the construction of a sewerage disposal works, including piping, grading, etc. Charles B. Smith is Mayor. Official advertisement will be found elsewhere in this issue.

Niagara Falls, N. Y.—Until 7:30 p. m., Feb. 1, by Board of Public Works, for furnishing of material and construction of the following sewers: A tunnel trunk sewer in Cleveland Ave., from River Bank to Tenth St.; A sewer in Tenth St., between East Falls St. and Erie Ave.; a sewer in Portage Road, between Cedar Ave. and Buffalo Ave. Thomas H. Hogan is City Clerk, and R. A. McClanathan is City Engineer.

Louisville, O.—Until noon, Feb. 7, by Harry L. Rebrassier, Village Clerk, for furnishing all necessary labor and material for the construction of sewers and sewage disposal works. F. E. Myers, Canton, O., is Engineer.

El Paso, Tex.—Until March 3, (extension of time from Feb. 3,) by City Council for the construction of sewers and garbage disposal plant. Percy McGhee is City Clerk. Official advertisement will be found elsewhere in this issue.

Toronto, Ont.—Until Feb. 8, by G. R. Geary, Chairman Board of Control, for the construction of feeder conduit runs and manhole at Terminal Station.

Water Supply.

Bids are asked on following work, the notes being arranged alphabetically by states:

Haswell, Colo.—Well.—Until noon, Feb. 26, by Charles W. Comstock, State Engineer, Denver, Colo., for sinking an artesian well near Haswell, Colo. Official advertisement will be found elsewhere in this issue.

Cortez, Colo.—Well.—Until noon, Feb. 26, by Charles W. Comstock, State Engineer, Denver, Colo., for sinking an artesian well at or near Cortez. All proposals must be accompanied by a $200 certified check. Official advertisement will be found elsewhere in this issue.

Erie, Kan.—Until 3 p. m., Feb. 17, by City Council for the construction of a water works system, electric lighting plant and sewers. Burns & McDonnell, 804-23 Scarritt Bldg., Kansas City, Mo., are the Engineers.

Burlington, Ia.—Until 2 p. m., Feb. 17, (extension of time from Feb. 2) for furnishing necessary labor and material for the construction of a pumping station. Official advertisement will be found elsewhere in this issue.

Hebron, Neb.—Until Feb. 18 (readvertisement of bids called Jan. 12), by O. P. Hess, City Clerk, for the construction of improvements, extension and enlargement of the city water works system. C. H. Meeker, McCook, Neb., is Engineer.

Fort Robinson, Nebr.—Until 11 a. m., Feb. 19, by Capt. Malvern Hill Barnum, Constructing Quartermaster, Fort Robinson, Nebr., for furnishing all necessary labor and material for the addition to and repairing pump house, new boilers, new pump, etc., at Fort Robinson, Nebr. Official advertisement will be found elsewhere in this issue.

Dallas, Tex.—Reservoir.—Until 3 p. m., Feb. 16, by City Commissioners, for the construction of the White Rock Reservoir. The work includes a dam, pumping station, conduits and suction wells. Plans and specifications were prepared for the work by J. M. Preston, City Engineer. Work is also noted under Confirmed Reports.

Fort Mackenzie, Wyo.—Reservoir Lining.—Until 2 p. m., Feb. 14, by Constructing Quartermaster, for lining with waterproofing felt and vitrified brick a million gallon concrete reservoir near this post.

Miscellaneous.

Bids are asked on following work, the notes being arranged alphabetically by states:

Washington, D. C.—Light Vessel.—Until 2 p. m., Feb. 10, by Light House Board, Washington, D. C., for furnishing material and labor for the construction, equipment and delivery of a single screw, wood steam light house tender, Woodbine.

North Chicago, Ill.—Coal Handling Plant.—Until noon, Feb. 15, by Bureau of Navigation, Navy Department, Washington, D. C., for the construction of a coal crushing plant and an ash handling plant at the Naval Training Station, Great Lakes, North Chicago, Ill.

Kirksville, Mo.—Bonds.—Until 7 p. m., Feb. 7, by J. C. Carothers, City Clerk, for $10,000 of bonds.

Red Bank, N. J.—Bell Tower.—Until 4:30 p. m., Feb. 7, by W. A. Shoemaker, Architect, Red Bank, N. J., for the construction of a 65-ft. bell tower for the borough of Red Bank, N. J.

Blauvelt, N. Y.—State Rifle Range.—Until noon, Feb. 10, by State Board of Armory Commissioners, Albany, N. Y., for the construction, grading, telephones and scorers' desks for the New York State Rifle Range.

Madison, Wis.—Terrace Wall.—Until noon, March 15, by Lew F. Porter, Secretary of Capi-

tol Commission, for furnishing all necessary labor and material for the construction of a Terrace Wall of reinforced concrete about the North, South and East wings of the capitol now under construction.

Excavation, Earth and Rock.

Bids are asked on following work, the notes being arranged alphabetically by states:

Woodson, Ark.—Levee.—Until 10 a. m., Feb. 9, by Board of Directors, Woodson Levee District, at the office of Lund & Hill, 201½ W. Second St., Little Rock, Ark., for the following work: 9 miles levee including 165,700 cu. yds.; 8 culverts; 8 gates; flood gate, reinforced concrete. The work is estimated to cost $45,000. Work is also noted under Confirmed Reports.

Smartsville, Cal.—Ditch Work.—Until Feb. 5, by The Tarr Mining Co., Smartsville, Cal., for the excavation of the ditch of the Tarr Mining Co. Work is also noted under Confirmed Reports.

Colorado Springs, Colo.—Earthwork, Dam and Canal.—Until noon, Feb. 21, by Costilla Development Co., 56 Bank Bldg., Colorado Springs, Colo., for the construction as a whole or separately in Costilla County, Colorado, of the following: Sanchez Dam, about 500,000 cu. yds. earth work; Sanchez Dike, about 250,000 cu. yds. of earth work; Culebra-Sanchez Canal, about 250,000 cu. yds. earthwork; necessary controlling works and about 15,000 of rock excavation. Work is also noted under Confirmed Reports and an official advertisement will be found elsewhere in this issue.

Chicago, Ill.—Dredging.—Until 10 a. m., Feb. 23, by Maj. Thomas H. Rees, U. S. Engineers, Chicago, Ill., for dredging and rock excavation in the Chicago River, Ill. Official advertisement will be found elsewhere in this issue.

Anderson, Ind.—Until 10 a. m., Feb. 12, by County Surveyor, for the construction of an open ditch, including 4,826 cu. yds. of excavation. The cost of the work is estimated at $1,300.

Marksville, La.—Levee.—Until Feb. 1, by the Board of Commissioners of Red River and Bayou des Glaizes Levee and Drainage District, Marksville, La., for the construction of Davids Ferry South No. 2 Levee; Red River Right Bank; length of line, four miles; including 350,000 cu. yds. of material. A. E. Gremillon is Secretary of the Board. Work is also noted under Confirmed Reports.

Albany, N. Y.—Erie Canal Work.—Until noon, Feb. 16, by F. C. Stevens, Superintendent State Public Works, for Contract No. 48 Erie Canal, Sec. 8, including the construction of the canal from a point about 500 ft. east of Yellow Mills bridge to Wayne-Monroe county line 6.18 miles in length; for Contract No. 75. Secs. 9 and 10, including the construction of a guard gate superstructure as follows: About 1.3 miles east of Spencerport, near west line of Brockport, 1.5 miles east of Middleport.

Charleston, S. C.—Drain.—Until 11 a. m., Feb. 19, by Bureau of Yards and Docks, R. C. Holliday, Chief, Navy Department, Washington, D. C., for the construction of an intercepting drain at the navy yard in Charleston, S. C.

Materials, Machines, Supplies, Etc.

Bids are asked on following work, the notes being arranged alphabetically by states:

Washington, D. C.—Motor Repairs.—Until Jan. 29, by Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, Washington, D. C., for furnishing repairs for motor cars.

Washington, D. C.—Lumber.—Until Jan. 27, by Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, for furnishing 25,000 ft. of lumber, 4x4 S4S, 35,000 ft. of 4x12 S4S, and 50,000 ft. 12x12 rough. The material to be long leaf yellow pine or Douglas fir.

Washington, D. C.—Black Powder, Boilers, Rubber Belting, Etc.—Until 10:30, Feb. 4, by Capt. F. C. Boggs, General Purchasing Officer, Isthmian Canal Commission, Washington, D. C., for black powder, electric blue printing machine, vertical fire tube boilers, horizontal tension carriage, idler wheels, rubber belting, valves, pipe fittings, machinists' taps, pipe cutting and threading machine, steel filing cabinets, etc.

Chicago, Ill.—Transformer.—Until noon, Jan. 26, by Sanitary District of Chicago, I. J. Bryan, Clerk, for furnishing testing transformer and oil circuit breaker switches.

Columbus, O.—Power Equipment.—Until noon, Feb. 11, by the Board of Managers of the Ohio State Penitentiary for power equipment as follows: Two direct connected exciter units consisting of 75 h. p., simple horizontal automatic high speed engines, and 50 K. W., 125-volt direct current generator. George U. Marvin is Secretary.

CONTRACTS LET.

The following contracts have been let recently:

BRIDGES.

Russellville, Ala.—Bridge.—Joliet Bridge and Iron Works, Joliet, Ill., for the erection of a steel bridge across the head waters of Little Bear creek, in the southwest corner of the county.

Downieville, Cal.—Bridge.—George Grant, Quincy, for the erection of the new steel bridge across Canyon Creek between Plumas and Sierra counties.

Stockton, Cal.—Bridges.—M. B. White, Stockton, Cal., at $5,360, for the construction of the Mowry Ferry bridge, to be a 2-span pony truss, each span 75 ft. Western Bridge and Construction Co., Charles Ross, agent, Sacramento, Cal., at $11,060, for the construction of a bridge having 4 spans, pony truss, each span 70 ft. Both bridges are to have concrete abutments and steel tube piers. Bids were opened Jan. 3.

Buckley, Ill.—Bridge.—Joseph Klein, Freeburg, Ill., at $1,915, for the construction of the Kaufmann bridge on the line between Loda and Artesia townships.

Indianapolis, Ind.—Bridge.—American Construction Co., at $4,400, for the erection of a bridge over Pogues run at Commerce Ave. Bids were opened Jan. 14.

Stirlingville, Mich.—Bridge.—A. Y. Bayne & Co., Minneapolis, Minn., at $1,830, for the construction of a bridge across the Munoskong River at this place.

Bemidji, Minn.—Bridges.—Barabau & Hickcox, Minneapolis, Minn., for building bridges and culverts along the Moose Lake-Plummer line of the Soo railway.

Elmira, N. Y.—Bridge. — Lane Bridge Co., Painted Post, N. Y., is reported to have received the contract for furnishing the structural iron work to be used in repairing the hospital building at the reformatory in this city and Notebook.

Cincinnati, O.—Bridge.—F. J. P. Brackett, at $3,187, for the construction of a bridge over Bloody Run at Beech St., near Spring Grove Ave., Millcreek Township. Bids were opened Jan. 14.

Woonsocket, R. I.—Bridge.—J. C. Napoleon Bouvier, at $5,350, for the building of the bridge over the Blackstone River from a street running from River St. to the river. The bridge will be 100 ft. long and 25 ft. wide, and will be of wood with concrete abutments. A sidewalk will be constructed on one side of the bridge.

Nashville, Tenn.—Bridges.—Following contracts were awarded to the Joliet Bridge and Iron Works, Joliet, Ill., for the construction of five bridges: Cassatot bridge, $3,333; Saline bridge, $1,399; Mine Creek bridge, at $645; Brushy Creek bridge, at $476; Plum Creek bridge, $475.

ROADS AND STREETS.

San Diego, Cal.—Paving.—Fairchild-Gilmore-Wilton Co., at $.16.3 per sq. ft. or $1,896, for paving Union St., and at $.16.4 per sq. ft. or $2,293, for paving Front St. The paving on Union St. will cover 11,631.5 sq. ft., and on Front St. 14,060 sq. ft.

Palatka, Fla.—Road.—J. R. Emmerson, Gainesville, Fla, for the construction of a hard road 6 miles long from Palatka to Rice Creek. Bids were opened Jan. 6.

East St. Louis, Ill.—Paving.—Myers Construction Co., at $16,300, for the construction of pavement on 25th St.

Lake Forest, Ill.—Paving.—Edward M. Laing, Park Ave., Highland Park, Ill., at $12,699, for the following street improvements on Illinois Ave.: 4,400 cu. yds. excavation; 5,300 lin. ft. 6-in. drain tile; 2,300 lin. ft. 4-in. drain tile; 800 lin. ft. 8-in. drain tile; 200 lin. ft. 10-in. drain tile; 150 lin. ft. No. 2 sewer pipe; 30 catch basins; 50 cu. yds. masonry end walls; 25 lin. ft. masonry; 9,150 sq. ft. macadam; 9,000 ft. sod edge. Bids were opened Jan. 12.

Moline, Ill.—Sidewalks.—Anton Swenson of this city, at $4,790, for laying sidewalks in the city.

Springfield, Ill.—Paving.—Richard Egan, for the construction of pavement on College St., between South Grand Ave. and Laurel St., at $1.48 per sq. yd. for brick pavement and $.47 per ft. for curbing. Asphalt filler will be used.

Urbana, Ill.—Paving.—George E. Peter, Sycamore, at $6,450, for the construction of pavement on South Goodwin Ave., from Green St., to Nevada St.

Ishpeming, Mich.—Road.—Gust Fredin, at $4,240, for the construction of a little less than two miles of road north from the Michigamme River to the county line near Witch Lake. The contract includes the removal of the timber and the grading to a certain width.

Oxford, N. C.—Roads.—T. W. Chandler & Co., Virgilina, Va., for the construction of 11 miles of county road in Granville county.

Atlantic City, N. J.—Paving.—Bryant Reilley, at $196,000, for paving the Shore road, between Absecon and Somers' Point. The specifications call for an 8-in. macadam foundation and 4 ins. of amesite.

Gainesville, Tex.—Roads.—J. W. Maxey Engineering Co., Houston, Tex., at $100,000, for the construction of good roads in Precinct No. 1.

SEWERS AND WATER SUPPLY

Winslow, Ariz.—Sewer System.—American Light & Water Co., Kansas City, Mo., at $36,940, for the construction of a sewer system.

San Francisco, Cal.—Sewer.—Robert C. Storrie & Co., Fort Worth, Tex., at $168,700, is reported to have received the contract for the construction of the Hunter's Point sewer.

San Francisco, Cal.—Sewer.—Metropolis Construction Co., at $58,937, for the construction of the sewer in Fulton St., from 20th to 45th Aves.

Quincy, Fla.—Sewer System.—Sullivan & Long, Bessemer, Ala., at $18,994, for the construction of a sewer system in this city. The work includes 7½ miles of pipe sewers, 72 manholes, 20 flush tanks and one septic tank. Bids were opened Jan. 12.

Collinsville, Ill.—Sewers.—A. W. Eisenmeyer, at $15,300, for the construction of the improvement of Sanitary Sewer District No. 2, including septic tank, and the following approximate quantities: 10,727 lin. ft. of 8-in. vitrified pipe sewer, 4,017 lin. ft. of 10-in. vitrified pipe sewer, 1,379 lin. ft. of 12-in. vitrified pipe sewer, 120 lin. ft. of 12-in. standard cast iron pipe sewer, 36 brick manholes, 16 flush tanks, 10 vitrified pipe lampholes, 210 cu. yds. of concrete. Bids were opened Jan. 15.

Moline, Ill.—Water Mains & Sewers.— E. R. Harding, Racine, Wis., at $25,800, for laying water mains, and at $27,150, for the construction of sewers.

Rock Island, Ill.—Filter Plant.—Pittsburg Manufacturing Co., at $16,000, for the construction of the new 6,000,000 gal. filter plant.

Rock Island, Ill.—Sewer.—Pete Trenkenschuh, for the construction of the sewer on 14th Ave., between Sixth and Seventh Sts.

Indianapolis, Ind.—Sewer.—John E. Sullivan, at $1.73 per lin. ft., or $35,000, for the construction of the Parkway boulevard sewer. The work includes a main sewer in Parkway boulevard, from 18th to 30th St., with laterals in several cross streets.

Holton, Kan.—Sewer System, Disposal Plant. —Bids were opened Jan. 12, by this city, Wm. C. Bryant, Engineer, for constructing a sewer system and disposal plant, the contract being let to S. M. Kerns, Denver, Colo., at $41,366. The itemized bids received on this work were as follows:

Plaquemine, La.—Water Plant.—T. W. McDonald of Casey & Hedges' Boiler Works, Chattanooga, Tenn., for the construction of a new water works plant, consisting of two 80-horsepower boilers and a 50,000-gal. steel tower and tank, the tower to be ninety ft. high.

Muskegon, Mich.—Sewers.—Northern Construction Co., Elkhart, Ind., at $45,000, for the construction of eight miles of sewer in this city.

Saginaw, Mich.—Sewer.—W. N. Sager, at $8,622, for the construction of the Ellsworth St. sewer.

Gloversville, N. Y.—Sewage Disposal Plant.—A. L. Willey, Binghamton, N. Y., at $200,000, for the construction of a sewage disposal plant at this city.

Alliance, O.—Sewer.—In our issue of Jan. 12 we stated that the contract for constructing two miles of pipe sewer for this city had been let on 20, 24 and 30-in. vitrified pipe. This was incorrect, as the 30-in. pipe sewer, the largest item, was awarded on reinforced concrete pipe of the type of the Reinforced Concrete Pipe Co. of Jackson, Mich.

Sapulpa, Okla.—Sewer.—Summers & Stone, Oklahoma City, Okla., at $44,718, for furnishing all labor and materials for the construction of brick trunk sewer in this city. The work includes the following approximate quantities: 10,800 cu. yds. excavation, 1,100 ft. of 42-in. two ring brick sewer, 9,700 ft. of 66-in. two ring brick sewer, 850 ft. of 69-in. two ring brick sewer, 670 ft. of 78-in. three ring brick sewer, 600 ft. of 84-in. three ring brick sewer, 11 manholes and 9 inlets, 300 ft. of 24-in. vitrified sewer pipe, 52 yds. of concrete. Bids were opened Jan. 10.

Brownsville, Tex.—Sewer System.—N. E. Rendall, Brownsville, and P. D. Haley, Harlington, at $28,747, for the installation of a sewer system.

EXCAVATION, MISCELLANEOUS, MATERIALS.

San Francisco, Cal.—Police Station.—Board of Public Works awarded the following contracts: E. W. Elliott, at $38,396, for the construction of the Ingleside police station; William S. Snook & Son, at $2,976, for plumbing work in the Park police station, and at $3,095, in the Ingleside police station.

Jeffersonville, Ind.—Lumber.—E. W. Bartley, Racine, Wis., for furnishing the office of quartermaster with lumber as follows: 3,000 ft. ash, at $355; 10,000 ft. poplar, at $925. Delivery is to be made at Seattle, Wash.

Omaha, Neb.—Shutters.—Omaha Safe and Iron Works, at $1,160, for putting 38 fireproof shutters on the city hall.

Pittsburg, Pa.—Fixtures.—F. K. Montgomery at $5,000, by M. H. Dickinson, architect, Renshaw Bldg., Pittsburg, for the installation of the store fixtures and other alterations to the building at 418 Wood St., for the Union Electric Co.

Fort Sam Houston, Tex.—Sink, Pipe, Etc.—Following contracts were awarded by Capt. Fred H. Gallup, at the office of the Constructing Quartermaster: Federal-Huber Co., Chicago, Ill., at $453, for furnishing 6 kitchen sinks, type H-4; four type H-5; William G. Schuesirth & Co., San Antonio, Tex., at $6.40, for furnishing 8 brass ferrules; Jas. B. Clow & Sons, Chicago, Ill., at $20, for furnishing 24 ft. 2-in. lead pipe; 24 ft. of 1½-in. lead pipe; 20 lbs. metal wiping. Bids were opened Jan. 10.

Orange, Tex.—Foundation.—T. W. Ellis West Orange, for the cement foundation work for the electric power plant of the Yellow Pine Paper Mill Co., to be constructed in the southern part of the city between the two saw mills of the Lutcher & Moore Lumber Co.

Richmond, Va.—Electric Transmission Line.—Carolina Electrical Co., Raleigh, N. C., at $8,995, for furnishing all materials and labor for the construction of an electric transmission line. Bids were opened Jan. 17.

Aberdeen, Wash.—Water Pipe and Fittings.—The Crane Co., at $35 per ton for pipe, and $.03½ for fittings, for furnishing the following f. o. b. Aberdeen, Wash.: 250 lengths of Class C, 10-in. diameter cast-iron pipe; 12 lengths of Class C, 6-in. diameter cast-iron pipe; 2 10-in. cast tees; 1 10-in. by 8-in. cast tee; 6 10-in. by 6-in. cast tees; 3 10-in. non-rising steam hub end gate valves; 6 6-in. non-rising steam hub end gate valves; 6 6-in. ells hub and spigot ends; 200 lbs. first quality oakum; 5,000 lbs. pig lead. Bids were opened Jan. 5.

Dodgeville, Wis.—Cypress & Steel Tanks.—Following bids were received on cypress and steel tanks for this city: Cypress tank, 22'x24', Wendnagel & Co., Chicago, Ill., $1,950; Flint & Walling Mfg. Co., Kendallville, Ind., $1,450; Olson Bros., Chicago, $2,350; Minnesota Tank Co., Minneapolis, $2,000; American Tower & Tank Co., Elgin, Ill., $1,900. (A) Steel tank flat bottom, 22'x24', and steel tank 16'x35', hemispherical bottom (B). S. Freeman & Sons, Racine, Wis., A—$3,700, B—$3,000; Optenberg Iron Works, Sheboygan, Wis., A—$2,885, B—$2,838; Chicago Bridge & Iron Works, Chicago, A—$2,800, B—$3,290; Kennicott Water Softener Co. (awarded contract), Chicago Heights, A—$2,051, B—$1,738; The Canton Boiler & Engine Co., Canton, O., A—$2,721, B—$2,510.

Winnipeg, Man.—Wire, Gates, Posts.—Following contracts have been awarded for furnishing wire fence, posts and gates for fencing the Power Transmission line between Winnipeg and the Brokenhead River: Canadian Steel and Wire Co., Winnipeg, at $3,348, for wire fence and gates; Messrs. Weatherby & Eklund, Winnipeg, at $3,399, for cedar posts.

Hull, Que.—Pumps.—The William Hamilton Co., Ltd., at $14,850, for the construction of one set of Duplex and Triplex Power pumps, capacity 6,000,000 U. S. gals. per day, and turbine wheels for the operation of same. Bids were opened Jan. 12.

PROJECTED WORK.

Bridges.

Items Arranged Alphabetically by States.

Los Angeles, Cal.—City Council Committee is taking up the matter of constructing a viaduct over the Pacific Electric System on Mission road at Rosehill, and at the next meeting will recommend that the Board of Public Works make an estimate of the necessary expense. It is believed that $80,000 will be sufficient for the improvement, and that the electric railway company will share one-half the cost.

Woodland, Cal.—Board of Supervisors have under consideration the new contract submitted by the railroad company in relation to the combination bridge proposed to be constructed between Sacramento and Washington.

Montrose, Colo.—County Commissioners have decided to construct immediately a bridge over the Dolores River at Bed Rock to replace the one recently washed out by high water. The new structure will be about 125 ft. long and will cost about $4,000.

Washington, D. C.—District Commissioners have applied to Congress for an appropriation of $12,000 for repairing and strengthening the highway bridge across Rock Creek at Calvert St. The street railway using the structure will supply a like sum.

Savannah, Ga.—County Commissioners have adopted the plans of W. F. Brown, County Engineer, for the construction of a steel bridge across the Herb River on LaRoche Ave., above the Isle of Hope. The structure will be 108 ft. in length consisting of 6 panels with an 18-ft. roadway paved with 6-in. reinforced concrete and 5 ins. of macadam. The supports of the bridge will be reinforced concrete piers and the estimated cost of the work is $7,000.

Couer d'Alene, Idaho.—A delegation of property owners of Roselake, Ida., have petitioned the county commissioners for a bridge across the Coeur d'Alene River at Roselake.

Cambridge, Ill.—Board of County Supervisors have decided to take up the matter with the Board of Supervisors of Rock Island county of constructing a bridge across the Rock River at Colona. It is expected that an agreement will be made soon between the two boards.

Fisher, Ill.—Commissioners of East Bend and Condit Townships have taken up the matter with the County Commissioners to construct a new bridge over the Sangamon River at Newcomb Ford. The structure is estimated to cost $5,000, of which the county will pay one-half.

Jacksonville, Ill.—T. S. Davy, Chief Engineer of the Springfield-Jacksonville Traction Co., has decided to construct 17 bridges along the road which is now under construction. The structures will range from 100 to 500 ft. in length.

Moline, Ill.—Bill has been introduced into the House of Representatives asking for a charter for a new bridge between Bettendorf and Moline, Ill., for Edward VanPatten, Davenport, Ia. The structure will cost $1,000,000 and is planned to be about 1 mile long and constructed for the use of pedestrians and railway traffic.

Indianapolis, Ind.—Paul Julian, County Surveyor has recommended to the county commissioners that bridges costing $400,000 be erected this year. Among the bridges recommended are the following: Over Fall Creek at Delaware St., estimated at $100,000; over White River at New York St., estimated at $200,000; over Little Eagle Creek at Washington St., at $30,000.

Manhattan, Kan.—Board of Blue Township have called a special election for the purpose of voting bonds for the construction of a permanent wagon bridge across the new blue channel about 2 miles east of Manhattan, Kan.

Louisville, Ky.—The Kentucky & Indiana Bridge Co. is considering the reconstruction of the bridge at 32d St., linking the shores of Kentucky and Indiana on the Ohio River. Alexander P. Humphrey is Attorney for the company.

Shreveport, La.—City Council has passed an ordinance providing for the construction of a free bridge across Red River between Shreveport and Bossier Parish to cost about $200,000.

Millsdale, Mich.—Village Council and Township Board have adopted the plans submitted by the committee for the construction of a steel bridge with a cement foundation, and it was voted to appropriate $3,500 for the work.

Halstad, Minn.—Committees have been appointed to take charge of the matter of constructing a bridge across the Red River at this place. C. L. Sulerud is a member of the finance committee.

Minneapolis, Minn.—Bill has been submitted to Congress Committee authorizing the construction of bridges over the river at Third and Twentieth Aves., South. The estimated cost of the structures as planned will be $400,000 and $200,000, respectively.

Greenwood, Miss.—Board of Supervisors of Leflore county have authorized the County Treasurer, W. T. Chapman, to advertise for sale county bridge bonds for the purpose of constructing two steel bridges, one across the Yazoo River at a point near Shell Bluff, Miss., and one across the Tallahatchie River near Money.

Omaha, Neb.—Douglas County Commissioners have decided to spend about $50,000 for the construction and maintenance of county bridges.

Rochester, N. Y.—City Council is to pass upon the ordinance providing for the construction of a new bridge over the river at Central Ave. The proposed plans for the work involve the construction of a bridge of reinforced concrete 66 ft. wide to conform with the width of the street.

Cincinnati, O.—Preliminary work for the construction of the proposed Gilbert Ave. viaduct will be commenced early in the Spring. Bond issues for $540,000 have been provided by the Council for acquiring the land and constructing the viaduct.

Lima, O.—The question of constructing a viaduct over the C. H. & D., the Lake Erie & Western and the C. & E. tracks at South Main St. has been revived and steps are being taken to call a meeting of all parties who would be directly benefited by such an improvement.

Astoria, Ore.—County Court has been petitioned to construct a bridge across the Nehalem River between Jewell and Elsie. Surveys are to be made and estimates of the cost secured before action will be taken.

Portland, Ore.—A bill was introduced by Senator Heyburn Jan. 10, authorizing the construction of a bridge across the Kootenay River by the Bonner's Ferry Bridge Commission.

Beaver, Pa.—Promoters of which J. L. Holmes, Beaver, Pa., is chief, have submitted plans to the War Department for approval for the construction of a bridge over the Ohio River between Baden and Aliquippa. The structure as planned is estimated to cost $300,000. Ordinances from Baden and Aliquippa Councils are now being sought.

Gainesboro, Tenn.—Committee has been appointed to select a site, draw up specifications and to let the contract for the construction of the bridge across Martin's Creek at Granville, Tenn., for which the county granted an appropriation of $6,000. Another appropriation of $8,000 will soon be asked for the construction of a bridge across Roaring River at a point near its mouth about 2½ miles from Gainesboro.

Salt Lake City, Utah.—Jacob T. Raleigh Street Supervisor, has suggested that the old wooden bridge at Ninth St. be replaced by a modern steel structure. George F. McGonagle, City Engineer, estimates the cost of such a structure at $6,250. Raleigh also recommends that the Utah Light & Railway Co. be made to put in a steel structure across the Jordan River at Second South St.

Pasco, Wash.—Residents of Palouse Orchard have petitioned the Commissioners of Adams and Franklin counties to construct a bridge over the river at Palouse Falls.

Seattle, Wash.—Property owners and the Commercial club interested in the construction of the bridge over the Duwamish River at First Ave., are devising plans for starting work immediately on the structure. Board of Public Works rejected bids for the work several months ago. The bridge will be of steel and 16 or 30 ft. in width and is to cost not more than $35,000.

Spokane, Wash.—City Council has decided to authorize the Board of Public Works to advertise for bids for the construction of the Munroe St. bridge on the plan which eliminates the hump in the center of the structure.

Tacoma, Wash.—Committee of Streets and Alleys have recommended the City Council to reject all bids for the North 23d St. bridge and to have the Commissioner of Public Works readvertise for bids for the work.

Parkersburg, W. Va.—It is reported that the Board of Government Engineers have decided to allow the promoters to construct a new bridge over the Ohio River at this place. Hearing was held upon the proposition last month.

Ladysmith, Wis.—Common Council is considering a proposition made by the Menasha Woodenware Co. to construct a $12,000 bridge across the Flambeau River at Third St., providing the city reimburse the company before the expiration of 6 years. The proposed structure is to have a 16-ft. roadway and a 6-ft. walk.

Milwaukee, Wis.—Residents of the North Side are to hold a meeting to urge the aldermen to override the mayor's veto on the proposed bond issue for a bridge connecting Wright and Bradford Sts.

New London, Wis.—Plans are being submitted by a number of bridge contractors for the construction of a bridge over the Embarrass River. One plan calls for a concrete structure of 4 spans with 20 ft. roadway and 150 ft. in length.

Roads and Streets.

Items Arranged Alphabetically by States.

Huntsville, Ala.—City Council has passed an ordinance providing for the paving of Meridian St. from its present paving terminus to the city limits.

Montgomery, Ala.—An improvement association has been organized for the purpose of improving Lee St. It is planned to pave with

some material that will minimize the traffic noise.

Pine Bluff, Ark.—The rock macadam road contemplated to be built by Jefferson county will extend from Pine Bluff to a point east for about 20 miles.

San Diego, Cal.—Property owners have petitioned the city council to fix the width of the sidewalks on Randolph St. from Lewis to Hunter at 12 ft. instead of 10; also asking for permission to grade Randolph St. from Lewis to Hunter by private contract.

Fort Pierce, Fla.—J. E. Filtz, clerk of St. Lucis County, will sell bonds Feb. 7th in the amount of $200,000 for road improvements.

Pensacola, Fla.—Board of Public Works has ordered advertisements for a minimum of 20 and a maximum of 30 miles of new cement sidewalks prepared.

Tampa, Fla.—County Commissioners have appointed a committee to lay out the Tampa short line road to St. Petersburg.

Atlanta, Ga.—The street and road committee has been asked to appropriate enough money to grade and pave a block on Fourth St., between Juniper and Peachtree Sts.

Boise, Idaho.—Ada county is to hold an election in a few months to vote on a bond issue for the purpose of constructing good roads. The county recently accepted the enabling act making the County Commissioners a board of highway commissioners with large powers, including the employment of a road engineer, etc. R. L. Nourse, Boise, is President of the Ada County Good Roads Association.

Soldier, Ida.—The Commercial Club of this city is back of a movement to construct a wagon road to Atlanta at an estimated cost of $10,000.

Aurora, Ill.—The following thoroughfares are to be paved with asphalt this summer: Stolp Ave., Downer Place from Harrison Ave. to the city limits, Walnut and Benton Sts.

Chicago, Ill.—President Kolacek of the West Park Improvement Board has recommended to that body the improvement in the various parks and boulevards of the West Park system during the present year.

Pekin, Ill.—The Park Board has ordered the macadam driveways in the park extended to the eastern limits of the park, and the southeast part of the park improved.

Marion, Ia.—City Council has passed a resolution to pave the following streets: Ninth St., Sixth Ave. to Seventh Ave.; 10th St., Seventh Ave. northward to the corporate limits of the city of Marion; Central Ave., 10th St. to the westerly line of Seventh St.; 11th St., Seventh Ave. to 11th St.; the avenue extending from the north end of 11th St. to east line of 10th St.; 12th St. from Eighth Ave. to 14th Ave.; Eighth Ave., 12th St. to 10th St.; 10th Ave., Tenth St. to 12th St.; 13th St., Seventh Ave. to Eighth Ave.; Sixth Ave. from east line of 10th St. to east line of First St.; Fifth Ave., Eighth St. to 12th St.; 14th St., 12th St. to 11th St.; 11th St., Sixth Ave. to the railway track in First Ave.

Newton, Ia.—City Council has directed the city solicitor to draw resolutions for about 45 blocks of new paving to be laid next summer.

Vinton, Ia.—City Council has decided to pave a few blocks in the business section of the city. A commitee has been appointed to investigate the material to be used and the width that the street should be paved.

Louisville, Ky.—City Council has passed an ordinance to improve the unpaved portions of the sidewalk on the south side of Maple St., between 22d St. and 23d St., with brick.

Lynn, Mass.—Alderman Walter W. Pyne, chairman of the committee on street sprinkling, advocates the establishment of a municipal street sprinkling plant.

Saginaw, Mich.—Board of Supervisors of Saginaw county has ordered the Graham road in the township of Thomastown macadamized from the point where the road crosses the Pere Marquette railroad north a distance of two miles.

St. Paul, Minn.—Following estimates have been made by J. H. Armstrong, County Surveyor, to the Ramsey county board of commissioners for road improvements: For grading and macadamizing Lexington Ave. north from Manomin road to Turtle Lake road, at a cost of $13,285; improving Manomin road from the Centerville road to the Rice St. cutoff, at a cost of $5,042; graveling Rice St. road from Manomin road to Turtle Lake road, at a cost of $9,364; macadamizing and grading Centerville road from Manomin road to the Anoka county line, at a cost of $22,500; improving New Brighton road from Long Lake road to the end of the present grading, at a cost of $2,100. Bids will be advertised for soon.

Independence, Mo.—The county court has ordered the county highway surveyor to make an estimate of the cost of grading the road running from Lonejack 2¾ miles north and 2½ miles east.

Jefferson Barracks, Mo.—Bids for the construction of roads and walks, etc., have been rejected. Work will be readvertised. Capt. Stanley H. Ford, Quartermaster, is in charge.

St. Louis, Mo.—Senator Warner has introduced in the Senate the bill calling for an appropriation of $100,000 to build a national highway from the city limits of St. Louis to the cemetery in Jefferson Barracks Reservation.

Hastings, Neb.—City Council has ordered an election to be held on March 8 to vote on the issuance of $50,000 worth of paving bonds.

Omaha, Neb.—Commissioners of Douglas county have estimated the cost of the improvement of the road to be done during this year at $100,000.

Lakewood, N. J.—An automobile race course is planned for this city, to be about eight miles in length. Work is to be started at once. The estimated cost is more than $500,000.

Mays Landing, N. J.—A. L. Hilpott of Red Bank was the lowest bidder for the building of the county boulevard from Mays Landing to Tuckahoe, a distance of 12 miles, at $24,943.

Buffalo, N. Y.—Petition has been filed with the common council for the paving of North Division St., between Michigan and Spring Sts.

Syracuse, N. Y.—Commissioner of Public Works is prepared to submit to the common council estimates of the cost of paving Oxford St. from Cortland Ave. to Onondaga Creek with the different materials included in the general paving specifications. The estimates follow: Sandstone block, creosoted wood block or Hassam pavement with granite top, stone curb, $10,900; same materials, with cement curb or gutter, $10,200; asphalt sheet, vitrified brick or block, bitulithic bituminous macadam or Hassam cement concrete pavement, stone curb, $8,080; same materials with cement curb and gutter, $7,600; macadam, stone curb, $5,580; macadam, with cement curb and gutter, $5,300.

Rocky Mount, N. C.—Bunn & Spruill, attorneys, will sell bonds Feb. 7th amounting to $20,000 for road improvements.

Milton, N. Dak.—City will hold an election Jan. 25, to vote on the issuance of $4,000 worth of municipal bonds.

Akron, O.—City Council has declared it necessary to improve Spicer St., from Exchange St. to Wolf Ledge Run, by grading, curbing and paving.

Dayton, O.—Plans have been made for the construction of 12,487 sq. yds. of asphalt pavement. About 16,520 cu. ft. of combined curb and gutter of cement will be laid. The estimated cost of this improvement is $30,790. T. G. Cellarius is city engineer.

Springfield, O.—An estimate is being prepared by Engineer M. J. Bahin for the paving of South Limestone St., from Rice St. to the corporation line.

Zanesville, O.—City Auditor L. R. McCadden will sell bonds on Feb. 5 in the amount of $15,000 for street paving in this city.

Marshfield, Ore.—Petition is being circulated providing for the construction of a wagon road from Coos Bay to Roseburg, by way of Coquille and Myrtle Point. This improvement will mean an expenditure of $50,000.

Newport, Ore.—City Council has decided to improve Beach St., in Nye Creek, as soon as it is feasible.

Portland, Ore.—Property owners living on the Cornell road have filed a petition in the city auditor's office asking that the portion of that thoroughfare lying between Lovejoy St. and the west boundary of the city be taken over as a city street so that it may be improved.

Portland, Ore.—A movement has been started by the Waverly-Richmond Improvement club to form a hard-surface district between Division St., Powell Valley road, East 26th and 41st Sts., petitions being circulated in this district. The estimated cost of the pavements is $400,000.

Salem, Ore.—Marion county is planning on improving many roads this year.

Allentown, Pa.—Ordinance has been introduced in the city council for the paving of 16th St. from Turner to Gordon, and Third St. from Union to the bridge across the Little Lehigh.

Harrisburg, Pa.—A bill has been signed by the Mayor carrying $1,041,000 for parks, sewers, paving and other improvements. It will be submitted to the voters at the February election.

Pierre, S. Dak.—A movement has been started in this city for the construction of good roads.

Rogersville, Tenn.—J. R. Sanders, secretary of the pike commission of Hawkins county, will sell bonds Jan. 28 amounting to $40,000 for pike improvements.

Beaumont, Tex.—The village of Vidor, in Orange county, has plans for a wagon road from that place to Beaumont. The route will probably be surveyed in the near future.

Brownsville, Tex.—City Council has called a special election to be held March 8, to vote on the issuance of $30,000 worth of public improvement bonds.

Richmond, Tex.—County has voted the issuance of $150,000 road bonds to build macadamized roads to connect with the Harris county roads. A road will be built to furnish a driveway from this city to Houston.

Rotan, Tex.—City has voted the issuance of $15,000 worth of street improvement bonds.

Sherman, Tex.—Grayson County Commissioners have taken up the matter of passing on the orders for the bond issue in Road District No. 1, consisting of the Denison Precinct; $250,000 is to be expended for improvements in that district.

Aberdeen, Wash.—County Commissioners are planning on expending $100,000 on building and improving roads in Chehalis county in 1910.

Bellingham, Wash.—City Engineer Troutman has estimated the cost of repairing the roadway and bulkhead on West Holly St., between E and G Sts. at $1,000.

Olympia, Wash.—Commissioners of Thurston county have $37,100 to expend on the improvements of county roads during the year 1910.

Seattle, Wash.—The Orillia to the Pierce county line section of the macadamized highway, which is being constructed between this city and Tacoma, is to be built this spring at an estimated cost of $100,000. This section is 11 miles long.

Vancouver, Wash.—Petition has ben laid before the War Department asking for an appropriation of $25,000 for putting down a macadam pavement on the extension of Fifth St., passing through the Vancouver military reservation.

Burlington, Wis.—City Council has ordered the following streets paved with brick on a 6-in. concrete base: Chestnut St., from Geneva St. to the Soo Line railway; Pine St. from Geneva St. to Madison St. Board of Public Works, P. J. Hurtgen, chairman, will soon call for bids on this work.

Wausau, Wis.—Plans and specifications are being prepared for about 22,000 sq. yds. of brick or creosoted wood block paving. Contracts will be let early in the spring. O. A. Wennberg is Assistant City Engineer.

Sewers.

Items Arranged Alphabetically by States.

Colton, Cal.—Plans are being prepared by Will L. Brown, San Bernardino, Cal., for the construction of new sewers in this city. The work is estimated to cost $65,000.

Los Angeles, Cal.—Board of Public Works has recommended to the city council the construction of a storm sewer in Marmion Way at a cost of $10,297.

Roseville, Cal.—City is preparing to expend large sums for street improvements and the installation of a sewer system.

San Francisco, Cal.—No bids were received for the construction of the Yerba Buena sewer, for which $600,000 of bonds issue funds is available. Bids will be readvertised.

San Leandro, Cal.—The Western Pacific Railroad and the Best Manufacturing Works are planning on constructing a storm sewer along Alvarado St.

Atlanta, Ga.—The council committee on sewers has decided to petition the finance committee for appropriations as follows: For construction of lateral sewers as are not taken care of in the proposed bond issues, $20,000; for the extension of the Kennedy St. sewer, $8,000; for the proper drainage of Chestnut and Simpson St., $1,000.

Bushnell, Ill.—City is planning on constructing a sewer system. Septic tanks will be constructed on the east and west side of town.

Elgin, Ill.—Board of Local Improvements has passed resolutions for the Locust St. and Villa St. sewers. Both sewers will be constructed this spring. The engineer has estimated the cost of constructing the former at $9,140 and the latter at $5,786.

Rockford, Ill.—Board of Public Works has introduced in the city council an ordinance providing for the construction of a sewer in portions of the following streets: Sixth Ave., 15th, 16th, 17th, 18th, Charles, Shaw and State Sts., Rome Ave., Pearl St., South Chicago Ave., Baker St., Hutchins Ave., Third and Second Aves. and McCaughey St. The sewer will be about 15,000 ft. long and will be constructed of 12, 10 and 9-in. pipe. The cost is estimated at $14,801. An ordinance was also introduced providing for the construction of a sewer in Rockton and Garfield Aves., at a cost of $4,475.

La Porte, Ind.—Prof. R. L. Sacket, sanitary engineer of Purdue University, has submitted to the city council plans and specifications for the construction of a sewer system in this city. The sewer will be constructed of reinforced concrete, including the following sizes: 5,870.2 ft. of main trunk sewer, 78 ins. in diameter; 3,885 ft. of Fox St. sub-trunk 54 ins. in diameter; 897.3 ft. of Fox St. sub-trunk 48 ins. in diameter; 3,826 ft. of Kingsbury road sub-trunk 60 ins. in diameter; 1,031.5 ft. of Yellow River road sub-trunk 54 ins. in diameter; 363.5 ft. of Yellow River road sub-trunk 50 ins. in diameter. The sewer will be three miles in length and will cost approximately $126,947.

Corydon, Ia.—City is contemplating on installing a sewerage system at a cost of about $20,000.

Davenport, Ia.—City Engineer Murray has presented to the city council specifications and estimates for the new sewer that the city contemplates building between Marquette and Ripley Sts. along the levee front. The sewer will be 8 or 9 ft. in diameter and will be built of reinforced concrete. It will be about 4,400 ft. in length and will cost about $90,000.

Saginaw, Mich.—Board of Public Works has been petitioned by the Sommers Match Co. to lay a sewer in Rust Ave. to its new factory at Wilkins St.

Springfield, Mo.—City Council will again shortly consider the construction of a sewer in the district bounded by Center, Campbell, Pine and Boonville Sts.

Crete, Neb.—City is contemplating on installing a sewerage system.

Binghamton, N. Y.—City Engineer John A. Giles has submitted to the alderman plans for sewering the west end of the First ward.

Utica, N. Y.—City Council has ordered plans drawn for the construction of a sewer in North Genesee St. from its present termination in the old river channel to the intercepting sewer.

Bellefontaine, O.—City will soon engage an engineer to draw plans and prepare specifications for the construction of a sewerage system and disposal plant.

Bucyrus, O.—City has engaged a sanitary engineer to draw plans for the intercepting sewer and sewage disposal plant ordered by the state board of health.

Cincinnati, O.—Following approximate estimates of the cost of intended improvements were submitted to Public Service Director Sundmaker: Sewer in Baltimore Ave. and rights of way from the end of the sewer at Cummins' run, and in Casper St. to Yoast Ave., $36,823; sewer in Otte Ave. from Hamilton Ave. to the ravine east of Kirby road, $6,453; sewer in Cheviot Ave. between Daytona Ave. and Mozart St., $16,570; sewer in Irwin St. from McGregor Ave. to its southern terminus and the right of way south of and east of Reading road, $1,380; Beechwood Ave. from Cinnamon St. to Madison Ave., opposite Beechwood Ave.; sewer Madison Ave. from Beechwood Ave. to Vista Ave. in the ravine and right of way from the culvert under Madison Ave. north of Beechwood Ave. to the proposed sewer in Duck creek, also in O'Brien and Lavinia Sts., $15,925.

Cincinnati, O.—City Council has declared it necessary to construct a sewer in University court from Straight St. to a point 500 ft. north of Straight St., and Straight St. from University court to a point 100 ft. west of University court.

Middletown, O.—City Council has decided to proceed with the improvement of Garfield Ave. from Philadelphia St. to Fourth St. by constructing a sanitary and drainage sewer. Also by constructing a sanitary and drainage sewer in North St. from Charles St. to Grimes St.

Hominy, Okla.—City has sold $36,000 bonds voted for the construction of a water and sewer plant. Work of construction is to begin soon.

Lebanon, Pa.—Dr. E. H. Gringrich, health officer for this city, has recommended in his annual report for the city council the installation of a house sewerage system.

Parsons, Pa.—City Council has decided to hold an election in February to vote on the issuance of $50,000 bonds for the installation of a sewer system.

Pittsburg, Pa.—City Council has authorized the construction of a sewer on Warsaw St. from a point near McKee St. to the present sewer on Nimick place.

Memphis, Tenn.—Survey is being made of the southern and eastern portions of the city for a sewerage system. The territory covered by the survey is as follows: From Nonconnah creek, on the south, to Trigg Ave. on the north; from the Mississippi river on the west to Highland Ave. on the east. Plans are being prepared by City Engineer Weatherford.

Lubbock, Tex.—Plans have been made for the construction of about 15 miles of sewers. Contracts will be let about March. E. L. Datton, Juanita Bldg., Dallas, Tex., is engineer.

Houston, Tex.—Plans for the construction of the sanitary sewers to be constructed in the Second ward have been completed by Consulting Engineer F. L. Dormant. The main sewers are to run along portions of Runnels, Shepherd and York Sts. and Commerce Ave

Huntsville, Tex.—City Council has decided to construct a sewerage system.

Edmonds, Wash.—City Council has passed an ordinance providing for a system of trunk sewers, to cost about $17,000. City will hold an election Feb. 8 to decide whether the city shall be bonded to construct the sewers.

Garfield, Wash.—E. C. Murray of Colfax has submitted plans and specifications to the city council for the construction of a $15,000 sewage system. The plans call for the installation of over two miles of pipe, 3,270 ft. of 12-in., 3,140 ft. of 10-in., 3,800 ft. of 8-in. and 2,700 ft. of 6-in.; the construction of a tank 24x45 ft., 6 ft. deep, and two filter beds, 50x100 ft. each, the septic tanks to dispose of all night soil and other solid matter.

Seattle, Wash.—Plans are being completed for the lateral sewers for the Green Lake district by Engineer W. D. Barkhoff.

Burlington, Wis.—City Council has ordered plans drawn for the construction of sanitary sewers in the following streets: Chandler Blvd. from Wilmot Ave. to Edward St.; Edward St. from Chandler Blvd. to Perkins Blvd.; Chestnut St. from Origen St. to James St.; Herman St. from Chestnut St. to Lewis St.; James St. from Chestnut St. to Storley Ave.; Pine St. from Jefferson St. to Washington. Work will be commenced in the spring on the extension of the storm sewer system as planned and recommended by P. J. Hurtgen, city engineer.

Oconomowoc, Wis. Board of Public Works has been authorized to have storm sewers on Collins St., Main St. from the tracks to Milwaukee St., South St. and West Ave. laid so as to drain to Lake La Belle.

Water Supply.

Items Arranged Alphabetically by States.

Imboden, Ark.—City has decided to extend its water works system in the spring. No plans have as yet been made, but the work proposed is estimated to cost several thousand dollars.

Sacramento, Cal.—The American Canyon Water Co. has submitted to the Board of City Trustees a proposition to furnish the city with water from the north fork of the American City at $400,000 a year for 150,000,000 gals. daily and $2,500 for each additional million gallons.

Glenwood Springs, Colo.—City has voted to issue bonds for the purpose of purchasing the water system now owned and operated by the Glenwood Springs Light & Water Co.

New Britain, Conn.—Percy M. Blake, Engineer Water Department, has recommended the increasing of the water supply system.

Kissimmee, Fla.—City Council has passed an ordinance calling an election to bond the town for $43,000 for the purpose of installing a system of water works and sewerage.

Meridian, Ida.—An election is to be held Feb. 12 for the purpose of voting on the question of authorizing an issue of $20,000 for the construction of a water works system.

Centrallia, Ill.—City Council has authorized the making of preliminary surveys and estimates for water site at the Martins Branch.

Oakland, Ill.—An election is to be held soon to vote on the installation of a water works system.

Cherokee, Kan.—A special election is to be held to vote on issuing $6,000 of bonds for the extension of the water works system.

Missoula, Mont.—The proposition to issue $26,000 worth of water works bonds was carried.

Havelock, Neb.—City Council has approved plans and specifications as revised for the new sewer and water works systems and will vote on holding a special election for voting bonds amounting to $75,000 or $80,000 for the work.

Farmington, N. Mex.—The Town Board has decided to call a special election for the purpose of voting on a proposition of issuing $25,000 worth of water works bonds.

Cortland, N. Y.—Board of Water Commissioners have made arrangements to take over the water works system.

Fort Erie, N. Y.—Plans for the installation of a complete water works system for this place have been made and although the measure was beaten at the last election strong hopes are maintained for carrying it this time.

Binghamton, N. Y.—Plans for the new reservoir to be erected by the Water Board upon the side of Mount Prospect at North Mygatt St. are under way. The work is estimated to cost $2,000.

El Reno, Okla.—J. LaBryaer, Mayor, is to sell on Jan. 26 the following bonds: $50,000 city hall bonds, $20,000 fire station bonds, and $10,000 water works bonds.

Krebs, Okla.—The proposition to issue $50,000 worth of water works bonds was carried.

Cottage Grove, Ore.—J. W. Roberts, Consulting Engineer, has completed an estimate of the cost of the proposed gravity water system. Including the construction of a 300,000 gal. reservoir, the system will cost $103,319. The supply will be piped from a mountain stream 18 miles distant.

Portland, Ore.—Residents of the Mount Scott District have held a meeting to take steps toward securing the construction of a 20-in. water main from the Mt. Tarbor reservoir through the entire Mt. Scott and Woodstock District.

Salem, Ore.—George F. Rodgers, Mayor, has decided to have plans prepared to submit to the U. S. Engineers at Portland, Ore., for raising the intake pipe of the Salem Water Company above the slough.

Coudersport, Pa.—Borough is to submit to the voters at the February election the proposition of municipal ownership of its water works.

Harrisburg, Pa.—The Northern Cambria Water Company has been granted an increase of capital stock from $10,000 to $125,000. The company which operates in the north section of Cambria county is planning the construction of many improvements and the extension of its present system. The offices of the company are at Johnstown, Pa.

Huron, S. Dak.—City will hold an election Feb. 1 to vote on the question of issuing $30,000 of bonds for the installation of an adequate water works system.

White Lake, S. Dak.—City is to decide on definite plans at once for the installation of a municipal water works system. The work will include the erection of a 85,000-gal. tank on an 80-ft. tower.

Bristol, Tenn.—City is taking steps to get a new and more bountiful water supply and will expend $400,000 if necessary. It is planned to then use the old supply as an auxiliary source.

Tremonton, Utah.—Citizens of this town are considering the advisability of installing a water works system in that place.

Woodland, Wash.—The Woodland Water and Power Co. of Woodland, Wash., has been incorporated with a capital stock of $40,000. S. A. Burns, E. L. Burns and G. F. Gilluly are the incorporators.

Burlington, Wis.—City Engineer P. J. Hurtgen is preparing plans for the extension of the water works system on several streets in this city.

Tofield, Alta.—Engineer Tait of the Grand Trunk Pacific is preparing plans and making surveys for the proposed water supply plant from Beaver Lake to Tonfield, a distance of two miles.

TRADE NOTES.

The Wood Drill Works of Paterson, N. J., has shipped another No. 5 drill to be used in the quarries of the Luzerne County Crushed Stone Co., Luzerne, Pa., with a guaranteed capacity of 50 ft. with a 4 in. hole at the bottom.

Henry J. Siewert and Christian Callsen have purchased the entire stock of Hans Blase in the H. Blase Co. and hereafter the business of this firm will be conducted under the name of the Siewert-Callsen Co. The present location at 3863 Milwaukee Ave., Chicago, Ill., will be retained, as Messrs. Siewert & Callsen have also purchased from Mr. Blase his holdings in this property. The company will carry on a cement contracting business.

The Good Roads Machinery Co., Inc., Kennett Square Pa., which has been actively engaged in the sale of road building and contractors' machinery since 1896, has recently concluded arrangements whereby it will hereafter have the exclusive sale of the entire output of the road and street making machinery, contractors' tools and supplies manufactured by the Climax Road Machine Co., Marathon, N. Y.; the Monarch Road Roller Co., Groton, N. Y., and the Indiana Road Machine Co., Fort Wayne, Ind., in addition to that of the American Road Machine Co., of Kennett Square, Pa.

WANTED—POSITION — Timekeeper, thoroughly experienced, desires position anywhere in the United States. A No. 1 credentials. Frank Rogers, 83 Schermerhorn St., Brooklyn, N. Y. 4-1t

WANTED—POSITION with some contractor or railroad company as general foreman of track laying or surfacing. Can give good reference as to my ability in working large gangs of men. I have had 25 years' experience in track work. Address John Steinhour, Ottawa, Putnam Co., Ohio. 4-1t

WANTED—POSITION—Technical graduate (28) desires position as transitman, levelman or masonry inspector. Has one and one-half years' experience. Open for position February 15. References furnished. Address Box 242, care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 4-3t

WANTED—POSITION as rodman. High school graduate; two years' experience. Will go anywhere on any work, but western location preferred. Address Box 243, care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 4-1t

WANTED—POSITION by young civil engineer (27); technically educated; one year's experience as instrumentman on municipal, subdivision and river surveys; will consider engagement in any line of civil engineering work; salary consideration of less importance than permanency of position and opportunities for experience; any location. Address Box 240, care of Engineering-Contracting, 355 Dearborn St. Chicago. 4-4t

WANTED—POSITION as steam shovel engineer; eleven years' experience with Marion, Bucyrus and Vulcan; can repair and keep up any class of machinery. Am not afraid of work; always ready to assist. Sober and reliable and can furnish references. Please state salary per month. Five days' notice if possible. Address W. M. Steel, Gary, W. Va. 4-2t

WANTED — POSITION — Superintendent building construction. Young man, fourteen years' practical experience in office and outside work. University education. Can design, detail, write specifications and superintend construction; able to take off quantities from plans and make estimates. Experienced in reinforced concrete. Desire position with architect or contractor. Only permanent position considered. References. Location southwest, west or south. Address Box 241, care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 4-4t

WANTED — POSITION by an experienced locomotive crane and skid excavator operator; can give references. Address Ulysses G. Cook, Martinsville, Ill., P. O. Box 366. 4-1t

WANTED—POSITION—Engineer (47); 27 years' experience on location and construction of railways, grading, masonry, trestling, tunneling and track laying, desires position as foreman, superintendent or engineer with contractor or railroad on concrete construction, piers, abutments, culverts and pavements; south or west preferred. Have instruments. Moderate salary. Address W. B. H., 1015 Bullitt Ave. S. E., Roanoke, Va. 4-6t

WANTED—POSITION—Engineer or superintendent of track, 6 years' preliminary location, instruction, land and municipal work, paving, drafting, estimates, etc.; 2 years' charge of street and suburban railway construction, maintenance, repairs and renewals. Can organize and handle work at minimum cost. Address Box 244, care of Engineering-Contracting, 355 Dearborn St., Chicago. 4-2t

WANTED—POSITION—Young man, graduate civil engineer, two years in charge of steam shovel work and concrete construction; one year building construction; two years instrumentman on railroad location and construction; office and field work. Will consider proposition for other connections where successful results will be recognized. Address Box 245, care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 4-1t

WANTED—POSITION with company laying underground cable conduit. Am 31 years old. Have executive and managing experience. Capable, reliable; best of references. Address Box 237, care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 3-4t

WANTED—POSITION with contractor doing reinforced concrete or drainage work by young engineer, aged 23. Six years' general experience. Can go at once. Address E. L. B., care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 3-3t

WANTED—POSITION in North or West by engineer. Seven years' experience. Five years of it on railroad work, doing location, construction and maintenance. At present engaged on levee proposition. Ready to make change any time after Feb. 1. 28 years of age. Address Box 232, care of Engineering-Contracting, 355 Dearborn St., Chicago. 2-4t

WANTED — POSITION — By experienced timekeeper. Will go anywhere. Address H. C., care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 2-3t

WANTED—POSITION as office engineer with large engineering or contracting firm. Position to be permanent. Correspondence solicited. Address "East," care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 2-4t

WANTED—POSITION—Contractors' superintendent and engineer (34) with ten years' experience in building bridges, tunnels and all kinds of massive and reinforced concrete construction, location and grading for electric and steam railroads; able to organize and handle large forces. Open for immediate employment. Address Box 238, care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill.

WANTED—POSITION as superintendent or tie and timber inspector for cross tie work. Have had experience in cutting white oak, post oak, cypress and long leaf pine, for construction and repair, and the latter for export; fifteen months' experience in operating the improved cross tie machine. Desire to locate west of Mississippi River. As to character, etc., guarantee satisfaction. Address Hunter Bowen, Pinckard, Ala. 26-6t

POSITIONS VACANT

WANTED—Stenographer, draftsman, general superintendent and other help. Each must be thoroughly capable. Can't use the ordinary kind. Good pay and opportunity to the limit of your ability. No reply until something of interest is presented. Bartlett & Kling, Builders and General Contractors, Cedar Rapids, Iowa. 4-1t

WANTED — Young graduate civil engineer for a position on the editorial staff of Engineering-Contracting. The position is one which calls for energy and push and the disposition and ability to work hard, quite as much as for technical training and literary ability. The opportunities are good for a man who can handle the work. Editor, Engineering-Contracting, 355 Dearborn St., Chicago.

WANTED — Two thoroughly competent building estimators in office buildings, hotels and large office building propositions generally. Men with drafting experience preferred. State experience and salary expected. Address Box 236, care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 3-2t

WANTED—A contracting engineer to act as general manager for an incorporated company who are doing special work in municipal and industrial lines. Must be able to close contracts. Must have $10,000 to $25,000. Salary $3,000 per year. Will make a term contract with right man. Address P. O. Box 181, Houston, Texas. 3-2t

WANTED—SALES MANAGER by company manufacturing concrete mixers. Only those familiar with this line and possessing selling experience need apply. Address Box 219, care of Engineering-Contracting, 355 Dearborn St., Chicago. 24-tf

WANTED—POSITION as cook for man and wife in camp. Years of experience. White. State wages. Mrs. Sarah Babcock, Sullivan, O. 2-5t

WANTED—EXPERIENCED TIMEKEEPER for work in southern Illinois. Give experience and references. Carter Construction Co., Room 218, 184 La Salle St., Chicago, Ill. 2-2t

SUPERINTENDENT on big work wishes to go into the contracting business. Have had experience on railroad construction, dam construction and heavy concrete work. Can use pick, shovel and spike maul and show how to use them. Graduate civil engineer. Age 32. Have $2,500 to invest on the co-operative plan and am willing to handle gang, take charge of work, draft or make estimates. Correspondence solicited. Address Box 230, care of Engineering-Contracting, 13-21 Park Row, New York, N. Y. 1-5t

WANTED — Capable experienced superintendent for heavy concrete construction company operating on Pacific Coast. Give full information as to experience, references and salary expected. Address Box 226, care of Engineering-Contracting, 355 Dearborn St., Chicago, Ill. 26-4t

MISCELLANEOUS WANTS

Cards under this heading cost only

WANTED—Address of firms who build mole or underground ditches. Address J. A. Campbell, Vermillion, S. D. 4-1t

WANTED—Would like to invest some capital, plant and services with some good wideawake contract firm to do concrete work; experienced as engineer and contractor; where work is right can produce results, but do not profess to do the impossible. Wire or write James Dickey, Covington, Va. 4-1t

WANTED—Work for two good concrete outfits with capacity of from 75 to 100 cubic yards per day; plants in good condition and can move on work at once. Personal attention given any and all work. Wire or write James Dickey, Covington, Va. 4-1t

WANT to get in communication with good sober machine plow man and machine driver for next summer's work. John Benson preferred. Address J. McLoughlin, Blunt, S. D. 4-2t

TO LET—About 30,000 yards grader and wheeler work; short hauls and nice work; seventeen cents, with one cent overhaul after five hundred feet. Ware & Spencer, Bosworth, Mo. 3-tf

WANTED—PARTNER with ten thousand cash and fifteen thousand at command to purchase half interest in an established general contracting business. Correspondence invited. Address Box 233, care of Engineering-Contracting, 355 Dearborn St., Chicago. 2-4t

We have fresno, wheeler and grader work to let on the following lines in North Dakota: 66 miles on the C., M. & St. P. Ry.; 40 miles on the N. P. Ry. Free transportation for outfits, teams and men over the above lines. Address E. A. Wickham & Co., Council Bluffs, Ia. 2-3t

We have 150 miles of fine grader, fresno and wheeler work to let on the C. & N. W. Ry. in South Dakota. This is fine work in a good country. We can use both small and large outfits. Free transportation for teams, outfits and men over the C. & N. W. Ry.
E. A. Wickham & Co., Council Bluffs, Ia.
Roberts Bros. & Wickham, 123-125 La Salle St., Chicago. 2-3t

WANTED—An experienced railroad man to take from $5,000 to $10,000 stock in an incorporated company and act as superintendent with salary. Address P., care of Engineering-Contracting, 355 Dearborn St., Chicago. 1-4t

WANTED—100 additional teams about March 1st for full year's work. Double tracking on Norfolk & Western Ry. Address J. S. Slone, Kingston, Ross County, Ohio. 1-4t

STRUCTURAL DRAFTSMEN

American College Graduates with one or more years' experience in this line of work preferred. The very HIGHEST SALARIES PAID depending upon experience, BETWEEN $90 and $150. WESTERN LOCATION.

THE ENGINEERING AGENCY, Inc.

Established, 1895 Monadnock Block, CHICAGO, ILLINOIS

EARTHWORK DAM AND CANAL.

Colorado Springs, Colo.

Sealed proposals will be received at the office of The Costilla Estates Development Company, 56 Bank building, Colorado Springs, Colo., until 12 o'clock noon, February 21, 1910, for the construction as a whole, or separately, in Costilla County, Colo., of

The Sanchez Dam, about 500,000 cu. yds. earthwork.

The Sanchez Dike, about 250,000 cu. yds. earthwork.

The Culebra-Sanchez Canal, about 250,000 cu. yds. earthwork. Together with necessary controlling works and about 15,000 cu. yds. of rock excavation.

The company reserves the right to reject any and all bids.

Plans and specifications may be obtained upon the deposit of $10.00 (which sum will be returned upon the re-delivery of plans and specifications in good condition) by applying to the above company or to O. V. P. Stout, Engineer, Lincoln, Neb.

THE COSTILLA STATES DEVELOPMENT CO.,
By FRANKLIN E. BROOKS,
President.

O. V. P. STOUT, Engineer.

STREET PAVING.

Kirksville, Mo.

Bids will be received until Monday, February 7, 1910, for 6,000 sq. yds. of brick paving on 5 inches of concrete base. Also for 4,500 lin. ft. of concrete curb and gutter.

J. C. CAROTHERS,
City Clerk.

ARTESIAN WELL.

State Engineer's Office,
Denver, Colo.

Sealed proposals will be received at this office until noon, Saturday, February 26, 1910, for the sinking of an artesian well near Haswell, in Kiowa County, Colo.

All proposals must be accompanied by a certified check for the sum of two hundred and fifty dollars ($250.00).

For further information, forms for proposal, plans and specifications, apply to this office or to the County Clerk at Eads, Kiowa County, Colo.

CHARLES W. COMSTOCK,
State Engineer.

PAVING.

Norfolk, Va., Jan. 10. 1910.

Sealed proposals will be received by the Board of Control at its office in the City of Norfolk Va., until 12 o'clock noon on the 8th day of February, 1910, for regulating and repaving with some smooth material, parts of Granby and Chapel Streets in the said city.

Bids must be made for each street separately.

Specifications with all other information may be obtained on application to the City Engineer, Norfolk, Va.

Certified checks for ten per cent of the amount bid must accompany each separate proposal, under the conditions set forth in "Instructions to Bidders."

The right to reject any or all bids is reserved by the Board of Control.

THE BOARD OF CONTROL.
Norfolk, Va.

W. T. BROOKE,
City Engineer.

ARTESIAN WELL.

State Engineer's Office,
Denver, Colo.

Sealed proposals will be received at this office until noon, February 26, 1910, for the sinking of an artesian well at or near Cortez, Montezuma County, Colo.

All proposals must be accompanied by a cashier's check for the sum of two hundred dollars ($200.00).

For further information, forms for proposal, plans and specifications, apply to this office or to the County Clerk at Cortez, Montezuma County, Colo.

CHARLES W. COMSTOCK,
State Engineer.

CEMENT BRIDGES AND CULVERTS.

Montezuma, Iowa.

The Board of Supervisors of Poweshiek County, Iowa, will meet at their room in the Court House at Montezuma, Iowa, Feb. 23, 1910, to let the contract for building cement bridges and culverts in Poweshiek County for the year 1910.

The Board wishes those interested in that kind of work to meet with them on that date.

J. W. ROSE,
County Auditor.

U. S. ENGINEER OFFICE.—Chicago, Ill., Jan. 20, 1910. Sealed proposals for dredging and rock excavation in Chicago River, Ill., will be received here until 10 a. m., Feb. 23, 1910, and then publicly opened. Information on application. THOS. H. REES, Major, Engineers.

Proposal Advertisements Continued on Page 52.)

THE FIRST BOOK EVER PUBLISHED

On the Subject of "Cost Keeping and Management Engineering"

By HALBERT P. GILLETTE and RICHARD T. DANA

The Authors are pioneers in the field; and, although they have written much that has appeared in the form of articles—particularly in the pages of Engineering-Contracting—this book is the first presentation on the subject in a complete and logical sequence.

In this age of keen competition it is very essential that the business of contracting be conducted upon a systematic basis. This can be accomplished only by keeping a tabulated detail record of each job. You cannot afford to be without the **only** book published that gives these methods.

You Should Keep an Accurate Cost of Your Work and Understand How to Handle Men Economically

The Following Chapters Indicate the True Value of This Book

CHAPTER I—The Ten Laws of Management.

CHAPTER II—Rules for Securing Minimum Cost.

CHAPTER III—Piece Rate.

CHAPTER IV—Bonus and other Systems of Payment.

CHAPTER V—Measuring the Output of Workmen.

CHAPTER VI—Cost Keeping.

CHAPTER VII—Office Appliances and Methods.

CHAPTER VIII—Bookkeeping for Small Contractors.

CHAPTER IX—Miscellaneous Cost Report Blanks and Systems of Cost Keeping.

Cloth, 6x9 inches, 360 pages, 184 figures.
Price $3.50, net postpaid.

This Book and one Domestic Subscription to Engineering-Contracting for One Year $5.00

$350,000 Spent; $228,000 Wasted.

To waste $228,000 out of an expenditure of $350,000 is something of a record even for politician department heads employing day labor. According to the report of B. F. Welton, civil engineer, who has investigated the workings of the Chicago Bureau of Sewers for the Merriam commission, appointed to search into that city's financial affairs, "a most conservative estimate of the existing pay roll waste would not be less than 65 per cent of the labor pay roll expenditures. The records of the Bureau of Sewers show that over $350,000 was expended for the year ending Dec. 1, 1909; 65 per cent of the amount is approximately $228,000, which represents the annual waste in 1909." This waste is charged wholly to inefficiency of the working force, lack of experience of labor and plain loafing on the job, and a wealth of detailed evidence is presented to substantiate the charge. In commenting three weeks ago on the appointment of engineers as department heads by Mayor Gaynor of New York city, we called attention to the disclosures of incompetency among politician heads of departments made by the Boston Finance Commission and prophesied that when the findings of the Merriam commission now working in Chicago were made known, an even more astounding state of affairs would be indicated. Since that writing the Merriam commission has made public two reports of its findings. One report shows the unwarranted, if not fraudulent, payment of $46,000 to a contractor for public work for rock excavation where no rock existed and demonstrates this payment to have been the result of the gross incompetence if not of the actual connivance of the city heads of departments. The other report is the one which we have quoted above. Of the two reports it indicates a condition of affairs which is the more serious. Straightforward steals or mishandling of public funds in large single amounts are easily discovered and readily made plain to public censure, but the cumulative waste resulting from the day labor system of doing public work under lazy and incompetent managers is too insidious for general notice although ten-fold more damaging. We have been accused of harping too much on this string. Is there not warrant enough for it in such disclosures of the inefficiency of the city day labor system as this of the Merriam commission?

How to Increase the Efficiency of the Civil Service.

The civil service is a term borrowed from England and originally meant the civil branch of the government as distinct from the military. Corruption and inefficiency marked the conduct of affairs because positions in the Civil Service were considered a proper reward for political services. About the middle of the last century Civil Service Reform was a vital issue in Great Britain and after many years of strenuous work on the part of reformers, examinations to prove fitness were substituted for party fealty as a test before appointment and permanency in tenure of office was assured. Shortly after the reform was accomplished the movement spread to the military services; purchase of appointments was abolished, the system of purchase and sale of commissions stopped by a financial settlement with officers holding commissions; cramming schools conducted by half-pay officers disappeared and cadet schools were established, to which appointments were made regardless of rank or station in life. To accommodate however young men of means, commissions can be secured in high-class regiments after a certain number of years' service in a yeomanry or militia command without going through a cadet school. The principle however was fixed of putting in the public service, civil or military, men who after due examination showed their fitness to perform the duties connected with the position, in a competitive examination.

In 1816 the United States established tests for admission to West Point and only graduates of that school, or men as well prepared, were given commissions in the army. About 20 years later similar methods were adopted by which to obtain officers for the navy but it was not until 30 years after the reform of the Civil Service establishment in Great Britain that Civil Service Reform became a live issue in the United States. The adoption of the principle of a preliminary test of fitness has so improved matters that no good citizen would willingly return to the old political regime. Civil Service Reform really was a reform but in the practical administration of the system some grave defects have shown up so that to the average man the words "Civil Service" stand merely for a man appointed to a position who has conformed to certain rules and who has passed a more or less practical examination in a technically legal way. A great many appointees cram for an examination, impelled thereto by the bait of a "life job" held before their view. The uninformed claim the examinations are foolish and theoretical, such stories being generally started by those who fail to pass.

ENGINEERING-CONTRACTING stands firmly for the principle of demanding that all men be competent who hold public office; the principle upon which our government is supposed to be organized. There are defects however in our present civil service establishment and the friends of the principle of competency must permit honest criticism or be prepared to some day find that blind adherence to the rules and regulations will produce an organization of marked costliness and inefficiency. There must then be more Civil Service Reform.

The question of the sufficiency of examinations is of no moment. At first there was a tendency to move along lines of least resistance with examinations of too general a character in which the personal element was eliminated. Today much greater care is exercised and oral examinations are not uncommon as a supplement to written examinations. The question of examinations is one that is being rapidly settled and each examination is more practical than any of those preceding it. The method of appointment is generally conceded to be one of the bad features of the present system. At present the head of a department has a choice of the three men whose examination marks are highest. It is well known that the best man for a position is not always the one who passes the best examination. It frequently happens that the very best man for a particular position stands at the foot of the list of those who pass. The examination being one to determine fitness it

Copyright 1910, by the Myron C. Clark Publishing Co. All rights of republication reserved.

is to be presumed that all who pass are fit. This being so why should not the head of a department be allowed a choice from all the men certified by the examiners? He will certainly select a man of whom he has personal knowledge and when he is satisfied is fit, examination or no examination.

Such proposals have been made before and the objection made that politics will enter in. This does not seem to be good reasoning; no political test is applied at the examination. The examinations are open to all comers so it is hard to see how politics can enter. We must always remember as a starting point that this selective proceeding is not a method but is a principle; the principle of fitness. Extreme advocates are too prone to forget the underlying principle and make a fetich of regularity and red tape, the two things that are at present hurting the civil service organization.

An examination is announced and a number of men proceed to cram for it. The prize goes to the best crammer and he is appointed to a life position simply as a result of a few strenuous hours of preparation, perhaps the last real strenuous work he does in connection with the position. This is no fancy picture and everyone who has had to do with some offices filled with men selected by civil service examinations knows this to be true. There are some splendid men serving our cities and the general government as civil service employes but it is common knowledge that many thousands are lazy and a drag on the industrious ones. Many departments are heavily over-manned because of this fact. It is also well known that many are really incompetent but not to a degree that will warrant charges being preferred against them for this reason.

Should not heads of departments have the right to discharge employes without going through present formalities? At present it is generally necessary to file charges and the accused is furnished a copy, being permitted to employ counsel to defend him at a hearing before the Civil Service Commissioners. If his defense is so good that he is returned to work the effect upon the morale of the department is bad. There is an efficiency record kept but it is a perfunctory thing as a poor efficiency record causes annoyance and an inquiry which may not sustain the keeper of the record. To permit the head of a department to discharge men brings up of course the bogey of "Politics." Could this not be effectually settled by remembering that new appointments can be made only from the eligible list?

To cause as little trouble as possible and secure highest efficiency why should not all original appointments be for one year only? Each month an efficiency card for each employe could be sent to the Civil Service Board and this board could send a copy to the employe. Failure to maintain a certain per cent would result in dismissal and of course would count against the employee in future examinations. A higher per cent of efficiency would give the department head a choice of selecting some one else for the position, the employe who failed to give entire satisfaction being returned to the eligible list with the privilege of another trial by some one else. It sometimes happens that a man may be first-class under one employer and second-class under another. An employe who serves the first year with proper efficiency grading might then be appointed to his job for five years, subject always to automatic self-dismissal because of lack of efficiency. Upon the completion of this five years' service satisfactorily he could be appointed for life, thereafter to be removed only upon charges as is the present custom. No man could then be head of a department until he had served this six years probationary term except that during the first ten years of civil service regulations in a city this requirement could be waived. Five or more years' service in a similar capacity in another city operating in the same way could be counted in case it is found advisable to bring in an outside man.

Pensions could be provided with compulsory retirement at the age of 70 years, or sooner, for disability. Five per cent of salaries could be placed in the pension fund and if an employe resigns he would be entitled upon reaching the age of 70 to the pension his years of service entitle him to, or his money be returned to him with interest at the rate of four per cent and he will thereafter have no claim for a pension. The amount of pension could be governed by length of continuous service.

To summarize, do not the present faults of the civil service organization lie in the lack of a probationary period of service to supplement the first examination to determine fitness; the deadening effect on ambition of a life job secured through a cram examination; the lack of control over subordinates; and, the lack of pension provisions so new blood can be introduced and old men and women removed when their efficiency begins to lessen? We should be glad to hear the opinions of our readers on these questions.

The Twenty-Fifth Annual Meeting of the Illinois Society of Engineers and Surveyors at Cairo, Ill.

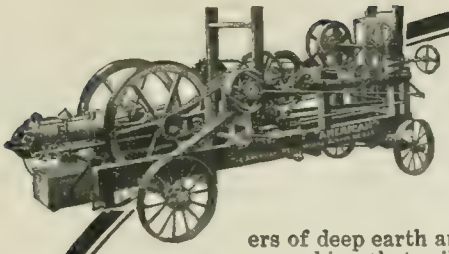
The program of papers read at the Cairo meeting of the Illinois Society of Engineers and Surveyors, published in ENGINEERING-CONTRACTING, issue of January 19th, was substantially adhered to. The convention was called to order on the afternoon of Jan. 26, and from 2 p. m. of that day until the adjournment at 9 p. m. of Jan. 28 there was a struggle between the men who believed their duty required them to listen to papers, and the citizens of Cairo who made the city free to the delegates and saw no reason for the reading of papers. The citizens finally won and a banquet followed the last session.

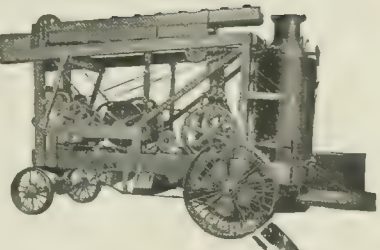
There was a very large attendance from all parts of the state and the papers presented were of a high order. Those of general interest will appear in early issues of ENGINEERING-CONTRACTING and all will be printed in the 1910 Proceedings of the Society. The officers elected for the ensuing year are as follows: President, A. N. Johnson, State Highway Engineer of Illinois; Vice President, J. W. Dappert of Taylorville, Ill. Mr. Johnson being a Trustee his election as President left a vacancy, which was filled by electing Mr. J. G. Gableman as Trustee for 1910. For Trustees to serve 2 years the society elected Mr. Geo. C. Habermeyer and Mr. A. B. Alexander. The choice of a majority for the next place to meet in 1911 was East St. Louis.

At such a convention interest is naturally divided between the papers, with attendant discussion, and the social features. It is the one opportunity many have of meeting with men working along similar lines and the interchange of experiences. Sometimes experience meetings on excursions are far richer than the more formal ones in the convention hall. Mayor Parsons of Cairo held this idea strongly and he was energetically backed by the citizens. On the afternoon of the 27th a special train took the members on a trip to the Illinois Central R. R. bridge at Cairo and to the famous Thebes Bridge. At Thebes nearly all the delegates visited the old Court House where Abraham Lincoln and other noted lawyers of his day conducted cases. In the evening Mr. M. O. Eldredge of the U. S. Bureau of Road Inquiry gave a most interesting talk on roads, illustrated by lantern slides, and Mr. F. O. Dufour, Professor of Bridge Engineering at the University of Illinois, gave an illustrated talk on interesting bridges in Europe. Following these talks a smoker at the Alexander Club was tendered the delegates by the Cairo Commercial Club and the Board of Trade. A bountiful collation was served, followed by songs by the Cairo Maennerchor and speeches by good speakers. The delegate's badge insured free rides on the street cars. On the afternoon of the 28th the Mayor personally conducted a steamboat excursion on the river to give the delegates an opportunity to see the junction of the Mississippi and Ohio Rivers. At noon on the same day one of the moving picture theatres was given to the convention and Mr. Eldredge presented moving pictures showing all the operations of road building and also moving pictures of rock quarrying in France and the blasting of 150,000 tons of rock in one shot, in that country. Until the recent blast whereby 180,000 yards were removed in Southern California this French blast was held to be the record.

In the evening after the excellent paper by Mr. J. W. Woermann on the "St. Louis and Cairo Deep Waterway," Professor Dufour finished his illustrated talk on "Observations of Engineering in Europe" and Mr. Johnson (President-elect) gave a talk on "Developments in Road Construction." an illustrated paper on reinforced concrete bridge construction in Illinois. The meeting then adjourned to the banquet at the Halliday Hotel, tendered by the citizens of Cairo.

On the last afternoon upon the return from the boat trip the delegates held an experience meeting of several hours to discuss topical questions suggested by members and printed on the program. This informal meeting was one of the most enjoyable features of the convention and was participated in very generally by delegates. The report of the committee on registration and licensing of surveyors brought up considerable discussion. The committee was continued, although not hopeful of success in securing a license law for surveyors as the members of the State Legislature were opposed to it, and it did not have the support of all engineers. Mr. Chamberlain, as a railroad engineer, based his objection to the proposed law on the ground that under it every man who made a land survey must have a license. He believed this was a hardship and that it should be sufficient to permit a licensed surveyor to employ unlicensed instrument men provided he was held personally responsible for the work of his assistants. It was shown that this was not the intention of the law and only the poor English employed would warrant the reader in so construing it. The report of the committee on surveying advocated the necessity of having monuments established on which to base town and city resurveys and after some discussion a Committee on Publicity was added to the special committees, the members to be appointed by the President. This committee is to give publicity to those parts of the proceedings that affect most largely the engineer in his relations with the public. The committee on the metric system presented an interesting report on the history, advantages and present disadvantages of this system of weights and measures. The paper and the discussion following it indicated that the society does not believe it advisable at the present time to advise legislation on this subject but believes the whole world will ultimately adopt a uniform system of weights and measures, the process being evolutionary rather than revolutionary. The committee on measures of length reported against the project of having standards fixed at county seats for the reason that for a small fee the Bureau of Standards in Washington will test tapes.





For Every Condition We Have A Drill

59 regular styles and sizes and the 40 year's experience of the world's largest makers of deep earth and rock drilling machinery enable us to furnish a machine that will solve every deep well and mineral prospecting problem more economically than any other method.

"American" Drilling Machines

fulfill every condition of deep drilling because we do not recommend one machine for every purpose but for every kind of earth and rock drilling we have an independent type of drill especially designed to meet the requirements.

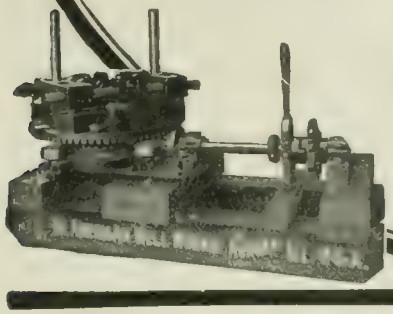
The deepest wells in the world were put down by our machines.

Practically all of the oil wells in the Beaumont, Texas field were sunk by our machines—many of them at the rate of 1,000 feet a day—after a half a dozen other makes of machines had been thoroly tried and did not succeed in putting down a single well in the caving quicksands encountered in that locality.

Our Coring Machines operating in conjunction with our Adamantine Process will remove a core of any size, any depth, thru any shale, coal or rock formation at half the initial cost of the machine and half of the expense for maintenance of a Diamond Drill.

It is unaffected by crevices and tilting strata—the drill-hole is always perfectly plumb.

For any kind of ore, metal or coal prospecting, drilling for hydraulic plunger elevators or sinking caissons for bridge and building foundations—to be filled with concrete—this is the most economical machine in existence.



Our new, free, 196 page, 8x11 inch Catalog —the most Complete "Drill-hole" Catalog ever issued—is now ready for Distribution.

REFUSE INCINERATOR, STEEL STACK AND SEWAGE PUMPING STATION EQUIPMENT.

El Paso, Texas, January 1, 1910.

Sealed proposals for furnishing all labor and materials for the construction and erection of a refuse incinerator, steel stack and sewage pumping station equipment, with appurtenances, in the city of El Paso, Texas, will be received by the City Clerk at his office at the City Hall, El Paso, Texas, until 12 o'clock noon, standard time, Thursday, March 3, 1910, in accordance with the plans and specifications on file at the office of the City Engineer of the city of El Paso, Texas, from whom copies may be obtained on payment of $10. Plans and specifications may also be seen at the office of Hering & Fuller, Consulting Engineers, 170 Broadway, New York, N. Y.

The equipment to be installed consists of one three grate top charged incinerator of a capacity of 48 tons of wet weather refuse per 24 hours, two horizontal 125 horse power water tube boilers, two direct connected engine driven direct current 65 K. W. generating sets, three direct connected motor driven vertical centrifugal pumping units each of a capacity of 2 million gallons per 24 hours, one one-ton three-motor electric traveling crane, one self supporting steel stack 4 feet 6 inches in internal diameter and 70 feet high above the base, a four ton platform wagon scale, a ventilating apparatus, a pre-heater for the incinerator, together with the necessary refuse boxes, flues, tools, instruments, valves, pipes, wires and other appurtenances.

Proposals shall be made on the blank forms to be obtained from the City Engineer, and shall be sealed and filed with City Clerk before the hour above stated, when they will be opened by him and publicly read in the Council Chamber in the City Hall.

All proposals will be considered informal and rejected which contain bids not asked for, or which do not contain prices in words and figures for all items given in the Form of Proposal, or which otherwise are not in conformity with this notice.

Each proposal shall contain the full name of every person, firm or corporation interested in the same and the address of the person, firm or corporation and secretary of the corporation bidding, and shall be accompanied by a certified check upon a national bank drawn to the Treasurer of the city of El Paso in the sum of Five Thousand ($5,000) Dollars.

The bidder to whom the contract may be awarded shall attend at the office of the City Clerk with the sureties offered by him (or them) within 12 days (Sundays excepted) after the date of the notification by the city of the acceptance of his or their proposal and there sign the contract in triplicate for the work. In case of the failure so to do he or they will be considered as having abandoned the same and the certified check accompanying his proposal shall be forfeited to the city.

The checks of all unsuccessful bidders will be returned upon demand and also the check of the successful bidder upon the execution of the contract and the furnishing of the required bond.

A bond in the sum of twenty-five (25) per cent of the amount of the contract with sureties satisfactory to the City Council will be required for the faithful performance of the work.

The refuse to be burned will be a mixture of vegetable and animal matter, bones, paper, rubbish, cans, bottles, ash, dust, floor sweepings, manure, dead animal and street sweepings, as these constituents are defined in Article II of the contract.

No tests have been made to ascertain the calorific value of the refuse. The bidder must make for himself such investigations as he may deem necessary and after he has made his proposal to the city of El Paso he shall not make any claims or complaints as to the character of the refuse because of any failure on his part to properly fulfill the specifications and required guarantees. It may be stated, however, that at the present time refuse is commonly burned on the dump or in piles in the back yards of the houses. On account of the dry climate, evaporation of water from the refuse is rapid.

Each bidder shall furnish all of the drawings, specifications and statements called for under this contract and they shall accompany and form a part of his proposal to the city of El Paso.

All bids will be compared on the basis of the Engineer's estimate of the work to be done as outlined in the five items given below:

Item.

I. Furnace, combustion chamber, preheater, refuse boxes, tools, flues, instruments, duplicate materials and tests. Lump sum.

II. Generators, motors, pumps, valves, piping, ventilating apparatus and tests. Lump sum.

III. Electric crane, platform scales, float gage and tests. Lump sum.

IV. Boilers, feed pumps, feed water heater and steam piping. Lump sum.

V. Self supporting steel stack and foundations. Lump sum.

The quantities in these items are not given in detail and are only to serve as the basis of a uniform comparison of bids. The City Council reserves the right to increase or decrease the amount of any class or portion of the work as may be deemed necessary and according to the specifications and contract.

The City Council reserves the right to reject any or all bids.

PERCY M'GEE,
City Clerk.

F. H. Todd,
City Engineer.

CONSTRUCTION OF REFUSE INCINERATING AND SEWAGE PUMPING STATION, FORCE-MAIN AND SEWAGE DISPOSAL WORKS.

El Paso, Tex., January 1, 1910.

Sealed proposals for furnishing all labor and materials for the construction of a refuse incinerating and sewage pumping station, force-main and sewage disposal works, with appurtenances, but not including furnaces, pumps and machinery, in the city of El Paso, Texas, will be received by City Clerk of said city at his office at the City Hall, El Paso, Texas, until 12 o'clock noon, standard time, March 3, 1910, in accordance with the plans and specifications on file at the office of the City Engineer of the city of El Paso, Texas, from whom copies may be obtained on payment of $10. Plans and specifications may also be seen at the office of Hering & Fuller, Consulting Engineers, 170 Broadway, New York, N. Y.

Proposals shall be made on the blank form to be obtained from the City Engineer, and shall be sealed and filed with the City Clerk before the hour above stated, when they will be by him opened and publicly read in the Council Chamber in said City Hall.

All proposals will be considered informal and rejected which contain bids not asked for, or which do not contain prices in words and figures for all items given in the Form for Bids, or which otherwise are not in conformity with this notice.

Each proposal shall contain the full name of every person, firm or corporation interested in the same and the address of the person, firm or corporation and secretary of the corporation bidding, and shall be accompanied by a certified check upon a national bank drawn to the Treasurer of the city of El Paso in the sum of Five Thousand ($5,000) Dollars.

The bidder to whom the contract may be awarded shall attend at the office of the City Clerk with the sureties offered by him (or them) within twelve days (Sundays excepted) after the date of the notification by the city of the acceptance of his or their proposal and there sign the contract in triplicate for the work. In case of the failure so to do he or they will be considered as having abandoned the same, and the certified check accompanying his proposal shall be forfeited to the city.

The checks of all unsuccessful bidders will be returned upon demand and also the check of the successful bidder upon the execution of the contract and the furnishing of the required bond.

A bond in the sum of twenty-five (25) per cent of the amount of the contract with sureties satisfactory to the City Council will be required for the faithful performance of the work.

All bids will be compared on the basis of the Engineer's estimate of work to be done, as follows:

Item.

1. Earth excavation at site of incinerating and pumping station.2,770 cu. yds.
2. Earth excavation for force-main and disposal works.....5,800 cu. yds.
3. Rolled embankment.....6,700 cu. yds.
4. Rock excavation.....50 cu. yds.
5. Seeding.....1 acre
6. Roadways and walkways.....
7. 24-inch force-main and main distributor exclusive of trench...2,850 lin. ft.
8. 30-inch cement pipe exclusive of trench.....120 lin. ft.
9. 24-inch cement pipe exclusive of trench.....395 lin. ft.
10. 18-inch cement pipe exclusive of trench..... 45 lin. ft.
11. 14-inch cement pipe exclusive of trench.....250 lin. ft.
12. 12-inch cement pipe exclusive of trench..... 44 lin. ft.
13. 8-inch cement pipe exclusive of trench.....640 lin. ft.
14. 4-inch cement pipe exclusive of trench..... 10 lin. ft.
15. Gate valves and shear valves..... .....lump sum.
16. Concrete—1:2½:5—in sprinkling filter (except slabs), settling basin, manholes, foundations to laboratory and other concrete of similar nature required.....1,425 cu. yds.
17. Concrete—1:2:4—in foundations, walls, columns and floors in the incinerator and pumping station building below the top of the incinerator floor..... .....625 cu. yds.
18. Concrete—1:2:4—in sedimentation tank and concrete slabs over the main and lateral collectors of filter..... .....202 cu. yds.
19. Steel reinforcement....41,450 pounds
20. Lateral distributors.....lump sum.
21. Risers.....lump sum.
22. Nozzles.....lump sum.
23. Dosing Apparatus.....lump sum.
24. Miscellaneous wrought iron and steel work.....10,000 pounds
25. Miscellaneous cast iron work..... .....3,000 pounds.
26. Wooden appurtenances.1.2 M. ft. B. M.
27. Laboratory.....lump sum.
28. Superstructure of incinerating and pumping station.....lump sum.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Method and Cost of Reinforced Concrete Highway Bridge Construction Under the Direction of the Illinois Highway Commission.*

This paper presents some cost data of highway concrete bridges built in 1909 under the specifications and supervision of the Illinois Highway Commission.

It is well to explain first just what control the State Highway Commission in Illinois has over bridge work. Under the law creating the commission it can upon request of local officials give advice concerning roads and bridges. The work therefore is purely advisory and can be undertaken only at the invitation of the local officials, who may or may not accept the advice offered, as they see fit.

The inspection, plans, estimates, specifications, and supervision given to the work by the state commission where requested by the local officials is all done without charge to the township or local community. The fact that in the past they have built so many poor bridges at a price oftentimes too great has induced many of the township officials, as well as county boards, to seek the aid of the commission in designing and erecting bridges, and the more this work has become known over the state the greater has been the demand, until at present 502 bridges have been inspected and reported upon, complete plans for 383 made, and 202 bridges completed or under contract, of which 137 are of reinforced concrete.

Probably a majority of the bridge sites in Illinois has a low clearance or headroom. Foundations usually must rest on earth; in many instances it becomes necessary to drive piles in order to give sufficient bearing. It is exceptional that the rock approaches near enough to the surface to found the abutments on it. It became necessary to adopt such a design as would give maximum clearance and waterway, at the same time adapted to an earth foundation. We therefore developed a through girder concrete bridge—that is, a bridge supported by two girders to which the floor is hung—in this way using a minimum of clearance and giving a maximum waterway for a given distance between abutments.

This type of bridge has its limitations. A bridge supported by two girders to which the floor is hung is limited as to width of roadway for a given span and also as to length of span. It is found, however, that where the roadway is not required to be over 18 or 20 ft. this type of bridge has proved economical up to spans of 40 to 60 ft., as compared with arches having the same area of waterway and designed to carry the same loads. While the tops of the girder bridges are heavier than would be required for arches, yet owing to the fact that there is no horizontal thrust developed, the abutments do not need to be as extended or made as heavy. There is therefore less concrete for the width of roadways named, taking the abutments and superstructure as a whole, in the through girder design than for arches, giving the same area of waterway and capable of supporting the same loads. In appearance the girder bridges are massive and well adapted to their apparent purpose, having in general a not unpleasing outline.

Perhaps the greatest advantage possessed by the girder type over the arch is the slight damage, if any at all occurs, to the former due to uneven settlement of the abutments, as is very apt to occur in many of the soil conditions encountered, while on the other hand such displacement of the abutments of an arch is extremely hazardous to its stability. These are the reasons that we have designed nearly all our concrete bridges of the through girder type, not that this type is necessarily to be preferred in all locations or under all conditions, but merely that it has proven most economical in nearly all instances in our practice.

Method of Design.—The formulas used in the design of these bridges have been deduced from the general formulas developed by Prof. A. N. Talbot and others. The form in which we use them is that most convenient for purposes of bridge design. The first fact to determine is the stress to be allowed in the concrete and the steel, which, when once fixed, determines the percentage of steel reinforcement. The compression allowed in the concrete has been taken at 750 lbs. per sq. in. for concrete 60 days old with a corresponding stress in the steel in tension of 16,000 lbs. per sq. in. This corresponds to practically 1 per cent reinforcement.

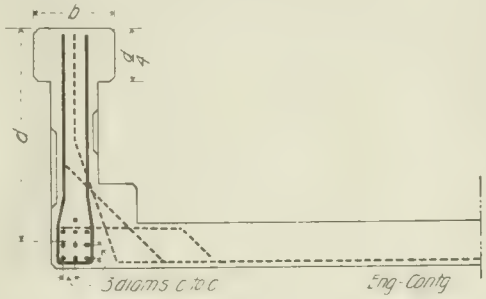

Fig. 1—Half Transverse Section of Standard Girder Highway Bridge, Illinois Highway Commission.

To compute the dimensions of a girder to withstand a given bending moment, M, where b is the breadth and d the depth, from the top of the beam to the center of gravity of the steel, using the above stresses in the concrete and steel, we will have $M=0.853\times16.000\ bd^2\times0.01$. As we usually assume b and desire d, this reduces to the simple form:

$$d=\sqrt{\frac{M}{136b}}$$

For computing the depth of T beams, see Fig. 1; the width of the flange b is assumed, and the depth is then computed by the above formula, but always making the depth of the flange not less than one-fourth of the value found for d.

To provide against diagonal tension in the webs of beams, U stirrups are used where the shear in the concrete exceeds 30 lbs. per sq. in. The amount of steel to be provided is found thus: Let V be the total shear in a given section of the beam. The steel, stressed at 16,000 lbs. per sq. in., necessary to carry 0.6 V is distributed along the beam for a distance equal to the height of the beam $= d$. For example, if $V = 200,000$ lbs., 0.6 $V = 120,000$ lbs., which would require 12.5 sq. ins. of steel. If the value d of the beam is 60 ins., there is required 12.5 sq. ins. of steel for 60 ins., or 0.208 sq. ins. of steel per inch of girder. A U-shape stirrup of ¾-in. square section rods would have in both legs 1.12 sq. ins. of steel, which divided by 0.208 will give the spacing for the U stirrups, which in this case would be about 5 ins. for the first 60 ins. along the beam. In the next section a new value for the shear would be computed and the rods and stirrups spaced accordingly, as we usually compute the shear for sections which are arbitrarily spaced along the beam equal to its depth d.

The thickness of the web of the T beams should be investigated for horizontal shear. Usually, however, the governing factor in determining the thickness of the web is the space required for the reinforcing rods.

The loads for all concrete bridges are taken thus: Dead loads concrete at 144 lbs. per cu. ft., crushed stone at 90 lbs., and earth at 100 lbs. per cu. ft. Live loads are uniform 125 lbs. per sq. ft. and concentrated live load of 24 tons distributed on two axles 10 ft. apart, 8 tons on the front and 16 on the rear axle. The load is taken as applied over a width of 12 ft. The moment for both uniform and concentrated live loads is computed, and the greater combined with the dead load moment to determine the girder and floor dimensions.

Character of Concrete.—The character of concrete employed in the bridges under discussion is a factor governing the cost. The specifications provide for a 1:2½:4 mixture for reinforced work. This proportion was determined upon after considerable experience with a 1:2½:5 mixture, which did not secure an altogether satisfactory finish. As much of the surface of the concrete is exposed in bridges, a smooth, close grained surface is particularly desirable. If a smooth finish is to be secured in concrete work, it is necessary first that the forms be carefully made and kept true to alignment; second, that the concrete shall contain sufficient mortar to more than fill all voids in the aggregate. This is not secured satisfactorily when the proportion of mortar to the aggregate is one-half, as is the case in a 1:2:4, 1:2½:5, or 1:3:6 concrete. The specifications were therefore changed so that the proportion of mortar to the aggregate varies with different classes of concrete, according to the purpose for which it is to be used. In reinforced work we have endeavored to use a concrete which will have a volume of mortar about equal to 60 per cent of the volume of the aggregate. Such an amount of mortar is not necessary where the concrete is placed in large masses, but in most reinforced work the concrete must be placed around the reinforcing rods and molded closely against the forms, which are not a great distance apart. Under these conditions, if a honey-combed effect is to be avoided with the workmanship ordinarily secured, concrete with more than 50 per cent mortar should be used. In gravel concrete the amount of cement to be used is proportioned according to the amount of sand; the amount of aggregate that may then be allowed depends upon the voids in the aggregate, mortar being supplied to at least 60 per cent of the voids for use in reinforced work. Aggregate for this class of construction moreover should not exceed 1 in. in size if it is to be satisfactorily placed about the reinforcement.

While the specifications do not call for any particular kind of reinforcement, other than it must have some means of rigid mechanical bond at frequent intervals as a matter of fact nearly all the work so far done has employed square, twisted rods.

Forms.—The specifications and drawings provide for rigid forms. Particular attention is paid to the bents supporting the structure during construction. It is evident that great care must be exercised to prevent any settlement of the girders while the concrete is hardening, when it is borne in mind that, for spans of 40 to 60 ft., the girders and floor weigh 6 to 7 tons per running foot. The plans for the longer spans require that the bents supporting the forms shall rest on piles firmly embedded, unless the stream bed is of such a character to make this unnecessary. But such a condition is the exception. In a number of instances the contractor has put in concrete footings flush with the bottom of the stream bed and placed the bents on them.

Costs.—The cost data here given, Table I, were collected by the resident inspectors in the employ of the State Highway Commission. They kept a daily record of all labor for each

*Rearranged from a paper by A. N. Johnson, State Highway Engineer, Springfield, Ill., read at the annual convention of the Illinois Society of Engineers and Surveyors, Cairo, Ill., Jan. 26-28, 1910.

portion of the work, together with the quantity and cost of all materials. The cost of materials was generally obtained from the bills, and the prices secured from the contractors. The amounts given therefore do not contain any allowance for the office maintenance of a contractor's organization, no traveling expenses of the contractor, nor any allowance for profit. Also, in the cost for forms, deduction has been made for the actual salvage on all lumber, but as most of the work was in the country there was little opportunity for the contractor to dispose of this material to advantage.

All the data presented are from work done during 1909. There were a number of other jobs handled, but sufficient data were not collected on them to embody in this table. The various bridges have been arranged in order of length of span, and all data available collected together in tabular form.

In a number of instances it proved that the actual cost to the contractor was greater than his contract price. It is perhaps well to consider what were some of the causes that produced such results. First, I should ascribe incompetency on the part of the foreman as the most usual cause of loss to the contractor, or, if not an actual loss, at least a great reduction in the profit reasonably to be expected. The loss usually occurred in the foundation portion of the work. Sufficient protection would not be taken to prevent a cave-in, with the result that a large amount of extra material would be shoveled from the bottom of the trench to the top. Good sheeting well braced is usually required.

In a few instances increased cost to the contractor was occasioned by doing part of the work twice, owing to the use at first of poor materials which had to be replaced. In some instances foremen were found who could scarcely read the plans and except for the assistance of the inspector, would have had a sorry time of it. Others had no control over their men, who loafed or worked much as they pleased.

It is evident that under such conditions no profits could be expected. Probably all the contractors intended to send competent men, and possibly sent as good as they could get, but when good men are scarce it is not to be expected that they will be attracted by a poor salary. An adequate wage will usually secure competent foremen.

Money was also lost on some jobs through ignorance on the part of the contractor in making his bid. In a few cases contracts were taken at prices 30 to 40 per cent below the estimate. The bids from experienced contractors at the same letting would be for a rational sum. There should be some way by which a manifestly too low bid for public bridges or other public works for that matter could be rejected as readily as too high bids. To accept a bid too low is unfair to the reasonable bidders, takes unfair advantage of the contractor making the low bid, and by putting a premium on poor work is unfair to the tax payers.

The cost data here presented should afford some guide in making bids on similar work. Owing to the great variance in conditions it is impossible to state what price should be secured for reinforced concrete bridges to insure in a given instance a reasonable profit. It will be noticed that the cost of cement in a cubic yard of concrete varied from $2.35 to $1.25; for stone, from $3.23 to $1.30; for sand, from $1.47 to 38 cts., excluding gravel concrete; for gravel, from $2.43 to 70 cts.; for forms, from $3.95 to 83 cts.; for placing steel, from $3.10 to 80 cts.; for mixing and placing concrete, $2.72 to 72 cts.; for excavation per cubic yard of concrete, $3.91 to 21 cts.; and that the total cost per cubic yard of concrete varies from $17.51 to $6.54.

From such a wide variation it becomes apparent that averages will mean but little to estimate the cost of a particular job. One of the most uncertain features of this class of work is the cost of the excavation. It would probably be a more exact method of distribution if the cost per cubic yard for the foundation were given separately from the superstructure, and charge all of the excavation against the concrete going into the foundation. This, however, was practically impossible from the data at hand, but the amount of concrete in each portion of the structure is given, which will assist in determining the proper distribution of the cost.

It generally may be said that unless materials were exceptionally near at hand and obtained consequently at much lower cost than usual, there has been little profit to the contractor in this class of work at a price much les than $10 to $12 per cu. yd. It does not follow, however, that all of the work let at a less figure has been at a loss to the contractor, or that all jobs let at a higher figure have been at a profit, as some of the work which was let at a good figure was so badly managed as to cut all the profits and cause an actual loss to the contractor. Inasmuch as the data here given include both well and badly managed work, this fact should be borne in mind in attempting to draw any too exact conclusions. But if used with judgment it is believed that these data should be of considerable help to engineers and contractors in making estimates on similar work.

Design of and Method of Constructing a Reinforced Concrete Aqueduct Lining, with Some Data on Costs.

The Illinois and Mississippi Canal has in all nine aqueduct bridges with a total length of 1,820 ft. The matter of lining for the aqueduct trunks was therefore of considerable importance. So far as the writer is aware no concrete lined aqueducts existed in 1905 or at the time these lining were built

The bridges vary in length from 140 ft. to 350 ft., but are uniformly built in spans or bays of 35 ft., making one type of lining applicable to all of the bridges. Hence the design and general method of construction were the same for all the bridges. The construction details described, however, were those used on Aqueducts Nos. 4, 5 and 6, which were under the personal supervision of the writer. Plans were originally drawn for the trunk to be built of steel I beams with a wooden lining. Under these plans the steel beams were bought in the winter of 1904, as it was expected that the contractors would have the piers ready the following summer. The wooden linings were not to be placed until near the opening of the canal. In January, 1905, Mr. L. L. Wheeler, assistant engineer in charge of the feeder and western section of the canal, designed a reinforced concrete lining to take the place of the wooden one. This design was approved and the linings built in accordance therewith.

As above stated, the bridges are 35 ft. c. to c. of piers. The clear width of channel is 40 ft. The normal depth of water is 7 ft., but the stresses were computed under a maximum loading of 7 ft. 5 ins. The steel frame work in the floor consists of nineteen 20-in., 90-lb. I beams, 34 ft. 11 ins. long and spaced 2 ft. 3 ins. c. to c. The beams rest directly on the concrete at the piers. Three 1-in. rods carrying cast iron cylindrical separators pass through the webs of the beams, giving them lateral rigidity and unification. The side frame work consists of two of the above sized I beams placed horizontally one 6 ft. above the other. They are united by web members, forming a three panel truss to support the dead load of the beams themselves and the side lining. The upper edges of the flanges of the top beam are 7 ft. above canal bottom. On this steel frame work the linings were built.

In considering the adoption of reinforced concrete linings in preference to the wooden lining, consideration was had of the fact that should the canal be unwatered at any time the wood would be exposed to drying out, checking, and warping. As a matter of fact portions of the canal have been practically unwatered three times in the two years of its operation. Another consideration leading to the adoption of concrete linings lay in the deflection of the beams. Under the maximum loading the deflection in the bo[illegible] the bottom beam of the [illegible] tion is ⅞ in. Under [illegible] ficulty of caulking the junction of the sides with the bottom is apparent. A third important consideration in the matter developed through the local conditions existing at some of the aqueducts, particularly at Nos. 4, 5 and 6, where the water in the streams crossed, at times rises several feet above the floor of the aqueducts, the maximum recorded being 5.7 ft. at Aqueduct No. 5. Should the canal be empty, the upward and inward presure thus produced would be a serious matter which wooden linings would be unfit to resist. These contingencies and stresses, not provided for in the wood design, were readily cared for in the concrete design. In addition the first cost of the concrete lining was estimated to be 20 per cent less than the wood, with a probable much greater durability.

To meet the above conditions the design was worked out as follows: The bottom was made 6 ins. thick, with ½-in. corrugated bars spaced 6-in. centers transversely and 9-in. centers longitudinally or two between each two I beams, the tops of the beams taking the place of every third rod. The tops of the I beams were imbedded 2 ins. in the concrete of the floor, thus thoroughly anchoring the lining to the steel beams. The transverse rods were laid upon the tops of the I beams and the longitudinal rods were wired to the under side of the transverse rods. The sides were made of

CONCRETE HIGHWAY BRIDGES BUILT BY THE ILLINOIS HIGHWAY COMMISSION IN 1909.

concrete 9 ins. thick, placed with the inner face 4 ins. inside of the inner edge of the beams in the side truss; ¾-in. vertical reinforcing rods were used, spaced 6-in. centers, and bent to an irregular shape so as to come inside of the beams at the top and bottom and to within 2 ins. of the outside of the concrete in the center.

The side trusses are not sufficiently anchored to the piers to resist any great amount of inward pressure, so it was necessary to transfer the horizontal thrust, from external heads of water, to the floor system and to provide for the bending moment at the junction of the sides and bottom. To accomplish these purposes and also to prevent separation of the bottom and sides due to the deflection of the beams, a triangular piece of solid concrete was built in the angle formed by the junction of side and bottom. This triangular piece extended 3 ft. onto the floor and 3 ft. up the sides. The vertical reinforcing rods in the sides were bent out into the triangular piece and the bottom transverse sides were also carried entirely across it, thus binding the sides and floor rigidly together. The bending moment, due to the inward pressure, would then be a maximum at the top of the 3-ft. triangular piece, and the 9-in. wall there is sufficiently strong to withstand the pressure due to any external head that can occur.

The binding of the floor and sides rigidly together transfers some of the water load from the sides to the floor and from the floor to the sides, thus causing them to act in a measure as beams. The floor would of course have ample rigidity, and in order to develop the strength of the side, including the triangular piece, as a beam, and also to care for the temperature stresses, thirteen ¾-in. and nine ½-in. longitudinal reinforcing rods were used. These were spaced about uniformly throughout the section, the ¾-in. rods being placed at the bottom.

The combined weight of concrete in the floor and the submerged floor beams is sufficient to counteract the upward presure due to about 2 ft. of external head, but as heads of nearly 6 ft. had been recorded, it was very necessary to provide additional safeguards. This was accomplished primarily by bolting the floor to the piers. For this purpose nine 1¼-in. anchor bolts spaced 4 ft. 6 ins. were set along the center line of each pier. These bolts extend to the bottoms of the piers and upward between the floor beams 18 ins., so that the ends of the anchors are just below the bottom of the floor lining. The anchors were capped with nuts and large cast washers. The space between and around the ends of the floor beams and anchor rods was then filled with concrete to a depth of 18 ins. and for nearly the full width of the piers, thus thoroughly anchoring the floor beams. The floor lining at the piers rested directly on this bed of concrete, which was troweled smooth and allowed to harden in every case before the floor lining was placed. Should any expansion or contraction in the floor occur, the lining is expected to slide on this surface.

As an additional precaution against upward pressure, inlet valves with small, collapsible dams at each end of the aqueduct were provided. The valves, two in number, consist of 6-in. cast iron pipe set in the anchor concrete at each abutment, their inner or upper ends being covered with flaps which are closed against internal pressure, but which will open under external pressure and allow water to fill the aqueduct to the top of the dams. The dams consist of ten angle iron brackets, triangular in shape, to the aqueduct side of which 2-in. plank are nailed by means of nailing strips bolted to the brackets. The tops of the dams are 3 ft. above the floor of the aqueduct. The brackets are anchored to the concrete of the abutments by two small cast iron pillow blocks. A rod passing through the two legs of the bracket and both pillow blocks serves as a hinge about which the bracket can rotate laterly, when the planking is removed, to a horizontal position upon the bottom; and as the concrete to which they are anchored is 6 ins. below bottom grades, the brackets, in this position, are entirely below the surface of the aqueduct floor, and hence free from contact with any passing boat. The bracket on one end of each dam will not fall completely down owing to contact with the side wall of the abutment, but falls sufficiently far to be protected by the triangular piece of concrete in the aqueduct lining. Occasion for the operation of these inlets and dams has arisen once since their completion and their operation has been satisfactory.

To protect the concrete lining against shock and injury from passing vessels, heavy timber fenders were provided running from pier to pier. These are made up of 12x12-in. and 6x12-in. timbers bolted solidly together so as to be 30 ins. from front to back and 12 ins. from top to bottom. They are anchored to the inner face of the piers by horizontal anchor bolts and set with the upper surface 2 ft. above the normal water surface, leaving an opening of 6 ins. between the bottom of the fenders and the top of the concrete lining, through which water can overflow whenever the stage reaches 7.5 ft. It might be noted in passing that during the past year portions of the lining at each aqueduct have been cut down to the 7-ft. level to afford additional precaution against abnormal stages of water which might endanger the canal embankments. The fenders with their 30-in. top make an excellent walk along each side of the aqueduct. As a further protection against boats or projecting irons from vessels a 6x12-in. wall was bolted flush with the top of the lining by bolts passing through the concrete to the flange of the top I beam of the side frame.

The proportions of the concrete for the lining were 2 parts cement, 3 parts sand and 5 parts fine crushed stone or 1 part cement to 4 parts well proportioned gravel. At Aqueducts Nos. 4, 5 and 6 gravel was used entirely. The mixture for the anchor concrete at the piers were not quite so rich. The concrete was mixed very wet and considerable care was taken with the spreading and tamping. The floor was deposited in two courses and in sections running the length of a bay and covering two or three floor beams in width. The sections joined over the center of an I beam and no section was allowed to set before its adjoining one was deposited. Concreting the floor and the sides to the top of the 3-ft. triangular piece constituted a day's work of 8 hours during the early part of the work. The remaining top portion of the sides was placed after the lower portion had set and a part of the forming removed. The yardage in these top portions was small, and owing to the limitations of forming and the moving of runways and staging, this was not an economical method of operation, besides rendering necessary a horizontal joint at the 3-ft. point on the sides. Later authority was granted to work 10 hours and by using a different method of forming, the whole lining for one bay was deposited in a day. The surface of the floor was covered with ½ in. of mortar and troweled smooth. No finishing was done on the sides other than to exercise care to secure a dense, hard face.

The matter of forming is oftimes not given sufficient consideration in laying out concrete work, frequently being left to the carpenter foreman to work out as best he can, resulting in extra work, waste of material, and delays to the concrete gang. This loss particularly happens when the forming is anyways complex and must in part be carried on simultaneously with the concreting, and also when the forms are to be used repeatedly. On this work the floor forms were very simple, consisting of a 2-in. plank placed between the I beams and supported by brackets resting on the lower flanges of the I beams. The brackets consisted simply of a horizontal piece supporting the plank and two vertical pieces extending to the I-beam flanges, with a spreader to keep the bottom ends from slipping off the flanges. To remove these forms it was only necessary to drive out the spreaders when the brackets and plank would come out without drawing a nail. The back plank for the side forms were nailed to posts fitted between the I beams of the side truss. Between the side bottom beam and the bottom side beam a plank was specially fitted and beveled and held in place by wires passing through to the inside. On the inner face of the sides it was necessary to carry up the planking as the concreting progressed. The planks were nailed to triangular brackets extending to the full height of the sides and held in place by wires and spreaders to the back forms. The tie wires were spaced so as to come in cracks between planks. Specially sied and beveled plank were used on the triangular piece at the bottom.

As soon as the sections of the floor adjacent to the sides were deposited, they were covered 3ft. in width with plank on which was laid a runway for wheeling concrete to the sides and when these were carried up to the top of the triangular pieces, the runway was elevated and widened for a shoveling platform for completing the sides. The weight of these plank, runways, and platform was sufficient to prevent the hydrostatic pressure from the sides being transmitted under the lower edge of the form and raising the floor concrete. While the carpenters were building platforms, runways, extending forms, etc., the concrete crew was engaged on the opposite side or on a section of the floor so that the concreting progressed without delay. Between bays a board ½ in. thick was placed. This was afterward cut out with a chisel and the joint poured full of pitch.

For mixing the concrete a ½ cu. yd. Smith mixer was used. The mixer was set in the ca-

nal trunk near one end of the aqueduct and charged from the embankment above by one-horse dump carts. For filling the nearest bay the concrete was usually taken direct from the mixer in wheelbarrows, but for the remaining bays a track was laid and a side dump car pushed by hand was used to convey the concrete to a shoveling platform, adjacent to the bay being filled, from which it was shoveled into wheelbarrows and wheeled to place.

An interesting feature of the work was the methods used for protection against freezing. Owing to delay in the foundation and pier work some of the lining could not be placed until late in the season and the local conditions were such that it was very urgent that the work be finished without delay. The last concrete was deposited Dec. 28 and the temperature during the final weeks dropped as low as 12° or 15° F., barely rising to the thawing point in the middle of the day. Owing to the thinness of the lining, its exposed position, and the importance of the work, considerable care was necessary. To heat the concrete materials the exhaust steam from the mixer engine was turned into the drum of the mixer. This was accomplished by conducting the exhaust pipe to a point in front of the discharging opening of the drum, so that the drum when tilted for discharging would just clear the end of the pipe. The force of the exhaust then carried the steam into the revolving drum, where complete mixture with the dropping particles of concrete utilized practically all of the heat remaining in the steam. This method of heating concrete is unique in the writer's experience and when it is considered that the expense was absolutely nothing the results were really surprising. The temperature of the deposited concrete averaged probably 70° F., while if a batch were left in the mixer 3 minutes or more its temperature would 90 to 100° F.

[One of the editors of this paper on a piece of concrete work executed in 1906-7 had a ⅛ cu. yd. Smith mixer operated by a steam engine and the exhaust steam was discharged into the drum after passing in a coil through the water barrel on days when the temperature fell below freezing. The steam was conveyed about 125 ft. from a power house in a 2-in. pipe placed in a wooden box 6 ins. square filled with plasterer's hair. The following winter, 1907-8, he had charge of another piece of work on which a Chicago improved cube concrete mixer was used, operated by an electric motor. Steam was conveyed about 200 ft. from a power house with connections so steam hose could be attached for the purpose of cleaning the surface of set concrete and warming the concrete and forms. Branches went through the sand and stone piles and in a coil through the water barrel, ending in the mixer drum. It was found advisable to have canvas flaps over the openings of the mixer drum to confine the steam, as otherwise it bothered the men working close to the mixer.—Editors.]

To protect the deposited concrete, the inside of each bay at the close of the day's work was roofed over with 1-in. boards laid loosely on "horses," the ends being closed with pieces of canvas, and into the room thus formed, live steam from the boiler was conducted through a hastily laid pipe line. The night watchman kept up the steam, the amount needed being very small. Steam was kept on the concrete for two nights or for about 40 hours after being laid. It was considered that the outside was sufficiently protected by the 2-in. forming. On the third day the forms if needed were removed and the concrete left exposed. The cost of this protection was about 12 to 15 cts. per cubic yard of concrete and the results were perfect. As an illustration of the need of protection, it may be noted that the feed pipe for the boiler froze one night about midnight and steam was shut off from the concrete for about 7 hours. The concrete froze some and about ½ in. of the surface afterwards shelled off.

The average cost of the lining for aqueducts 4 to 9 inclusive was as follows:

Cost of concrete per bay	[illegible]
Cost of reinforcement per bay	[illegible]
Total cost per bay	[illegible]
Cost of concrete per cu. yd.	[illegible]
Cost of reinforcement per lb.	[illegible]

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Design and Construction of Open Ditches to Reduce Maintenance with a Description of Methods of Maintenance and Some Costs.*

A great deal of attention has been given to the design and construction of open ditches, but comparatively little to their maintenance. In fact, in many counties of the Mississippi valley where drainage work is just commencing there seems to be quite a general idea that a ditch once properly constructed will require no maintenance. Unfortunately this is not true, and open ditches, like roads, bridges, and all other engineering structures, will need more or less attention from time to time in order to keep them up to their highest state of efficiency. The amount of repair work necessary will vary with the conditions, but will be very largely reduced by careful designing.

In establishing the grade line of a ditch the ideal to be aimed at is a uniform rate of fall from source to outlet. The gradient should be flat enough to prevent erosion, yet steep enough so that at times of maximum flow loose material which has settled into the bottom of the ditch will be washed away. This ideal gradient can very seldom be used, on account of other rigid determining conditions, but the nearer it can be approached the better.

Humps in the grade line can not be considered objectionable from a maintenance standpoint, but sags are very objectionable and should be avoided wherever possible. It is a great mistake to break up the grade line into short sections for the purpose of saving a small percentage of yardage, except in the somewhat rare case of the ditch being through soil which will not erode under the most extreme conditions, because if a stream of water containing suspended matter passes down a ditch over a sag to a flatter slope, the coarser particles will be deposited, and the ditch will give trouble at that point. For the same reason curves should be as flat as possible, in order that the velocity of the water may not be checked and deposits occur.

A ditch should not be much less than 8 ft. wide at the bottom, especially if it is to be constructed by a machine which leaves rough slopes, as nearly all types of machines do. If an 8-ft. ditch looks to be very much larger than necessary, the use of large tile should be considered. If due weight be given to the question of maintenance, as well as the damage of an open ditch to the land crossed, one or more lines of large tile will be resorted to in a great many cases where narrow bottom open ditches are now used, and this is for the reason that in a narrow bottom ditch a small amount of material deposited from suspension or from the sides will have a great deal more effect in raising the grade of the ditch and obstructing the flow of water than the same amount of material in an 8-ft. ditch.

Another reason why 2, 3 and 4 ft. ditches should not be used appears from the manner in which they are usually constructed. With most types of ditching machine the banks can not be left as smooth as can be done by hand or team work, and it is expected that more or less loose material will roll or be washed down the sides to the bottom of the ditch. Operators aim to cut the center of the ditch from 1 to 2 ft. below grade, so that when this loose material fills in, the ditch will still be below grade. In a ditch much less than 8 ft. wide, however, if he carries out the usual program, he must either steepen the slopes or make a roughly rectangular shaped cut 1 to 2 ft. deep and as wide as the bottom of the ditch, either of which is likely to cause caving of the slopes. The practical result is that it is very difficult to construct a narrow bottom ditch with the common types of machine.

The ideal slope of banks would seem to be that made by nature during the erosion of streams under similar circumstances to those of the case in hand, because in the course of years an artificial channel will, by the process of erosion and weathering, tend to become shaped by nature into the form best suited to the purpose of carrying away the water, just as in natural channels, and the nearer to this form the ditch is originally constructed, the less the amount of erosion which is likely to occur. This shape will vary under different conditions, but in sedimentary soils will usually approach that of the letter U, with the legs slightly inclined. This form gives a large hydraulic mean radius and consequent high velocity.

From these considerations it would appear that it is better to design ditches with steep rather than with flat slopes, although many engineers take the opposite view. At any rate the slope specified should be such as can be made by the type of machine to be used, nature being expected to adopt them afterwards to her ends if necessary.

Ditches with low rate of fall should be designed with a cross sectional area in excess of that required to take care of the flow, and should be put deeper into the ground than otherwise called for, lest erosion may not take care of the loose material which will be washed down from the slopes during the first year after construction.

The bermes between the edge of the spoil banks and the ditch if made unnecessarily wide, will add unduly to the cost of construction. If there is to be any danger from the banks sliding in on account of the weight of the spoil banks, it will be at its maximum at any particular point just after the spoil bank at that point is completed. After the machine once passes and the spoil banks as well as the ground commence to dry out, there is not usually much danger of the weight of the spoil banks causing slides.

Narrow bridge openings often cause more or less filling up of a ditch, due to the eddies which are formed; the minimum clear width between abutments should be no less than the width of the ditch at the elevation to which the water is expected to rise in times of maximum flood.

Concrete bridges should not be used across ditches which are likely to have to be cleaned out later on with a floating dredge unless they be of such span and height as to allow a dredge to pass under without a great amount of dismantling. Otherwise it will usually be cheaper to use steel bridges, which can be removed and replaced. But if a ditch is to be maintained in the most economical way, mentioned further on, bridges will not have to be removed, and concrete or any other type may be used.

Attention should be given to the design of outlets for the tile and open branches to the end that erosion at such points may be prevented and the flow of water in the main ditch disturbed as little as possible. Branches should form an acute angle with the main line at their junctions.

The method of construction or the means by which a ditch is constructed has a bearing on its maintenance, the amount of which is disputed and probably will vary under different circumstances. It will seldom be possible, however, to select a method with a view to reducing maintenance charges, because such a

*A paper by E. H. Cowan read before the Illinois Society of Engineers and Surveyors, annual convention of 1910, Cairo, Ill.

method will most likely exceed in first cost the usual methods by a sum which, capitalized, would amount to more than enough to maintain the ditch. It will almost always be true economy to allow the contractor to select the means to be used, and to write the specifications in such a manner as to call for the best work possible to be obtained by such means.

As stated at the beginning, in spite of the most careful designing and constructing, all ditches will need more or less repair work from time to time in order to keep them at their maximum efficiency. Economy requires that this work be done annually during the dry months of summer and fall, but how rarely is this attended to. Just as roads in a great many localities are allowed to become almost impassible before being repaired, and bridges almost to collapse before receiving any attention, so ditches are left gradually to fill up until they will no longer carry off the water. Then there is a spasm of general agitation and condemnation of all parties who had anything to do with the construction of the ditch, followed by perhaps several years of strife among otherwise friendly neighbors, and finally a dredge is installed and the ditch cleaned out and enlarged or a new drainage district is formed and a new ditch constructed at large expense which is expected to remedy the supposed defects of the original one.

Railway companies and other business organizations realize that maintenance work must be done at regular intervals on all their physical structures. Nowhere except in the case of municipalities, including counties and drainage districts, do we find the general policy pursued of a periodical reconstruction of engineering structures rather than their regular maintenance. Is it not possible to devise a system under which the physical property will be as well looked after as that of business organizations? Such a system is needed because experience has shown that reliance can seldom be placed on the initiative of public officials.

As to the methods and costs of doing such work, there is an extremely small amount of recorded experience. Mr. E. E. Watts, a civil engineer of Princeton, Ind., in a paper read in 1902 before the Indiana Engineering Society, estimated that the expense of maintaining a 10-mile ditch running 25,000 cu. yds. per mile, in operation 5 years, need not exceed $10 per mile per year. This is a very small amount compared with the benefit to be obtained from keeping the ditch always in good condition.

As to the best methods of doing such work, little of value can be said until more work has been done and more experience gained and recorded. If ditches are gone over every year, hand and team work will be likely to be principally relied on. The former is to be preferred, even in places where the cost would be considerably greater, for the reason that the dragging of scrapers up the banks harrows them up and leaves much loose material on the slopes which will be washed back in by the next rain. The writer once undertook to clean out a narrow, deep canal leading to a water works intake. Each year or two during the previous 10 years this canal had been cleaned out by teams and scrapers, but it would soon fill in again. The method the writer used involved the lifting of the scrapers out with a derrick, thus not disturbing the slopes, and the result was that the canal stood at least 6 years without any further repairs.

Annual maintenance work should consist not only of the removal of sedimentary deposits, but also of tall grass, weeds, brush, willows and floating debris, as all these obstruct the flow and are a fruitful source of silting.

As indicated above, the principal maintenance work which has heretofore been carried out consists rather of reconstruction or redredging of ditches which have been neglected. The amount of work to be done is sometimes large enough to justify the installation of some type of dredge, but often it is so small that cheaper methods are desired. Many types of machine have been suggested, but few tried out. Such work is likely to always be rather expensive per yard of material moved as compared with other classes of excavation, although not so as to the value of the work done to the lands affected.

The North River Tunnels of the Pennsylvania R. R. Tunnel Entrance to New York City.*

GENERAL PLAN OF WORK.

The final decision to extend the Pennsylvania R. R. into and through New York city by a system of tunnels, and erect a large station in that city, was not reached in a hurried or off-hand manner, but after years of painstaking study and a full and extended investigation of all routes, projects and schemes, whether originating with the company or suggested by others.

The question of tunnels under the North River was an uncertain factor in the scheme, owing to the nature of the ground composing the river bed in which the tunnels would be constructed. It is well known that about 35 years ago an attempt was made to construct a tunnel under the North River by using a "Pilot" system under compressed air and forming the tunnels in brick masonry. Owing to the very soft nature of the materials through which it passed, several serious accidents occurred, and the work was abandoned after about 2,000 ft. of tunnel had been constructed. Later, this work was taken up again, when a shield was installed and an additional 1,800 ft. was built with cast-iron segmental lining, but the work was again abandoned, owing principally to financial difficulties while coincidentally before entering a rock reef which presented another serious difficulty in construction. The experience then in the construction of this tunnel led capitalists and engineers to believe that, owing to the very soft nature of the ground, a tunnel could not be built that would be sufficiently stable to withstand the vibration due to heavy traffic, and for this reason tunnels under the North River were not looked upon as practicable. The writer devised a scheme to carry within the tunnel the rolling loads on bridging supported on piers or piles extending from the tunnel invert down to hard material. These would be attached to the tunnel itself or would pass into it independently through sliding joints in the tunnel shell. This scheme gained the confidence of the management, as it was believed that, by adopting such a plan, tunnels could be built in the soft material underlying the Hudson River and remain stable under all conditions of traffic. After thus feeling assured that by this method the tunnels could be made safe beyond question, orders were given to proceed with the great work of the extension. The work was divided into three residencies:

(1) The Terminal Station-West, under the charge of B. F. Cresson, Jr., M. Am. Soc. C. E., Resident Engineer, comprising the work from the east side of Ninth Ave. to the east side of Tenth Ave., including excavation, retaining and face walls, and the extensive work of underpinning Ninth Ave. with its surface and elevated railroads and other structures.

(2) The River Tunnels, under the charge of B. H. M. Hewett, M. Am. Soc. C. E., General Resident Engineer, and Mr. H. F. D. Burke and William Lowe Brown, M. Am. Soc. C. E., Resident Engineers, including the land tunnels from the east side of Tenth Ave., New York city, to the commencement of the iron-lined tunnels, and extending westward from there to the Weehawken Shaft, New Jersey.

(3) The Bergen Hill Tunnels, under the charge of F. Lavis, M. Am. Soc. C. E., Resident Engineer, including the rock tunnels from the Weehawken Shaft to the Hackensack Portal on the west side of the Palisades, all in New Jersey.

Table I shows the quantities of certain materials and other statistics regarding this division.

The grade adopted was approximately 2 per cent descending westward from Ninth Ave., which would place the tunnel well below the government dredging plane of 40 ft. below mean low water at the pier head line; thence westward on a lighter grade still descending until the deepest portion of the river was

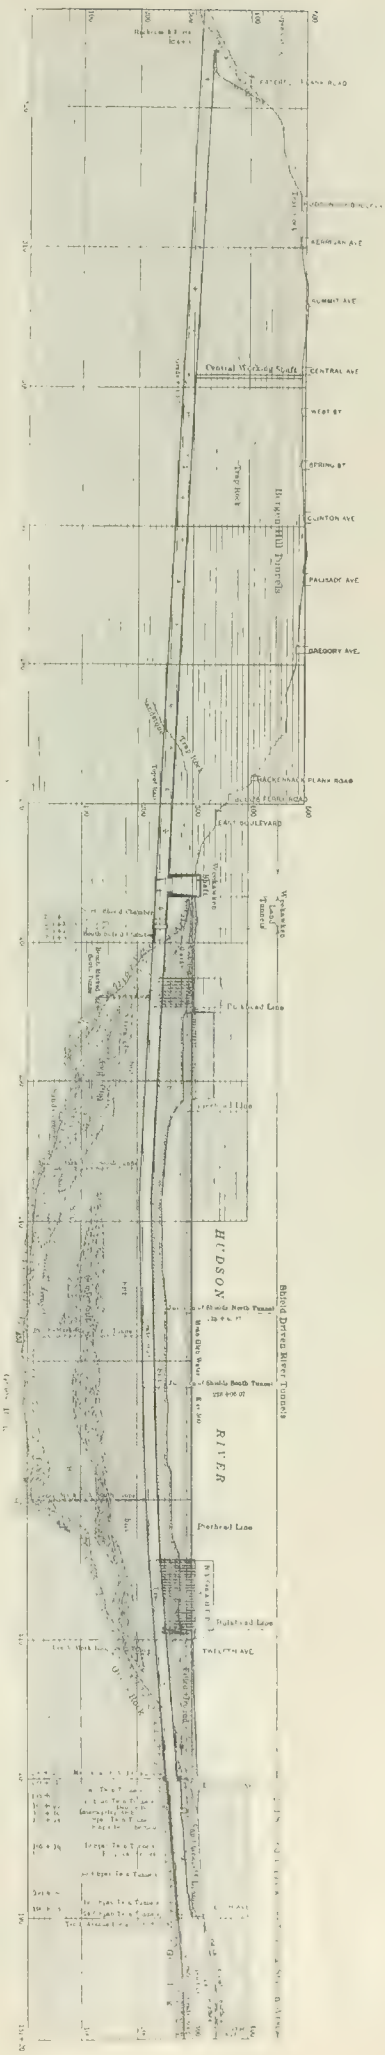

Fig. 1—Profile of North River Tunnels of the Pennsylvania R. R., New York City.

*Abstracted from a paper by Charles M. Jacobs, published in Proceedings, American Society of Civil Engineers, Vol. XXXVI, No. 1, p. 134.

reached where the top of the rail would be about 90 ft. below mean high water, this location giving sufficient cover over the tunnels to insure stability and guard against the possibility of shipwrecks settling on the tunnels. From this point to the portal an ascending grade of 1.30 per cent was adopted, which gave the lines sufficient elevation to cross over the tracks of the New York, Susquehanna and Western and the Erie Railroads, which run along the westerly base of the Palisades. Owing to the exigencies of construction, these grades in the river were very slightly modified. Fig. 1 is a profile of the tunnels as constructed.

The Board of Engineers early in 1902 took up the question of supports for the tunnels under the North River, and various plans and schemes were considered. It was finally decided to support the tracks on screw-piles carried through the lining of the tunnels, as originally proposed by the writer.

In order to know something of the capacity of the screw-piles in the actual material to be passed through, it was resolved to test them. A caisson was sunk at the end of one of the Erie R. R. piers on the New Jersey side near the line of the tunnels, and, to obtain parallel conditions as much as possible, the excavation was carried down to the proposed grade of the tunnel. Various types of screw-piles were sunk therein and tests were made, not only of the dead load carrying capacity, but also with the addition of impact, when it was found that screw-piles could be sunk to hard ground and carry ground and carry the required load. The final part of the test was the loading. The screw-pile, having a shaft 30 in. in diameter and a blade 5 ft. in diameter, was loaded with 600,000 lbs. with the result that, for a month—the duration of this loaded test—there was no subsidence.

Again, and after the iron tunnel lining had been constructed across the river, tests were made of two types of supports: One a screw-pile 29½ ins. in diameter with a blade 4 ft. 8 ins. in diameter and the other a wrought-iron pipe 16 ins. in external diameter. Tests were made, not only for their carrying capacity, but also for their value as anchorages, and it was found that the screw-pile was more satisfactory in every way; it could be put down much more rapidly; it was more easily maintained in a vertical position, and it could carry satisfactorily any load which could be placed on it

as a support for the track. The 16-in. pipe did not prove efficient either as a carrier or as an anchorage. Figs 2 and 3 illustrate the general arrangement and details of the machine designed by the writer and used for sinking the test piles in the tunnels. This machine had been used originally on the New Jersey side on the test pile at Pier C, and the the pile-driver. Each boring was continued, and the depth of several was more than 250 ft. below the surface of the water. The borings on land were mostly core borings, and were generally made with the chilled shot boring machine.

Base lines, about 2,250 ft. in length, were measured on each side of the river, and ob-

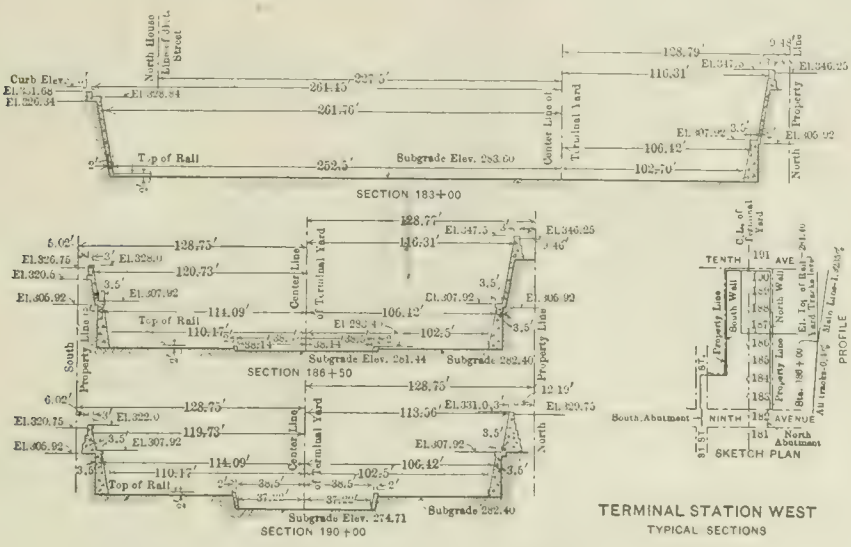

Fig. 4—Typical Sections of Terminal Station Excavation.

adaption was not exactly as shown on these drawings, but if the screw-piles had been placed in the tunnels, the arrangement shown would have been used.

Surveys, soundings and borings were commenced in the latter part of 1901 on an assumed center line of tunnels which was the center line of 32d St. extended westward.

The soundings were made from a float stage fastened to a tugboat, the location being determined by transit on shore and the elevation by measuring from the surface of the water, a tide gage being continually observed and the time of soundings and gage readings kept.

In the river wash-borings were made from a floating pile-driver on which was installed a diamond-drill outfit of rods, pump etc. Fourteen borings were completed in the river. Considerable difficulty was found in holding the pile-driver against the current, the material in the bottom being very soft, and several borings were lost owing to the drifting of

servation points established. It was necessary to build a triangulation tower 60 ft. high on the New Jersey side as an observation point. The base lines were measured with 100-ft. steel tapes which were tested repeatedly, and the work was done at night in order to obtain the benefit of uniform temperature and freedom from traffic interruptions. From the base line on the New Jersey side, which passed over the Weehawken Shaft, an elevated point on the assumed center line of the side of Bergen Hill was triangulated to, and from this point westward a closed polygon was measured along the streets to the top of the hill on the west side and thence along the assumed center line to the portal. The level transfer across the river was made by sighting across in opposite directions simultaneously, and also by tide gages.

The decision as to the locations of the shafts on both sides of the river, for construction purposes and finally for permanent use, was a comparatively simple matter, and, all circumstances considered, they are unquestionably in the most suitable places. On the New York side the shaft was as near as practicable to the line dividing the subaqueous iron-lined tunnels from the land tunnels, and on the New Jersey side the shaft was placed centrally on the line of the tunnels and on the nearest available ground to the river, while at the same time beyond the other end of the river tunnels, thus necessitating driving the subaqueous tunnels only from east and west to meet under the river. A caisson shaft on the New York side, on the line of the tunnels near the river bulkhead, was at one time considered, but was not adopted, as it entailed the driving of two shields both east and west, in addition to the two from New Jersey, adding to the plant out-

lay while not affording any material saving in the time of construction.

It was thought desirable to construct the shafts on the two sides of the river in advance of letting the main contracts for the tunnels. The Manhattan Shaft is north of the line of the tunnels, on the north side of 32d St., east of Eleventh Ave. The Weehawken Shaft is on the line of the tunnels in the yards of the Erie R. R. on the New Jersey side, and the distance between the shafts is about 6,575 ft. The contracts for these shafts were let in June, 1903, to the United Engineering and Contracting Company, and they were completed and ready for use at the time of letting the main contract for the tunnels, thus saving considerable time.

The Terminal Station-West, Between Ninth and Tenth Avs.—In the original design it was contemplated to have a four-track tunnel un-

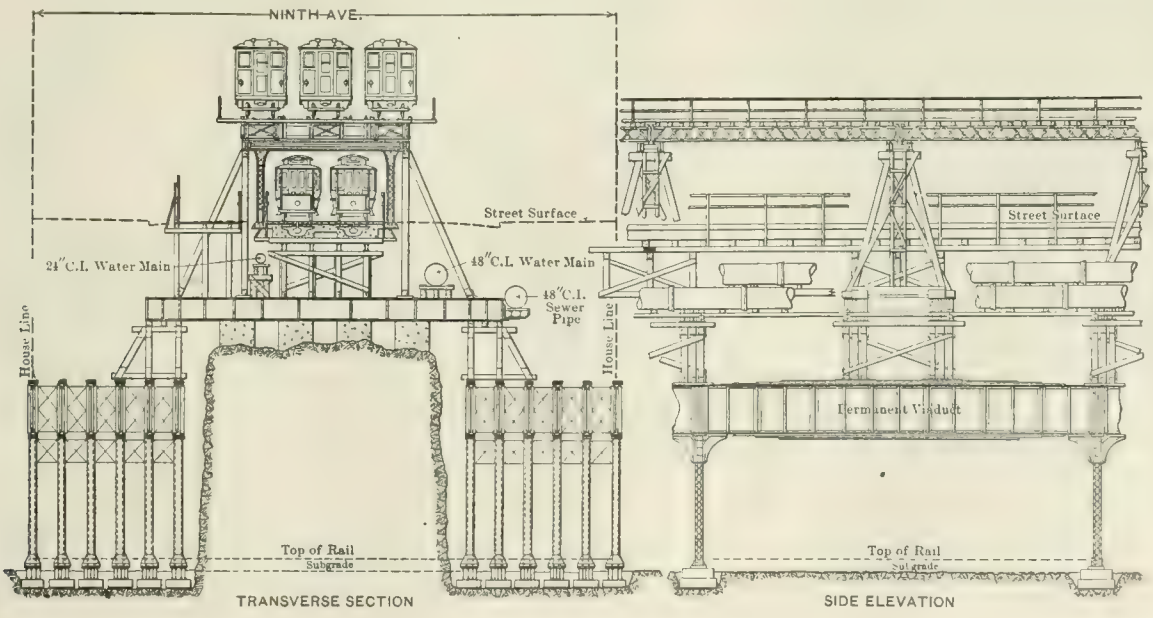

Fig. 5—Arrangement of Structures Supporting Ninth Ave. Elevated Railroad.

der 32d St. from Ninth to Eleventh Aves., but owing to the necessity for having additional yard facilities, property was bought for about 100 ft. north and 100 ft. south of 32d St., between Ninth and Tenth Aves., and an open excavation, lined with concrete retaining walls and face walls, was made. Between Ninth and Tenth Aves., 32d St. was closed, and the property formerly the street was bought by the tunnel company from the city of New York. The church, rectory and school of St. Michael's, which was located on the west side of Ninth Ave., between 31st and 32d Sts., was acquired by the tunnel company after it had acquired property for and had built a similar institution on the south side of 34th St. west of Ninth Ave.

Probably the most interesting feature of this contract was the support and maintenance of Ninth Ave., which has a three-track elevated railway structure and a two-track surface railway structure, on which it was necessary to maintain traffic while excavation was made to a depth of about 60 ft., and a viaduct was erected to carry Ninth Ave. The length of this viaduct is about 375 ft., and the steel work and its erection was done apart from the North River division work, but all excavation and underpinning was included in this division. The contract for this work on the Terminal Station-West was let to the New York Contracting Co. on April 28, 1906, and included about 517,000 cu. yds. of excavation, about 87 per cent being rock, the construction of about 2,000 lin. ft. of retaining and face walls containing about 18,500 cu. yds. of concrete, and a large quantity of structural steel (1,475,000 lbs.) for temporary use in underpinning Ninth Ave. Fig. 4 shows cross-sections of the Terminal Station-West yard, and Fig. 5 shows the general method of underpinning the Ninth Ave. structures.

River Tunnels.—In the original plan a four-track tunnel was contemplated from the east side of Tenth Ave. to the east side of Eleventh Ave., but, owing to the extension of the Terminal Yard, previously noted, this plan was changed, and a two-track structure was built having a central wall between the tracks. This was constructed in tunnel, with the exception of 172 ft. about midway between Tenth and Eleventh Aves., where the rock dipped below the roof of the tunnel, and there the construction was made in open cut. These tunnels were lined with concrete with brick arches. This work was executed by the O'Rourke Engineering Construction Co.

It was possible to excavate in full rock cover about 250 ft. of the tunnels eastward from the Weehawken Shaft and 225 ft. westward from the Manhattan Shaft. At these points the rock cover was very thin, and there shield chambers were made for the erection of two sets of shields, about 6,100 ft. apart.

The Board of Engineers decided, and it was so stated in the contract and specifications, that the river tunnels should be constructed by means of hydraulic shields, but bidders were permitted to present to the board any scheme on which they might desire to bid, but, of course, the decision as to the practicability of such plans rested with the board.

Inasmuch as the shield method of construction was required, the writer designed a shield for use in the North River tunnels. The shield was about 18 ft. long, over all, and was provided with a rigid but removable hood extending beyond the normal line of the cutting edge, for use in sand, gravel and ballast, to be removed when the shield reached the silt. The shields were thrust forward by 24 rams, capable of exerting a pressure of 3,400 tons at a hydraulic pressure of 5,000 lbs. per sq. in. Taking into account 30 lbs. air pressure, this pressure was increased to 4,400 tons. The

shield was fitted with a single hydraulic erector and hydraulic sliding platforms, and when complete weighed 194 tons. The shields were built in accordance with the design previously referred to, and proved entirely satisfactory. Generally, the materials passed through were as follows: Starting out in full face rock, from it into a mixed face of rock and sand, thence into sand and gravel, full face of sand, piles, rip-rap and the Hudson silt; and all were fully charged with water. The contract for the river tunnels was let to the O'Rourke Engineering Construction Co.

Compressed air, at an average gage pressure of about 25 lbs. and a maximum of 40 lbs. per sq. in., was used in the tunnels from the time the shields emerged from full rock face until the tunnel lining had been joined up and all calking and grummeting had been done.

Contractor's plants were established at the Weehawken Shaft and at the Manhattan Shaft, including at each, low-pressure air compressors of a capacity of 13,000 cu. ft. of free air per minute and also high-pressure air compressors for drills, hydraulic pumps, electric generators, etc.

The river tunnels passed under Pier 72, North River (old No. 62), which was occupied by the New York Central and Hudson River Railroad Co. The tunnel company leased this pier and withdrew all the piles on the lines of the tunnels prior to the commencement of construction, and on the remaining piles constructed a trestle for the disposal of the excavation from the tunnels and the terminal. At the completion of the work this pier had to be restored, and Fig. 6 shows the general arrangements of the location of the piles and the pier structure with reference to the tunnels.

In the tunnels which were constructed in silt farther down the river, by the writer as Chief Engineer for the Hudson Companies, it had been possible to shove the shield through the silt with all the doors closed, displacing the ground and making great speed in construction owing to the absence of all mucking. It was thought that this procedure might be pursued in the larger tunnels of the Pennsylvania R. R., and it was tried, but it was almost immediately found to be impossible to maintain the required grade without taking a certain quantity of muck into the tunnels through the lower doors, the tendency of the shield being to rise. By taking in about 33 per cent of the excavation displaced by the tunnel, the grade could be maintained. It was considered desirable, owing to this rising of the shields, to increase the weight of the cast-iron lining, and this was done, making the weight of the completed tunnel more nearly equal to the weight of the displaced material. The weight of the cast-iron lining (with bolts) was increased from 9,609 to 12,127 lbs. per lin. ft. of tunnel. The weight of the finished tunnel with this heavier iron is 31,469 lbs. per lin. ft. The weight of the silt displaced per linear foot of tunnel, at 100 lbs. per cu. ft., is 41,548 lbs. The weight of the completed tunnel with the maximum train load is 41,869 lbs. per lin. ft.

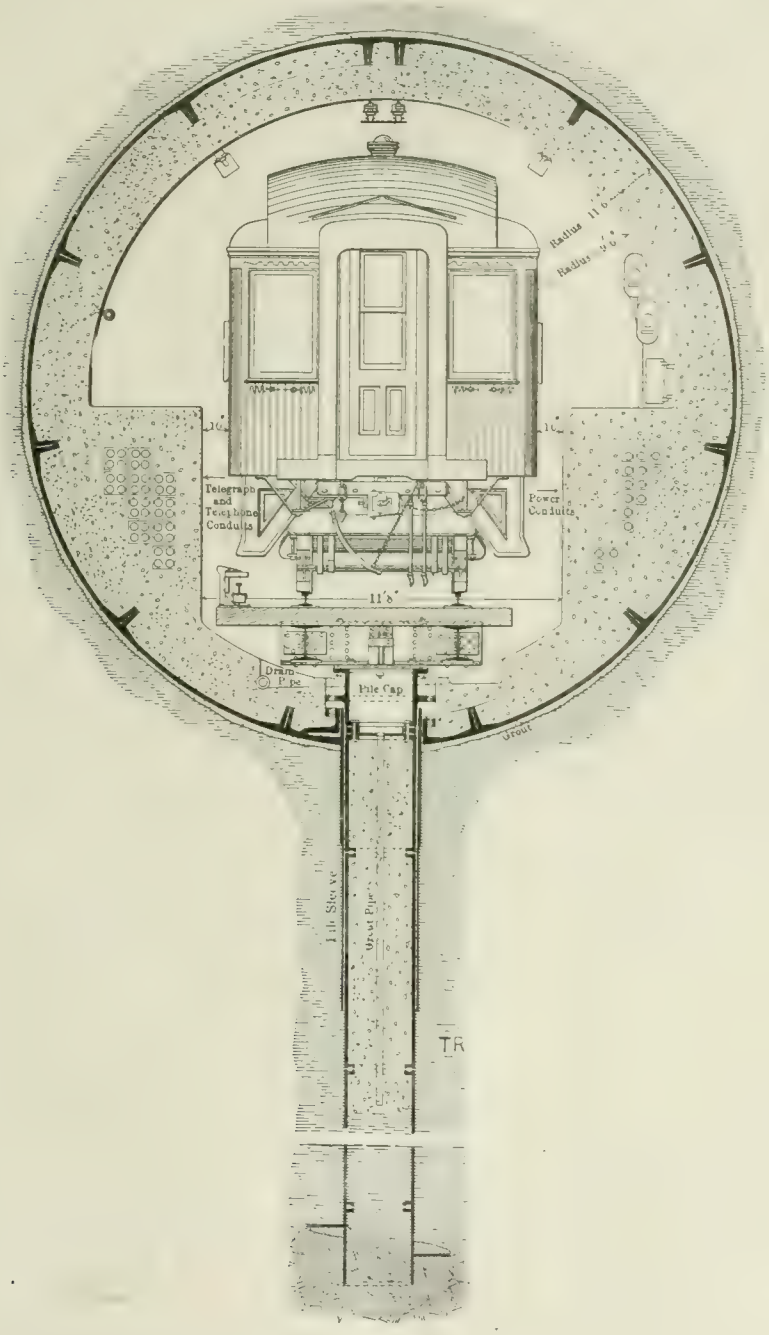

Fig. 8—Designed Cross-Section of Tunnel with Screw Pile Supports.

The maximum progress at one face in any one month was 545 ft., working three 8-hour shifts, and the average progress in each heading while working three shifts was 18 ft. per 24 hours; while working one shift with the heavier lining referred to above, the delivery of which was slow, the average progress was 11 ft. per 24 hours.

In order to permit the screw-piles to be put in place through the lining, cast-steel bore segments were designed, and placed in the invert at 15-ft. centers; these are of such a design as to permit the blade and shaft of the screw-pile to be inserted without removing any portion of the lining. Figure 8 is a typical cross-section of the river tunnel, as originally planned, with these pile supports.

After the shields had met and the iron lining was joined up, various experiments and tests were made in the tunnel; screw-piles and 16-in. pipes, previously referred to, were inserted through the bore segments in the bottom of the tunnel, thorough tests with these were made, levels were observed in the tunnels during the construction and placing of the concrete lining, an examination was conducted of the tunnels of the Hudson and Manhattan Railroad Co. under traffic, and the result of these examinations was the decision not to install the screw-piles. The tunnels, however, were reinforced longitudinally by twisted steel rods in the invert and roof, and by transverse rods where there was a superincumbent load on the tunnels; it might also be noted that on the New York side, where the tunnels emerge from the rock and pass into the soft material, the metal shell is of cast steel instead of cast iron. Figure 7 is a typical cross-section of the river tunnels as actually constructed.

During the investigations in the tunnels, borings were made to determine exactly the character of the underlying material, and it was then found that the hard material noted in the preliminary wash-borings was a layer of gravel and boulders overlying the rock. When the borings in the tunnels reached this material it was found to be water-bearing and the head was about equivalent to that of the river. Rock cores were taken from these borings, and the deepest rock was found at about the center of the river at an elevation of 302.6 ft. below mean high water. Rods were then inserted in each bore hole and thereby attached to the rock and used as bench-marks in the tunnels. From these bench-marks, using specially designed instruments, very accurate observations of the behavior of the tunnels could be made, and from these the very interesting phenomenon of the rise and fall of the tunnels with the tide was verified, the tunnels being low at high tide and the average variations being about 0.01 ft. in the average tide of about 4.445 ft.; the tidal oscillations are entirely independent of the weight of the tunnels, since observations show them to have been the same both before and after the concrete lining was in position. There was considerable subsidence in the tunnels during construction and lining, amounting to an average of 0.34 ft. between the bulkhead lines. This settlement has been constantly decreasing since construction, and appears to have been due almost entirely to the disturbances of the surrounding materials during construction. The silt weighs about 100 lbs. per cu. ft. (this is the average of a number of samples taken through the shield door, and varied from 93 to 109 lbs. per cu. ft.), and contains about 38 per cent of water. It was found that whenever this material was disturbed outside the tunnels a displacement of the tunnels followed. The tunnels as above noted have been lined with concrete reinforced with steel rods, and prior to the placing of the concrete the joints were calked, the bolts grummeted and the tunnels

rendered practically water-tight; the present quantity of water to be disposed of does not exceed 300 gal. per 24 hours in each tunnel 6,100 ft. long.

Bergen Hill Tunnels.—These are two single-track tunnels, 37 ft. from center to center, and extend for a distance of 5,940 ft. from the Weehawken Shaft to the Hackensack Portal. They were built almost entirely through trap rock. The contract was let on March 6, 1905, to the John Shields Construction Co., but was re-let on January 1, 1906, to William Bradley, the Shields Co. having gone into the hands of a receiver. About 1,369 ft. of the tunnel excavation was done by the Shields Co., but no concrete lining. The maximum monthly progress for all headings was 622 ft., and the average progress was 338 ft. A working shaft 216 ft. deep was sunk from the top of the hill, to facilitate construction. The tunnels are lined with concrete throughout.

Inner Harbor at Balboa.—Tentative plans have been prepared for an inner harbor at Balboa, the Pacific end of the Panama Canal, and the resident engineer at Balboa has received authority to begin preliminary work by removing the partly submerged French machinery that is now scattered over a large part of the area of the proposed basin. The total area will be approximately 176 acres, and the greater part of it outside of the Canal channel, will have to be dredged, the estimated amount of material required to be removed aggregating 10,000,000 cu. yds. At the present time, a long spit of land, showing above water, extends down to about opposite the shipways at Balboa, separating the Canal channel from the river entrance, and this will involve the heaviest part of the dredging within the basin. The harbor will have a uniform depth of about 40 ft. at mean low tide. When the basin is completed, plans will probably be considered for a permanent system of piers, or docks, extending from the sand dock along the east side of the harbor, and if the shipping business at that time shall appear to justify such construction, along the north end of the harbor, as well. The Rio Grande channel will be eliminated by the formation of Lake Miraflores, and much of the ground in the immediate vicinity of the harbor, now low and partly covered by water at high tide, will be reclaimed. It has been proposed that the piers be constructed to extend directly out from shore, at distances of about 500 ft. apart, which will enable ships of any tonnage to berth alongside, two to each dock.

Notes on Cleaning Sewers at Washington, D. C.—The total length of sewers in the District of Columbia on June 30, 1909, was 541 miles. Of this amount 424 miles were pipe sewers and 117 miles were main sewers. In addition there were 3 340 storm water receiving basins and ten general catchment basins. The maintenance of all these comes under the direction of the Superintendent of Sewers and in the report of the Engineer Department of the District of Columbia in the last fiscal year he gives some data in the cleaning of the sewers and basins. The following shows the cost of cleaning the sewers:

Cleaning the sewers.	Amount lin. ft.	Cost per lin. ft.
Main sewers cleaned	11 624	$0.255
Pipe sewers cleaned	1 [illegible] 115	.0042
Pipe sewers flushed	1 873 142	.0006

A total of 114 miles of main sewers was inspected at a cost of $8.61 per mile. In audition 52,634 storm water receiving basins were cleaned. the total amount of sludge removed being 188,460 cubic feet. The cost of cleaning the basins was $13.841,08 or about $2 per cubic yard of sludge removed. Nine gravel catchment basins were cleaned, the total of sludge removed being 4,968 cubic feet. The cost of cleaning the catchment basins was $576.71 or about $3.14 per cubic yard of sludge removed.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Detailed Cost of Constructing 2,070 Sq. Yds. of Brick Pavement At Carlisle, Pa.

BY C. A. BINGHAM,* ASSOC. M. AM. SOC. C. E.

Over 3,000 sq. yds. of vitrified brick pavement were laid in Carlisle, Pa., during the past season by the Street Department under the direction of the writer, the street department being in full charge of the City Engineer. Fortunately during the past 160 years the streets have been filled with subsequent layers of macadam until there is a foundation of at least 18 ins., so that it was not considered necessary to lay a concrete base.

To procure subgrade it was necessary to remove from 2 to 5 ins. of the old macadam by spiking with the roller and scarifier. This was hauled to outlying streets to make temporary surfaces. About 400 sq. yds. were graded in a day by the roller, one foreman, three laborers and three carts, hauling about three-quarters of a mile. The resulting surface was then raked, leveled and additional crushed limestone applied to give the proper contour. It was then thoroughly wet and compactly rolled with a 13-ton steam roller and allowed to dry out for a couple of days. In short, a finished macadam surface was constructed 5¼ ins. below grade. Iron grade pins were then placed every 8 ft. each way by the "shooting" method with a transit. The next operation was to place screeds along these grade points, and with a straight edge level off the cushion, which was 1½ ins. of crusher dust. This dust was cheaper than sand and did not become disturbed if stepped upon for any unavoidable reason. By keeping a considerable amount ahead of the straight edge it was found to pack and give a very firm bed. One cubic yard of this dust covered about 30 yds. of surface.

As to the method of storing the blocks, it was found to cost exactly the same whether they were stacked at the freight yard and hauled to the street as needed, or hauled directly from the cars and stacked along the street until used. This cost was $1.74 per thousand blocks and the haul was one-half mile. The first method will be pursued in the future because by the other way the sidewalks are congested both to merchants and pedestrians.

A gang of five men laid an average of 8,500 bricks per day, the foreman and one helper laying and the others carrying and wheeling blocks. The best day's work was 12,000. After a careful inspection the bricks were rolled with a 4-ton horse roller, the steam roller being too heavy. Part of the rolling was done by horses and part by eight men. There was very little difference in the costs, but while pads on the horses' feet prevented the disturbing of the blocks, it was found impossible to do the cross rolling as could be done by hand. The cement grout used was a 1 to 2 mixture, and it was found that it required one bag of cement for each 14 yds. of pavement, and one foreman and three men could grout 700 sq. yds. a day. Wedge shaped strips were placed along each curb for pitch expansion joints, but before the strips could be removed the weather became unfit for working and the joints will not be completed until next season.

The following cost data are on 2,070 sq. yds., on which very accurate account was kept on time and material. The street was 55 ft. between curbs and a trolley track covered 135 sq. yds. of the center. This portion did not require grading, because when the traction company retimbered it was laid with concrete to the proper subgrade. The cost of laying bricks between the tracks was found to be practically the same as in the open street and is all included in the following data. The total cost of the completed pavement per square yard was $1.09.

The detailed cost of this 2,070 sq. yds. of brick pavement was as follows:

	Total.	Per sq. yd.
SPIKING UP AND CARTING OFF OLD MACADAM.		
Roller engineer, 45 hrs. at $0.20	$ 9.00	$0.0046
Foreman, 55 hrs. at $0.17	9.35	.0048
Laborers, 261 hrs. at $0.14	36.54	.0188
Carting, 192 hrs. at $0.25	46.08	.0238
Coal, 2.5 tons at $4.00	10.00	.0052
Total (1,935 sq. yds.)	$110.97	$0.0572
RAKING, LEVELING, ROLLING, ETC., MACADAM BASE.		
Foreman, 34 hrs. at $0.17	$ 5.78	$0.0029
Roller engineer, 39 hrs. at $0.20	7.80	.0040
Laborers, 56 hrs. at $0.14	7.84	.0041
Crushed stone, 69 cu. yds. at $0.98	67.62	.0349
Coal, 2 tons at $4.00	8.00	.0041
Total (1,935 sq. yds.)	$ 97.04	$0.0500
DUST CUSHION.		
Foreman, 25 hrs. at $0.17	$ 4.25	$0.0020
Laborers, 50 hrs. at $0.14	7.00	.0033
Crusher dust, 66 cu. yds. at $0.98	64.68	.0312
Total (2,070 sq. yds.)	$ 75.93	$0.0365
UNLOADING, HAULING, STACKING BLOCKS.		
Foreman, 45 hrs. at $0.17	$ 7.65	$0.0037
Laborers, 390 hrs. at $0.14	54.60	.0264
Carting, 363 hrs. at $0.24	87.12	.0421
Total (2,070 yds.)	$149.37	$0.072
BLOCK.		
85,660 at $19.00 M	$1,627.54	or $0.786 yd.
LAYING BLOCKS.		
Foreman, 127 hrs. at $0.17	$ 21.59	$0.0104
Laborers, 402 hrs. at $0.14	56.28	.0271
Total (2,070 sq. yds.)	$ 77.87	$0.035
ROLLING AND INSPECTING.		
Team, 15 hrs. at $0.20	$ 3.00	$0.001
Laborers, 63 hrs. at $0.14	8.82	.004
Total (2,070 sq. yds.)	$ 11.82	$0.005
GROUTING.		
Cement, 44 bbls. at $1.20	$ 52.80	$0.0254
Sand, 11 tons at $1.40	15.40	.0074
Foreman, 32 hrs. at $0.17	5.44	.0071
Laborers, 106 hrs. at $0.14	14.84	.0091
Sand covering, 5 tons at $1.40	7.00	.0034
Total (2,070 sq. yds.)	$ 95.48	$0.0459

RECAPITULATION.

	Per sq. yd.
Excavation	$0.057
Grading	0.050
Cushion	0.036
Haul, etc.	0.072
Blocks	0.786
Laying	0.037
Rolling	0.005
Grouting	0.046
Grand total	$1.089

*City Engineer, Carlisle, Pa.

Method of Repairing Openings in Pavements.*

That two workmen with tools and materials of equal value may, when working to the same end, produce very different results is acknowledged. If we apply this principle to any construction which by its nature is of constantly recurring necessity, such, for instance, as street pavements, the importance of attaining the maximum efficiency in workmanship becomes at once apparent.

The repairing of holes in pavements seems to offer the best field for developing to the fullest extent the value of first class workmanship. This has recently been brought home to those interested in street paving in Chicago by Mr. John B. McInerney, superintendent of repairs and maintenance. Before he took hold the repair of an opening was usually made in the

*From a paper by W. W. Marr, Division Engineer Board of Local Improvements, Chicago, Ill., read before the annual meeting of the Illinois Society of Engineers and Surveyors.

cheapest way possible and with little or no regard for how long it would stay in place or give satisfaction in any form. Now repairs are made with great care under the eye of an inspector skilled in this sort of work. A careful record is kept of repairs made and at the first signs of failure the contractor is required to make the repair again at his own expense. Mr. McInerney has demonstrated that an opening can be repaired in such a way that it cannot afterward be found. This requires great care, but it is worth all the time and money it takes.

The results of Mr. McInerney's efforts are particularly noticeable in asphalt repairs, which are made in the following manner: The dirt from all openings is tamped back in shallow layers and care is taken to see that the top of the opening is larger in horizontal area than any other part. The dirt is crowned up slightly over the trench or opening and the old asphalt laid on top. This is allowed to remain in place for several weeks if the traffic conditions do not make such a course seriously objectionable. The material above sub-grade is then removed and the concrete (nearly all asphalt pavements in Chicago are laid on concrete) is trimmed with a bevel edge so that the size of the opening in the concrete is 1 or 2 ins. less at the bottom than at the top in each direction. This edge is then thoroughly cleaned, wet, and sprinkled with neat cement. The concrete is then well rammed in place, no allowance being made for settlement and no crown on the top above the grade of the original concrete. After the new concrete has set the asphalt is cut to a sharp line with a vertical edge and three or four inches larger than the opening. This edge is very carefully painted with asphaltic cement after the binder has been well tamped in place. The surface mixture is always rolled with both a light and a heavy roller in such a way that it is finally brought to the even and unbroken surface of the original pavement.

Notes on State Highway Work in 1909.

NEW CASTLE COUNTY, DELAWARE.

During the year 1909 a total of 15 miles of macadam road was completed under the direction of Francis A. Price, New Castle county state highway commissioner. All except two miles of this road was macadamized for a width of 12 ft., the two miles being macadamized for a width of 16 ft. The thickness of completed pavement was 4 ins., 6 ins., and 8 ins., and the average cost per mile was $7,000. About 0.35 mile of bituminous macadam road, 12 ft. wide and 6 ins. deep, was constructed, the average cost per mile being $6,260. In addition 700 lin. ft. of Amiesite road was placed under construction. The average width of this type of road was 12 ft., the thickness of completed pavement was 6 ins., and the average cost per mile was $10,000. About $249,000 is available for road construction in 1910, and it is expected that about 27 miles of improved roads will be built.

KENTUCKY.

At an election last fall this state voted to amend its constitution so as to provide for improved roads. A bill is now before the state senate providing for a state roads department, with a competent engineer at the head. The bill also provides for county engineers to be elected by the fiscal court. The engineer at the head of the State Roads Department is to receive a salary of $2,400 a year, provided the bill as at present framed is enacted, and county engineers are to receive not less than $300 nor more than $1,800 a year. The bill provides for special elections in each county to determine whether a special tax shall be levied in that county for good roads. Fifty tax payers of a county may petition the county court to call an election on the good roads proposition. The bill provides state aid to the extent of 5 cts. on every $100 of taxable property in the state, this aid to be given each county in proportion to the amount raised in that county for good roads.

MARYLAND

The work of road improvement in Maryland is carried on under the direction of two commissions, the highway division of the Maryland Geological and Economic Survey Commission and the State Roads Commission of Maryland. Mr. W. W. Crosby, Baltimore, Md., is chief engineer of both of these commissions. The following table shows the mileage and average cost per mile of roads completed in 1909 under the direction of the Maryland Geological and Economic Survey Commission:

Kind.	Total miles built.	Av. width paved, feet.	Av. thickness of completed pavement, inches.	Av. cost per mile.
Gravel	1.31	12	8	$6,138.26
Macadam	30.45	12&14	6&8	9,898.66
Brick	None.			
Sand clay	1.00	18	9	3,120.50
Oyster shell	4.57	11	9	5,384.46
Pitching macadam	.75	24	*4	9,041.70

*Resurfacing.

The average unit prices in 1909 for road work were as follows:

Gravel, per sq. yd., in place	$0.42
Broken stone, per sq. yd., in place	.78
Shell, per sq. yd., in place	.69
Excavation, per cu. yd.	.51
Concrete masonry, per cu. yd.	8.14
Stone masonry, per cu. yd.	6.97

The prevailing daily wages in 1909 per 10-hour day were as follows:

Common labor	$1.50
Two-horse team and driver	4.00

The road work projected for 1910 by the Maryland Geological and Economic Survey Commission is as follows:

Kind.	Miles to be built.	Estimated cost.
Gravel	2.06	$ 10,186.53
Macadam	26.75	240,035.45
Oyster shell	11.44	*103,190.21
Pitching macadam	5.25	28,193.73
		$381,610.92

*Includes steel draw bridge.

None of the roads being built under the direction of the State Roads Commission of Maryland was completed and accepted in 1909. The average unit prices for road work in 1909 under this commission were as follows:

Gravel, per sq. yd., in place	$0.45
Broken stone, per sq. yd., in place	.917
Brick, per sq. yd.	2.13
Excavation, per cu. yd.	.425
Concrete masonry, per cu. yd.	8.14
Stone masonry, per cu. yd.	6.97

The road work projected for 1910 by the Maryland Roads Commission is as follows:

Kind.	Miles to be built.	Estimated cost.
Gravel	4.64	$ 31,351.55
Macadam	87.83	888,873.98
Brick	1.088	59,217.17
Pitch macadam	6.45	96,464.77
Grading and draining only	7.74	24,924.25
	107.748	$1,100,831.72

In addition to the work noted above, the highway division of the Maryland Geological Survey is carrying on extensive investigations regarding road preservatives and dust preventives, both in the laboratory and outside. One particularly interesting piece of work was the treating of about four miles of macadam, adjacent to Baltimore city, with ten different varieties of bituminous materials applied in contiguous stretches to two different sections of this road, the sections being separated by an interval of about two miles of untreated macadam. Each car load of material used was analyzed according to the forms and methods of the special committee of the American Society of Civil Engineers on "Bituminous Materials Used in Road Making." A careful record of these analyses has been kept as well as of the costs of the various items, other than the material itself, entering into the expense of this work.

MASSACHUSETTS.

During the fiscal year ending Nov. 30, 1909, a total of 35.09 miles of road was completed under the direction of the Massachusetts Highway Commission. These roads were of the gravel and macadam type of construction, the number of miles built and the average cost per mile being as follows:

Kind.	Total miles built.	Av. width.	Av. thickness.	Av. cost per mile.
Gravel	2.53	15	5	$3,729.45
Macadam	32.56	15	5	8,177.38

The average unit prices for work in 1909 were as follows:

Gravel, per cu. yd., in place	$ 0.90
Broken stone, per ton, in place	1.70
Earth excavation, per cu. yd.	0.50
Rock excavation, per cu. yd.	1.75
Concrete masonry, per cu. yd.	12.00
Stone masonry, per cu. yd.	6.00

The prevailing daily wages for an 8-hour day were:

Common labor, per day	$2.50
Two-horse team and driver	5.00

It is estimated that 50 miles of state highway will be constructed in 1910.

Arthur W. Dean, Boston, Mass., is chief engineer of the Massachusetts Highway Commission.

NEW HAMPSHIRE.

During the year 1909 a total of 58.44 miles of road were completed under the direction of the state engineer. The amount, type and average cost of the roads built were as follows:

Kind.	Total miles built.	Av. width paved, feet.	Av. thickness of completed pavement, ins.	Av. cost per mile.
Gravel	46½	15	8	$3,450
Macadam, trap rock	4.6	15	6	6,900
Macadam, native stone	6.04	15	6	5,300
Bituminous macadam	1.3	15	6	7,800

The average unit prices in 1909 were as follows:

Gravel, per cu. yd., in place	$0.98
Broken stone, per ton, in place	1.81
Telford, per sq. yd., in place	0.33
Earth excavation, per cu. yd.	0.55
Rock excavation, per cu. yd.	2.45
Concrete masonry, per cu. yd.	7.72
Stone masonry, per cu. yd.	4.82

The prevailing daily wages in 1909 for a 9-hour day were as follows:

Common labor	$1.75
Two-horse team and driver	4.00

H. C. Hill, Concord, N. H., is state engineer.

NEW YORK

On Feb. 17, 1909, the State Highway Commission was formed and took over the highway work which had previously been under the charge of the state engineer and surveyor. The present highway law brings the entire system of public highways in the state, outside of the four counties which constitute the city of Greater New York, under the direct charge and supervision of the State Department of Highways and provides for their improvement, maintenance and repair under three separate and distinct heads:

(1) State highways, composed of through routes running north and south and east and west across the state, aggregating about 2,800 miles in length, to be improved solely at the expense of the state.

(2) County highways, being the system of main market roads designated on the maps of the various counties approved by the legislature of 1907 as the system of roads to be improved at the joint expense of the state, county and town in the same manner as was provided by the Higbie-Armstrong act, the main provisions of which are incorporated in the present law. These aggregate about 7,500 miles.

(3) Town roads, embracing all roads not to be improved as state or county highways, and amounting to upwards of 70,000 miles. They are to be maintained and repaired as earth roads at the expense of the town plus the aid donated by the state, substantially in the manner provided by the money system acts hereinbefore described.

During the past year the commission has been engaged in locating the 38 state through routes. It was impossible to locate any of these routes in their entirety and prepare plans and specifications for improvement, advertise for proposals and award contracts in time for work to be commenced during 1909, but a sufficient location has been made in each county to take up $2,500,000 now available for state

routes, and contracts for that amount will be awarded during this winter and work commenced promptly in the spring of 1910.

The improvement of county highways was continued under the present law along virtually the same lines as under the former Higbie-Armstrong act. Up to Jan. 1, 1909, 1,787 miles county highways had been improved by state aid and 520 miles under contract were turned over by the state engineer and surveyor to the commission when it assumed control in February, 1909. The majority of this work has been already completed or will be early in 1910. Plans for the improvement of 1,038 miles had also been approved by the various boards of supervisors prior to Jan. 1, 1909. These roads are on the list from which they must be taken for construction in their regular numerical order, and they form the nucleus of the upwards of 300 miles of county highways designated for improvement in 1910, and for the payment of the state's share of which there is available the remaining $2,500,000 appropriated by chapter 439, laws of 1909.

The State Highway Commission in its preliminary report, from which these notes have been taken, makes a number of suggestions for the amendment of certain points of the highway law. Two of these suggestions refer to automobile traffic and experimental roads. Regarding these the commission states:

It is impossible with the data before the commission to determine the damage to the highways accruing from automobile traffic. This traffic, however, has compelled more expensive methods of construction which will in general aggregate at least $2,500 per mile, and this construction upon 500 miles of road will cost annually over $1,000,000. This does not take into account the large additional amount made necessary for repairs on the other roads, and it seems to us that an annual registration fee which will collect not less than $500,000 should be enforced, and that the entire proceeds of the same should be devoted to the care and maintenance of improved highways. A study of traffic conditions has convinced the commission that one kind of roadbed is neither suitable nor economical for all locations. Roads over which pass daily a thousand or more vehicles, of which one-half are swiftly moving and self-propelled, surely require a different form of construction than those over which pass daily 100 vehicles or less, mostly horse drawn. It is suggested that an appropriation of $80,000 be made for use by the commission in developing, through experiment, economical forms and methods of road construction which will be suited to various weights and classes of traffic. The money to be used as the commission deems best, in the purchase of suitable equipment and materials and payment for necessary labor. An appropriation so made will enable the commission to begin experiments and vary them to meet the different conditions encountered, until a satisfactory solution of each case has been reached.

UTAH.

The road laws in this state were enacted during the early part of 1909, and during that year no construction work was commenced. Caleb Tanner, Salt Lake City, Utah, is state engineer and has charge of the state highway work.

WISCONSIN.

At present all road building in this state is done by the towns and counties. The last legislature, however, appointed a special committee to consider the question of state aid and prepare a bill. This bill is about ready to be reported, and it is probable that a special session will be called in the near future. The highway division of the Wisconsin Geological Survey acts in an advisory capacity regarding the construction of improved roads. The division does not take complete charge of work for towns and counties, but is only with them for a longer or shorter time as their particular needs seem to require. Its work consists in assisting the towns and counties by laying out their roads for them, making estimates, and helping them to let contracts, or, as is more common, instructing the town chairman or some other person selected as foreman to build the road, as to what he should do. If possible an expert from the division stays with him until he becomes reasonably proficient in his duties, but it frequently happens that there are so many calls upon the small force that they cannot stay as long as they should on one piece of work. A very interesting and valuable part of the highway division's work is in assisting towns and counties in their bridge letting. The division makes standard plans for superstructures and when any town or county desires its assistance it makes an inspection of the bridge site, designs proper foundations, and notifies all bridge contractors of the time of the letting, and that all bids will be upon the standard plans prepared by the division. It has introduced the system of considering only sealed bids upon a single set of plans for the purpose of permitting proper competition and of preventing competition from resulting in inadequate structures. While there is no compulsion for the towns to call upon the division for this assistance, it is constantly in receipt of applications. W. O. Hotchkiss, Madison, Wis., is chief of the highway division, and A. R. Hirst is highway engineer.

Methods and Costs of Sidewalk Construction in Chicago.*

As cinder and cement walks are practically the only kind now being constructed in Chicago they will be the only ones given consideration in this paper.

CINDER WALKS.

Cinder walks are suitable as a safe walk for outlying and sparsely settled territory. They can be recommended only for cheapness in initial cost and for the fact that the cinders can later be used as a foundation for cement walks when the character of the territory will warrant same. Cinder walk consists of not less than 12 ins. of cinders, usually deposited in two layers between two rows of 2x6-in. hemlock plank or curbs, nailed to split cedar posts set 4 ft. apart from centers and driven not less than 15 ins. into the ground. The top of the curbing is set at the grade at which the walk is to be built (3 ins. below cement sidewalk grade) and backfilled with earth. The first layer of about 9 ins. can be either coarse cinders or slag. The second layer of 3 ins. should be of finer cinders. After these have been compacted a "crown" of fine, clean cinders is put on and the entire walk rolled with a roller of not less than 500 lbs. in weight. Some contractors prefer tamping with a regulation concrete tamper to rolling. These walks are objected to in districts which are built up to any extent on account of the cinders being "tracked" into the houses, destroying floors, carpets, rugs, etc., and are not recommended for any except vacant or sparsely settled districts.

The average cost of cinder walks in Chicago from 1901 to 1908 inclusive, based on the total cost ($2,375,359.10) divided by the total mileage 1,312.12, was 34.3 cts. per lin. ft. This includes many walks requiring a fill of 2, 3 and sometimes 4 or 5 ft. and can hardly be taken as a fair "average cost" for the ordinary cinder walk requiring only 15 ins. of cinders, including "crowning." The following itemized cost per lineal foot based on Chicago conditions and Chicago prices would be more nearly correct. Average depth of cinders 1.2 ft. by 6 ft., or 7.2 cu. ft. in place. Allow for 20 per cent shrinkage, 7.2÷ .8=9. cu. ft. loose.

Item.	Cents.
9 cu. ft. or 1/3 cu. yd. at 50 cts., in place	16.67
Lumber at $17.50 per M. 2 ft.	3.50
Stakes at 1 ct. per lin. ft. of material	1.12
Nails	1.
Waste on materials 1/2 of value	.71
Labor and excavation	4.50
	26.10
Add for supt., ther expense and profit 1 1/2	3.91
	30.01

Note.—The cost of labor is based on an average of prices obtained from several contractors.

CEMENT SIDEWALKS.

Cement sidewalks, consisting of a concrete base 4¼ ins. thick, composed of 1 part Portland cement, 2½ parts sand and 5 parts of broken limestone, washed gravel or crushed blast furnace slag, with a wearing surface ¾ in. thick, consisting of a mortar composed of 2 parts of Portland cement and 3 parts of screened torpedo gravel or granite screenings, giving a completed walk 5 ins. in thickness laid on a 9-in. foundation of broken slag, crushed stone, sand, cinders or other suitable material, are being laid on residence streets and on business streets where no use is made of the subsidewalk space, and concrete walks on standard I beams or of reinforced steel construction, wherever sub-sidewalk space is used, are being laid as the standard to the almost entire exclusion of walks of other materials. This can probably be accounted for by the fact that all necessary materials for their construction are produced or manufactured practically within the boundaries of the city. Within her borders or immediately adjoining, Chicago has mills which produce the necessary cement and steel, with a by-product of slag and cinders for use in foundations, quarries which produce crushed stone in unlimited quantities and pits which furnish all sand and gravel needed for concrete, while brick, tile and other sidewalk materials, such as are used in other cities, would have to be shipped in by rail at a considerable extra expense in freight charges and then would not be suitable for "vault" construction.

Location.—Under the terms of the ordinance of March, 1902, all walks except full-width walks must be laid on a line parallel to and 1 ft. from the lot line, except where otherwise ordered by special ordinance. Often, however, it is found necessary to change from the prescribed line in order to save shade trees. Again, on some streets, especially those on which the lots and buildings "side," the City Council, usually on petition from the property owners, passes an ordinance for laying the walk adjoining the curb—the plea being that this change in line is necessary to save the buildings from being defaced by children. The writer does not favor the laying of walks adjoining the curb, because it brings pedestrians in closer contact with the dust and dirt from the street, sprinklers, etc., and because there is more liability of interference from street traffic and from horses hitched or standing near the curb. Also more dust and street dirt is blown on the walk by reason of its closeness to the roadway.

Foundation.—Where filling is required to bring the sub-foundation to proper grade to receive the foundation, it should be deposited in layers not over 12 ins. in thickness; and each layer should be thoroughly compacted before the succeeding layer is put on. If clay is used for a filling, it should be deposited in layers not over 6 ins. thick. Soft and spongy places should be dug out and replaced with suitable material, which should be thoroughly compacted. Where excavation is necessary, it should be done to a depth of 14 ins. below sidewalk grade; and when required, suitable drainage should be provided for. The foundation or sub-base should be of clean, hard cinders, slag, crushed stone, sand, gravel, broken bricks or other similar materials, and should be of a depth of 9 ins. after being thoroughly compacted. The foundation should be kept wet while the concrete is being laid.

Materials.—The cement should be finely ground, uniform as to quality and color, delivered on the work in original packages, and kept dry until used; lumpy cement should not be allowed.

The sand should be clean, sharp, free from foreign substances, of sizes ranging from ⅛ in. down to the finest, and in such proportions as to give a maximum of density and a minimum of voids.

Granite screenings are too expensive except for the wearing surface, and when used for that purpose should be clean, dry, well graded, free from excessive dust and of sizes similar to those specified for sand. The use of limestone screenings in sidewalk concrete is not advised. The writer is well aware that screenings have shown very high in laboratory tests,

*Slightly condensed and rearranged from a paper by N. E. Murray, Superintendent of Sidewalks, Chicago, Ill., presented at the annual convention of the Illinois Society of Engineers and Surveyors, Cairo, Ill., Jan. 26-28, 1910.

both in crushing and tensile strength, but unfortunately they have not shown the same high efficiency when put to a practical test in sidewalks actually constructed, but have proved an almost complete failure. Thousands of feet of concrete walks in Chicago which were laid from 8 to 12 years ago, with a cement, limestone screenings and crushed limestone base, were torn out and relaid this year, having failed completely. This may have been due partly to the quality of screenings used, and, to some extent, to an insufficient amount of cement. At any rate, when the top composed of torpedo sand and cement was removed, the base could in almost every instance be shoveled out without being picked; and while limestone screenings may have proved a success in concrete used in foundations and underground work, they certainly have not been a success in sidewalk concrete where they were more exposed to the elements and to extremes of heat and cold.

The stone or gravel should be clean, sound, free from dust, loam, dirt and other foreign substances, of sizes not less than ¼ in., nor more than 1 in. in any dimension, and graded in such proportions as to give a maximum of density and a minimum of voids. For reinforced concrete, the stone should be not more than ¾ ins. in any dimension.

For the past few years the writer has done more or less experimenting with crushed blast furnace slag as a substitute for crushed limestone or gravel, as the coarse aggregate in concrete, and to date has not recorded a single failure. The city ordinance has recently been amended to allow the use of this material in concrete both in sidewalk and pavement construction.

Forms.—The wooden forms should be smooth, free from warp, and not less than 2 ins. thick and 5 ins. deep. They should be set to the lines and grades given by the engineer, their upper edges conforming to the grade of the finished walk, which should provide for a fall from the lot line to the curb line of 1 in. in 3 ft. to allow for proper drainage. The work should be blocked out in sections about 5x6 ft. in size, the cross forms 5 ins. in depth, extending full width of the walk and set at right angles to the side forms. For walks 5 ins. thick the blocks should not be over 6 ft. in any dimension. Expansion joints 1 in. wide should be provided for at least every 100 ft. and at all street and alley returns.

Proportions.—To obtain a proper mixture and the best results, materials for concrete should be proportioned according to the voids in the aggregate which varies with different materials. Owing to the many sources from which the different materials for walks were received, and the large number of gangs (over 300) using them, it was found impossible to follow this method in Chicago. This forced us to adopt an arbitrary mix proportioned as follows. For base: Cement 1 part, sand 2½ parts, and stone or gravel 5 parts. For wearing surface: Cement 2 parts, screened torpedo gravel or clean granite screenings 3 parts, as the one that would come the nearest to meeting all conditions. These proportions have been incorporated in our specifications as a part of our sidewalk ordinance.

Mixing and Laying—Base 4¼ ins. thick: The sand for a "batch" should be spread evenly on a water-tight platform and the proper proportion of cement spread on the sand. These materials should be mixed dry until the mass is of a uniform color and no streaks of cement show. Water should then be added and the mixing continued until mortar of an even consistency is obtained. Then the required stone or gravel, previously drenched, should be added and the mixing continued until each particle of the aggregate is thoroughly coated with mortar. If additional water is needed during the mixing, it should be added in the form of a spray. A medium "dry" mix is considered better than a "wet" mix for sidewalk concrete. Machine mixing is preferable to hand mixing, whenever a mixer can be used to advantage. After being mixed, the concrete should immediately be deposited on the foundation and tamped or rammed until solid and a film of moisture appears on the surface. The top of this course when completed should be a plane parallel with and ¾ in. below the grade of the finished walk. The cross forms should then be removed and the material for the next block deposited to preserve the joint.

Wearing course, ¾ in. thick: The mortar composed of 2 parts cement and 3 parts torpedo sand or granite screenings should be mixed in the same manner as the mortar for the base, with sufficient water to obtain a consistency that will not require tamping but will be readily floated with a straight edge. When partially set, the surface should be troweled until a smooth, even surface is obtained.

Backfilling.—Where walks are laid on a fill, they should be backfilled with earth or sand in such a manner as to leave a berm of 1 ft. on each side of and flush with the top of the finished walk, with a slope to the surface of the ground of one-half horizontal to one vertical.

Cost.—The cost of cement walk will vary with the cost of the materials delivered on the work, the cost of labor, the experience of the workman, the location and size of the piece of work to be done, the depth of filling, etc. It costs much more to deliver mixed concrete on a foundation raised 5 ft. above the ground than it does on a foundation ½ ft. above the ground. The average cost of cement walks laid in Chicago from 1901 to 1908 inclusive, based on the total cost ($8,918,278.77) divided by the total mileage (1,862.95), was $4,787.18 per mile, or 15.11 cts. per square foot. This price was for walks complete, including filling, which in many instances was from 2 to 6 ft. in depth and is not a fair average cost for the ordinary cement walk. Taking 1909 Chicago prices for labor and material, and using Taylor and Thompson's tables for quantities of cement and aggregates, we have the following as the average cost of material delivered on the work:

Cinders per cu. yd., delivered	$0.50
Cement per bbl., delivered (3.8 cu. ft.)	1.20
Sand per cu. yd., delivered	1.75
Gravel per cu. yd., delivered	1.50

The ordinary concrete sidewalk gang in Chicago is usually composed of six men paid as follows:

1 finisher, 8 hours at 62½ cts.	$ 5.00
1 helper 8 hours at 47½ cts.	3.80
4 laborers 8 hours at 37½ cts.	12.00
Total	$21.00

Under favorable conditions this gang will construct 900 sq. ft. of walk per day. From information furnished me by several of the leading contractors, each employing on an average of six gangs of men, a gang of six men will average only 600 sq. ft. per day for an entire season. This figure will be used as a basis for computing the cost of labor in the following table:

Cinders (allow for 20% shrinkage). 20.83 cu. yds. at 50 cts.	$10.42
Base 4¼ inches thick—Mix 1-2½-5:	
Cement, 9.77 bbls., at $1.20	$11.72
Sand, 3.47 cu. yds., at $1.75	6.07
Gravel, 6.85 cu. yds., at $1.50	10.28
Total	$28.07
Wearing coat ¾ in. thick—Mix 2-3.	
Cement, 5.56 bbls., at $1.20	$ 6.67
Sand, 1.17 cu. yds., at $1.75	2.04
Total	$ 8.71
Water at 1 mill per square foot	0.60
Labor, one gang one day	21.00
Use of tools, waste of material, etc., at 2%	1.37
Supt. and office exp. at 5%	3.51
Profit at 10%	7.36
Total	$81.04

The average cost per foot when 600 sq. ft. per day are laid divided into unit cost per sq. ft. is as follows:

Cinders	$0.0174
Base:	
Cement	$0.0195
Sand	.0101
Gravel	.0171
Total	$0.0468
Top:	
Cement	$0.0111
Sand	.0034
Total	$0.0145
Water	$0.0010
Labor	0.0350
Tools, waste, etc., 2%	0.0023
Supt., 5%	0.0058
Profit, 10%	0.0123
Total	$0.1351

In the above the cost of materials and water amounts to 7.97 cts. per sq. ft., which will remain constant, while the cost of labor, superintendent, etc., will vary according to the number of square feet laid per day per gang:

Av. sq. ft. per day	500	600	700	800
Cost of labor, supt., etc.	$0.1291	$0.1248	$0.1213	$0.1185

Report of State Engineers on the Progress of the New York State Barge Canal Work in 1909.

At the end of 1909 there are 314.2 miles of canal under contract at prices aggregating $54,138,329. Additional plans for 67.7 miles are completed, while the plans for 9 miles more are over 75 per cent finished and the plans for the remaining 20.5 miles are well under way. With some 22 miles of additional lake navigation, not included in this enumeration, a total of about 433 miles is reached, which is the whole length of the Erie, Oswego and Champlain branches of the Barge canal system, exclusive of the Niagara River, which is being improved by the federal government, and the Hudson River below Waterford, the improvement of which it is anticipated the government will undertake. Thus it will be seen that 76 per cent of the total length is under contract, and it is expected that the whole of it will be let by April 1, 1910, with the exception of some minor structures and operating machinery which it would not be advisable to put in place at this time, on account of expense of maintenance.

Fifteen of the 53 new locks are now completed, with the exception of gates and operating machinery, and in some of the structures these are now being installed. By a year from next spring the 8 movable dams in the Mohawk River will be in operation and will be used to aid in the dredging of the channel, by retaining water for the floating of dredging machinery. The large fixed dam across the Mohawk River near Crescent will be finished during next summer, as well also the concrete dam impounding the waters of the upper Mohawk at Delta in a reservoir having a flooded area of 2,860 acres.

At the close of 1909 the total value of all construction work equals $16,291,315. As the record to the end of 1908 was $8,701,323, it appears that nearly half of all the work done thus far has been performed during the past year. It should be noticed also that several contracts were let so late in the year that they have contributed but little to the record, complete plants not having yet been installed.

When compared by years, the excellence of this year's record is manifest. At the end of 1905 $330,120 had been expended; by the close of 1906 the total was $1,042,926, while the sum had reached $3,257,461 and $8,701,323 at the end of 1907 and 1908 respectively.

Of the 314 miles of canal under contract 120 miles, or 38 per cent, have been awarded during 1909. If the money value of these contracts is considered, the ratio is about the same. The total of contracts let during the year amounts to nearly $19,000,000, or more than one-third of the whole under contract.

It is a pleasure to state that the work of construction is being done within the original estimates. This is determined by comparing the contract prices with the estimate made in 1903, upon which the appropriation was based. With three-quarters of the work under contract, it seems assured that all the construction contemplated by the Barge canal act will be entirely completed within the original appropriation.

The 1903 estimate for construction on the portions of the canal now under contract amounted to $56,791,537, while the contract price for this work, as revised by alterations to date, is $54,138,329. This is a saving of $2,653,208.

Officials and engineers of the New Mexico Central R. R. were recently over the route of the proposed 100-mile extension from Torrance to Roswell, N. Mex. C. J. Landry, Contractor of Kansas City, Mo., accompanied the officials. W. S. Hopewell, Albuquerque, N. Mex., is president.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Some Construction Details and Costs of the Scioto River Storage Dam and Reservoir, Columbus Water-Works.*

The Scioto River Storage Dam is a concrete structure about 1,006 ft. long, consisting of two abutment sections, one on each bank of the river, with an overflow or rollway section between. The dam is of the curved or arched type, with the convex side up stream, the vertical up-stream face for a length of 810 ft. being built in plan to a radius of 800 ft. It was recommended that a 52-ft. dam, or so called high dam, be built—that is, a dam which would raise the water level 52 ft.—but owing to reasons purely local and having no relation to the design of the structure, the 30-ft. or low dam was built. The foundations and abutment sections, however, have been constructed so that at a future date the dam can be raised 22 ft. to the full height recommended. The crest of the present overflow is at Elevation 73.0, or 30 ft. above former mean low water, the abutment sections on either side rising to Elevation 95.0, or 22 ft. above the crest of the overflow. With the high dam, the crest of the future overflow will be at Elevation 95.0 and the top of the abutment section at Elevation 117.0. Although the dam is of the curved type, it has a gravity section, and in the design no consideration was given to the effect of any possible arch action.

The foundation on which the dam is built is Columbus limestone, the depth of the excavation being governed largely by the character of the rock. Under the overflow section, the rock was excavated to a depth sufficient to protect the foundation from the action of water moving at a high velocity, the rock here being hard and free from clay pockets; seams, however, are found at various angles. Under the west abutment, between Elevations 53.0 and 62.0, the rock was softer than that either above or below, and some large vertical cracks filled with clay and extending back into the hillside were found. The excavation therefore was carried to greater depths than was contemplated originally. The stratum of softer rock was also found on the east bank.

A cut-off trench, varying in depth from 3 to 5 ft. and about 5.5 ft. wide, was excavated under the up-stream portion of the dam. A part of the trench was excavated by a drill mounted on a horizontal bar, light charges of powder being used to loosen the rock, but satisfactory results were not obtained until an Ingersoll-Sergeant channeling machine was installed.

The dam was built mainly of concrete, but large stones were bedded in it to a certain extent, the percentage of such stones in the whole, however, being small. Lehigh Portland cement was used throughout the work and was furnished to the contractor by the city. The ballast for the concrete was crushed limestone screened into three sizes: No. 1, 0.25 to 0.75 in.; No. 2, 0.75 to 1.5 ins.; and No. 3, 1.5 to 3 ins.

During the fall of 1904, when about 6,300 cu. yds. of concrete were placed, the materials were mixed in the proportion of 1 volume of cement, 3 volumes of sand, and 2 volumes each of Nos. 1, 2, and 3 ballast. During 1905, when the remainder of the concrete was placed, the proportions were changed to 1 of cement, 2.71 of sand and 2.29 of each of the three grades of ballast. The two mixtures above mentioned were used in the main body of the dam. On the face of the present and future overflows and on the vertical sides of the abutment sections next to the present overflow for a depth of 1 ft. and on the top of the abutment sections for a depth of 6 ins. a richer mixture was used, the concrete containing 50 per cent more cement than that in the main body of the dam.

The total volume of concrete placed in the dam was 56,330 cu. yds., in which 56,870 bbls. of cement were used, giving a ratio of 1.01 bbls. of cement per cubic yard of concrete, and agreeing almost exactly with the specifications, which stated that "in general, not less than one barrel of cement will be used in each cubic yard of concrete."

The reservoir formed by the construction of the dam is peculiar in shape, as it is very long and narrow, the total length being about 5.8 miles and the mean surface width about 516 ft.; the maximum width is about 820 ft. and the minimum about 200 ft. The area of the water surface is about 363 acres and the mean depth about 14.5 ft.; the maximum depth, about 35 ft., is just above the dam. The total volume of water impounded by the present or 30-ft. dam up to Elevation 73.0 is 1,720,000 gals., of which 1.487,000,000 gals. are available, taking low water at Elevation 55.0. The total volume which would be impounded by the 52-ft. dam would be 5,681,000,000 gals., of which 5,448,000,000 gals. would be available.

Inasmuch as the water was to be purified by filtration, it was not considered necessary to strip the surface of the reservoir. All trees were cut down and all stumps and roots 1 in. or more in diameter were grubbed out to a depth of at least 1 ft. below the surface, after which the material was burned. The surface of the ground was then burned over. There were a few buildings on the site of the reservoir, one of which would have been submerged. Some of these buildings were moved to higher ground, the others were burned or torn down. One old bridge was removed and a new one, 540 ft. in length, was built to replace it. The new bridge was designed and erected under the direction of Mr. Walter Braun, county surveyor, the city paying 70 per cent of the cost. In addition to the above, about 3.9 miles of roads were relocated and constructed.

Table I gives the cost of the reservoir and dam and Table II gives the cost per million gallons of capacity. In order that the figures may be understood clearly, one or two items need explanation. In the reconstruction of the bridge and the approaches, as previously stated, the city bore 70 per cent of the cost, but the figures in Tables I and II give the total costs, and not the proportionate part paid by the city. Similarly the figures given for the cost of engineering include the cost of engineering chargeable to the bridge, although this work was not done under the direction of the city.

TABLE I—COST OF SCIOTO RIVER STORAGE RESERVOIR AND DAM.

Reservoir:	
Land, 452 acres at $334	$150,850
Clearing and grubbing 256 acres at $79.	20,200
Moving buildings	2,440
Reconstruction of roads, 3.9 miles at $12,670	49,400
Reconstruction of bridge	65,800
Conveyance deeds, 2 at $880	1,760
Keeper's house, repairs, and grading	1,760
Total cost of reservoir	$292,210
Dam:	
Excavation:	
Dry earth, 10,850 cu. yds. at $0.40	$ 4,240
Wet earth, 7,250 cu. yds. at $0.80	1,270
Rock, 29,000 cu. yds. at $1.40	41,870
	$53,480
Masonry and Steel.	
Concrete, 55,710 cu. yds. at $4.94	$275,340
Steel rails and splices, 28.7 tons at $35	1,009
Structural steel, 11,460 lbs. at $0.045	520
	$276,860
Gate Chamber:	
Concrete, 620 cu. yds. at $4.94	$ 3,060
Steel and cast iron, 18,430 lbs. at $0.045.	820
48-in. sluice gates, 2 at $600	1,200
36 by 60-in. sluice gates, 4 at $600	2,400
48-in. cast-iron pipe, 28.5 tons at $26.84	770
Screens, stop-planks and lifters	580
	$8,830
36-in. Sluice Pipes:	
Steel and cast iron, 5,270 lbs. at $0.042	$ 220
36-in. sluice gates, 6 at $263	1,580
36-in. cast iron pipe, 65.3 tons at $24.96.	1,630
	$3,430
Power tubes, 3	3,640
Railing, 1,000 lin. ft. at $1.75	1,750
Total cost of dam	$347,990
Summary:	
Reservoir	$292,210
Dam	347,990
	$640,200
Total cost of construction, exclusive of land	$489,350.
Engineering:	
Pay roll	$ 27,540
Supplies	3,560
Expenses	2,230
	$33,330
Percentage for engineering	$6.81

The item for engineering needs further explanation. Prior to 1904, when the engineering force was organized for carrying on the work of construction, and extending over a series of years during which the preliminary studies of the dam, the surveys of the reservoir and explorations of the dam site were made, no separate account was kept of the cost of engineering, it being included in the general engineering expenses of the city. After the writer became connected with the work, he made an attempt to ascertain this preliminary cost, but was unable to do so. The cost of engineering given in Tables 5 and 6 therefore does not include ths preliminary work, but does include the preparation of all the contract drawings and specifications, and the engineering expenses during the full period of construction.

TABLE II—COST, PER MILLION GALLONS. OF SCIOTO RIVER STORAGE RESERVOIR AND DAM.

Items.	Total cost.	Cost, per Million Gallons. Total capacity, 1,720,000,000 gal.	Available capacity, 1,487,000,000 gal.
Land	$150,850	$ 88	$101
Reservoir, exclusive of land	141,360	82	95
Dam	347,990	202	234
Total, exclusive of engineering	$640,200	$372	$430
Engineering	33,330	19	22
Total	$673,530	$391	$452

Unit Prices in 1909 in North Yakima, Wash.—During the year 1909 the city of North Yakima, Wash., of which Mr. H. J. Doolittle is City Engineer, made improvements, all work being done by contract, at the following prices:

	Av. unit price.
10,032 ft. 6-ft. wooden sidewalk	$0.40
51,610 ft. 8-in. vitrified pipe sewers	1.40
1,809 ft. 10-in. vitrified pipe sewers	1.74
2,525 ft. 24-in. concrete pipe sewers	1.89

The 24-in. sewer was an outfall extension, and was laid at an average depth of 4 ft. in gravel formation, no sheeting being required. The 8-in.. sewers were laid at an average depth of 8 ft. in gravel soil and sheeting was required almost continuously. The 10-in. sewers required sheeting and were laid 10 ft. deep in gravel. For the sewer work the prices above include the cost of manholes and flush tanks. Manholes were placed every block or 480 ft. apart. Since suitable sand and gravel was found on all contracts, concrete manholes were built, collapsible forms being used and very creditable results obtained.

*Abstract from a paper by John H. Gregory on the Improved Water and Sewerage Works of Columbus, Ohio. Proceedings American Society of Civil Engineers, Vol. xxxvi, No. 1, p. 2.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Cost of a Construction Service Telephone Line in Cuba*.

The following costs relate to a telephone line constructed in Cuba in 1908 during the building of the $800,000 water-works for the city of Camaguey. The line was constructed similar to the lines built by the U. S. Reclamation Service in the west for its irrigation projects. It was the intention to use the line to facilitate the construction of the pipe main and reservoir and on completion the telephone would serve as a permanent means of communication with the reservoir and pumping plant, the latter being located about 15 miles north of the city.

The labor consisted mostly of Spaniards, some Cubans and a few Jamaicans. The latter were used mostly in the pole raising gangs. One method of raising poles is shown in the accompanying engraving. As the poles were of hardwood, they were exceedingly heavy and on some sections of the line they were raised by means of a small gin-pole with block and tackle. The following description of the work is taken from the report made in the department at the time:

View Showing Method of Erecting Poles, Camaguey, Cube, Telephone Line.

The telephone line extends from a temporary station adjacent to the site where will be built the pump house for the Camaguey water-works to the office of the department of public works in Camaguey, a distance of about 25 kilometers or 15 miles. The portion of the line here considered comprises the main line, extending from the pump house site to station 1,040 of the pipe line, at which point the pipe line leaves the right of way and enters the road in the outskirts of the city, being a length of 20.934 km. It also includes two 4 wire branch lines, having an aggregate length of 0.283 km., which are considered, as required by the specifications, as equivalent to 0.566 km. of 2 wire line. The 4 wires on the branch lines are supported on hardwood cross arms, thus permitting the use of but one line of poles for each branch. From the pump house the line follows the right of way of the pipe line to a point about 15.7 km. distant, where it follows the public road for 1.1 km., again entering the right of way and following it to the above mentioned station 1,040.

The line is a two wire metallic circuit of No. 12 B. & S. gage hard drawn copper wire with a conductibility of 97 per cent, supported on oak brackets with glass insulators. The brackets are each nailed to the poles with two 6 in. galvanized iron cut nails.

The poles are of jiqui, arabo, tengue and jucaro prieto, all of which are durable hardwoods found in the country. A total of 131 jiuqui poles were shipped from Ciego de Avila, 60 miles west of Camaguey, by rail and delivered by sub-contract for $3 f. o. b. Camaguey. These poles were hauled from the cars and distributed along the line by mule teams, costing $6 per day with driver. The cost of $0.569 shown below was the actual cost per pole. A total of 333 poles were purchased from farmers living in the vinicity and were delivered along the line for $3 per pole. They were hauled on ox carts an average distance of about 10 miles.

The poles were spaced 46 ms. (161 ft.) apart except where road crossings required a 60 m. (197-ft.) span, or where angles in the line made it necessary to shorten the span. Guys of ⅝ in. steel cables were used to guy poles at angles in the line when the throw was more than 3 m. (10 ft.) and when the poles were not considered sufficiently firm. Short anchor posts 1.2 m. long were set in the ground 1 m. and the cable fastened by means of a threaded eye bolt passing through the post. The poles were 7.5 m. (25 ft.) long except at road crossings, where 9 m. (30 ft.) poles were used, and all were placed in the ground 1.5 m. (5 ft.) and thoroughly tamped in place, 3 men tamping to 1 shoveling. No poles whose least diameter was less than 5 ins. were used.

The holes for the poles were dug by subcontract, and as there was no foreman with the gang doing the original work, many holes were not dug in line and had to be redug. The majority of the holes were in hardpan and in earth filled with loose rock and boulders, a few being in rock requiring explosives, and some in earth. If the work had been done more rapidly and with a better organized gang it would have been possible to have reduced the labor charges by one-third.

The costs following are actual construction charges, covering all labor and materials necessary for the work as well as tools. They do not, however, include the contractor's charges for office expense, bond, insurance and other general expenses for the main contract. All prices are reduced to U. S. currency. The contract price for the work was $200 per km.

There were 464 holes dug for poles at the following costs:

Labor:	Total.	Per hole.
11 days superintendent at $150 per mo.	$ 55.00	$0.1185
6 days timekeeper at $2.31	13.86	0.0298
35 days foreman at $2.31	80.85	0.1742
1 day foreman at $1.50	1.50	0.0032
248½ days laborers at $1.15	285.77	0.6158
Total	$436.98	$0.9415

As there were 13.36 miles of line, the cost per mile of line for digging poles was $32.71.

The cost of squaring poles, roofing and painting roofs of poles was as follows:

Labor:	Total.	Per pole.
7 days superintendent at $150 per mo.	$ 35.00	$0.0728
8 days foreman at $2.31	18.48	0.0398
76½ days laborers at $1.15	87.98	0.1896
Total	$141.46	$0.3022
Materials:		
37 gals. paint and oil at $1.30	$ 48.10	$0.1040
Grand total	$189.56	$0.4062

The cost per mile of line was $10.59 for labor and $3.60 for materials, a total of $14.19.

The cost of setting poles was as follows:

Labor:	Total.	Per pole.
8 days superintendent at $150 per mo.	$ 40.00	$0.0859
3½ days timekeeper at $2.31	8.08	0.0174
7 days foreman at $2.31	16.17	0.0348
19 days foreman at $1.50	28.50	0.0614
220 days laborers at $1.15	253.00	0.5452
Total labor	$345.75	$0.7447
Materials:		
131 poles f. o. b. Camaguey at $3.	$393.00	
Hauling 131 poles at 56.9 cts.	74.56	
333 poles delivered on line at $3.	999.00	
Total	$1,466.56	$3.160
Grand total	$1,812.31	$3.9097

The cost of poles per mile of line was $25.88 for labor and $109.77 for materials or a total of $135.65.

The cost of stringing wire was as follows:

Labor:	Total.	Per mile.
2 days superintendent at $150 per mo.	$ 10.00	
18 days foreman at $1.50	27.00	
28½ days lineman at $2.25	64.12	
2 days lineman at $1.50	3.00	
86 days laborers at $1.15	98.90	
5 days mule cart at $1	5.00	
Total labor	$208.02	$15.57
Materials:		
2,965 lbs. No. 1 copper at 23.15 cts.	$686.40	
950 oak brackets at 4 cts.	38.00	
950 glass insulators at 7 cts.	66.50	
100 lbs. No. 6 galv. iron wire at 4 cts.	4.00	
250 lbs. cut nails at 5 cts.	12.50	
910 ft. steel cable guys at 1.51 cts.	13.74	
35 galv. iron clamps at 15 cts.	5.25	
35 iron eye-bolts at 10 cts.	3.50	
60 lbs. No. 14 soft copper wire at 23.15 cts.	13.89	
Total	$843.78	$63.16
Grand total		$78.73

The cost of tools was $38.26 or $2.86 per mile and general or camp expenses were $59.47 or $4.45 per mile. Summarizing the cost per mile of line was as follows:

Item:	Per mile.
Digging holes	$ 32.71
Squaring poles, etc.	14.19
Setting poles	135.65
Stringing wire	78.73
Tools	2.86
General	4.40
Total	$268.59

The work was done under the direct charge of Mr. E. K. Knight as resident engineer, with Mr. Henry A. Young as chief engineer.

*Rearranged from data furnished by Henry A. Young, late Chief Engineer, Camaguey Water Works, Cuba, 200 Warburton Ave., Yonkers, N. Y.

Contracts for Panama Canal Excavation.—Preparations are being made to let to contractors two pieces of excavation in the Panama Canal prism in the Gatun Lake region, one of about 166,000 cu. yds. near Bohio, and the other of about 36,000 cubic yards near Tabernilla. The tract near Bohio is on the west side of the Chagres river, and it was first intended to take it out by steam shovel, which would have involved the construction of a bridge across the river from the main line of the Panama railroad. A careful survey of the ridge that is to be cut down to elevation 40 feet above sea level, and a number of borings show that about 120,000 cubic yards of the material are earth, 42,000 cubic yards are soft rock, and 4,000 cubic yards are hard rock.

Is the Engineer School Necessary?*

A doubt having been expressed informally as to the usefulness of the engineer school or any service school, a few thoughts on the subject may not be amiss. This paper does not pretend to cover the whole question or to settle any part of it. It simply throws a few side lights on the matter.

When there is work of any kind to be done, it will be done best and most economically by a man who is properly equipped and trained for the purpose. This may be accepted as axiomatic; but to emphasize the point, as well as to determine what constitutes proper equipment and training, let us take a simple illustration.

You wish to have a set of shelves built in your office. You summon a carpenter, who comes and examines the contemplated job, gives you an estimate on it, goes and gets the necessary tools and material, and in a reasonable time completes the work. You find that your shelves present a neat appearance and show good workmanship. You are satisfied and pleased with the workman. You care nothing whatever about his ability as a mathematician, a writer, a theologian, or even an engineer. So far as your wants are concerned, he is a trained (that is, an educated) man.

A friend drops in and tells you that he wishes you to recommend a carpenter to build him a cupboard. You reply that you know a man who has just made a good job of a set of shelves. You have never seen him build a cupboard, but you feel sure that he has the necessary tools and skill to do so, and you confidently recommend him for the higher job.

Now this seems to be a very simple and sensible proceeding. There is nothing at all remarkable about it. Any one has sense enough to do the same thing. The same rule applies in all the walks of life. But does it? Do we select our trained men for the work of the army in this sensible way? Do we not proceed more as follows?

The carpenter arrives with nothing in his hands. We are astonished at this, and we ask if he has no hammer. He replies that it is in his tool chest, where it belongs. Dear, dear, it should be somewhere on his person. Has he no saws, no planes, no square, no screw driver, no chisels, etc.? He says that he has, but they are also in their proper places in the tool chest. We are grieved at this and fear that he is not properly equipped for the work in hand. Then, too, a friend of ours intends to build a cupboard which will involve the use of beading and molding. Has the carpenter the special tools for this? Has he a mortising machine? Why, no, certainly not. If he fills his chest with tools which are of infrequent use, he only makes it the more difficult to get at the more important tools in the chest; and besides it is more economical to have such work done at the mill. We fear that we cannot employ him, as he is not provided with all the tools required to meet possible needs. In vain he points out that when special cases arise he has sense and knowledge enough to go and buy the proper tools, and that if he were to carry upon his person all kinds of tools used in his business he would only crush himself to the earth and be unable to perform any work at all. But no, he is not fully equipped. We can not accept him.

This may appear to be overdrawn, but it is a close parallel to what is done in the army. Not two years ago the writer was ordered to report to a board for examination to determine his fitness for promotion. He began at once to prepare for the ordeal. How did he go to work? By inviting attention to the shelves he had built? Not at all. He made lists of all the tools which the board in similar cases had insisted should be carried upon the persons of all carpenters who aspired to the construction of cupboards, and he proceeded to attach them to himself for the inspection of the board. (Observe, please, that facts and knowledge are the tools of the engineer, just as woodworking implements are the tools of the carpenter.) Many tools fell off daily, but he hastily hung them on again, until on the appointed day he presented himself for inspection with the most absurd, ridiculous, and preposterous assortment of tools imaginable heaped upon him and dangling from all his parts.

Owing to distance, the board could not inspect him in person, but prepared a list of tools which he was to exhibit and describe under the direction of a designated officer, and which were to be accepted as representing the whole museum. (In other words, the examination was written.) For ten long weary days he exhibited and described the tools demanded. They formed but a small part of the collection that he had assembled and under whose weight he was barely able to stagger and entirely unable to work. At last the exhibition was over. The board solemnly pronounced him properly equipped to build cupboards. As a matter of fact he could not have built a cupboard then to save him. The load he had borne was too great and the exhaustion too severe. He threw away his burden, confident that most of it would never again be needed and that the rest could be picked up again when desired; but it was several weeks before he had recovered sufficiently to build as good a cupboard as he could have built before he overtaxed his back. There is nothing unusual about this case. It is perfectly typical.

Right here is the proper place for the reader to ask how it is possible then to be sure that a man has the proper education for his position. How can a military engineer be trained if he does not acquire all the tools of his profession and keep them always at hand?

To answer this question, let us again consider the carpenter. How did he acquire the skill which enabled him to make a good job of the shelves? Without doubt he began work in his youth under the guidance of an older and more experienced man. By seeing how his preceptor performed his work, he learned to do likewise. He also learned by experience just what tools it was best to keep always available in his tool chest, and how to keep them in the best condition for use. His tools were always a means to an end, never the end itself. Being a man of character and ambitious, he applied his inventive faculty to improving upon the methods of his teacher, and he naturally became interested in the ideas of others upon his trade. He was familiar with the various special tools which he saw in the hardware store or illustrated in catalogues, and he knew where to obtain such tools in case of need. There could be no question as to his ability to use them, for the knack of using tools is not confined to those alone which are most frequently used. He thus trained himself to perform not only those works which were of daily occurrence but also those which demanded resourcefulness. The moral is that the ability to do work is acquired by doing it, and doing simple work stimulates the worker and assists him to advance to higher undertakings. No amount of study and theory will produce this result.

Were it possible to take those graduates of the Military Academy who are assigned to the corps of engineers and place them at once under the care of older officers on works where they could see how the tools of the profession should be used and where they could themselves acquire the use of those tools, or were it possible to assign them to companies under experienced captains where they could acquire all the tools of the military branch of their profession, this would produce more efficient officers for both military and civil engineering duties than any amount of instruction in the best equipped school.

Again the reader bobs up with an inquiry as to why this is not done. Why equip and maintain an expensive engineer school if it is not the best way to train our officers?

The answer is prompt. It is the best way available. We are actually sending the young officers to duty under experienced men, but a year is about the longest time that can be spared, and is too short. We have too few officers to assign the young ones for several years to works already properly administered by older men. In many cases the young and inexperienced must control without the guidance of the experienced. Under present conditions our captains are themselves inexperienced and but little older than their lieutenants. That they acquit themselves as well as they do is highly creditable to them, but they are not old enough to undertake the training of young officers, and the system falls to the ground.

Let us suppose that our young carpenter finds himself at the outset called to a place far removed from the experienced man who was to have trained him. What can the latter do to increase the young man's chances of success? He would probably assist him to select an assortment of those tools which he should always have in his kit, at the same time giving such advice as to their use as the time would permit, and he would give him a catalogue of special tools which he could order later if necessary. This instruction would be very different from the full training which was to have been given, but the young man would go out into the world much better equipped than if he had been left entirely to his own resources. If he is the right kind he will succeed anywhere, but starting him on the right road makes his success easier and more certain.

The function of the engineer school should be exactly similar. The burden of the corps of engineers are steadily increasing, while the time available for the preliminary training of young officers is as steadily decreasing. A few years ago it was three years and it was then rarely broken into. Now it is only two years, and the students are assigned to all kinds of duties that interfere with their school work or interrupt it entirely. Today a young officer is apt, nay quite sure, to be entrusted with important duties. If he knows what tools to use he will be less apt to make mistakes. If he is the right kind, and most of them are, he will make good anyway; but he will succeed more surely and with less effort if he is given a proper start like the young carpenter. Mistakes in modern engineering are very costly, and good sense demands that every possible precaution be taken against them. If allowed to perform its proper function, the engineer school is of the highest value and practically indispensable.

The great danger to this school and to the army is thought to be the tendency toward the belief that the education of the army is in itself an important thing, whereas it is really of no importance whatever except in so far as it enables the army to do its work better, and that keeping the army always at school is the same thing as educating it. At the engineer school we should give to the student officer the kit of tools which he will need for every day use, show and explain the more intricate tools which he may have to use in special circumstances and tell him how to get these special tools, and then send him out into the life of the service to make good through his own character and energy. The business of life is work and accomplishment. A certain amount of preparation is wise and necessary; too much is a waste. A man could spend his whole life in the endeavor to learn everything bearing upon his profession and at the end of that life find that his object had failed and that he had accomplished nothing useful. Not only is this true, but after a certain amount of preparation the power to use the acquired knowledge is lost. Just as the carpenter who attempts to carry his kit all the time can do little work under such a burden, so the professional man can overload his brain so that it can not work. The musician who practises too much may becomes paralyzed. The athlete who trains too much may become stale. The student who attempts to learn too much may injure his mind. The same rule holds true in everything.

The whole army is now at school to the great detriment of its proper work. If every man is able to do his work and does it, what more can be asked? Why is it necessary that every private shall be trained to be an officer and every officer a general? What can be more appropriate than that every captain shall be engaged in training his company or troop and preparing it for service? This is a work that demands all the intelligence, energy, and time of an able man. How many captains are

*From a paper by R. R. Raymond, Instructor in Civil Engineering at the Engineer School, Washington Barracks, D. C., in "Professional Memoirs" of the Engineer Bureau, U. S. A.

permitted to do it, however? Are they not rather preparing themselves to be generals? What is wrong with the army? This is the oft repeated cry. The answer comes: There is nothing wrong with the army; it was never more efficient than at present. This sounds well, but it is not true. There is something wrong. Every one feels it, this spirit of unrest. The trouble is that we are staggering under our kit of tools and are not doing our work. What is worse, we are losing the power to do it. Would it not be wiser to take the army out of the perpetual school, put it on its own job without distraction, let it learn to use its tools through use and not by holding them up for inspection? Only then will it be a happy and contented army and a truly educated and efficient one.

Under no circumstances should a company officer be taken away from his company nor should he be nagged by any school or duties not directly connected with his command Every particle of his energy is needed to instruct and care for his men. This is the highest and most important duty of a captain. It is recognized in the army regulations, but is not in practice accorded its real weight. When the company goes into the field, which is the more important, that the captain shall be qualified to command the regiment (theoretically) or that the company shall do its work? If the captain spends two or three years detached from his command, listens to lectures, rides over historic battle fields, exhausts his energies in study, and learns to think himself It, how doth it profit the company? How many companies and troops are today captainless while their captains are at school?

Should we abolish the schools then? Not at all. They are very valuable if kept in their proper places, but it should never be forgotten that they are a means only. They are of absolutely no importance in themselves. A few officers can well be employed in recording, compiling, and publishing the advances in military sciences, but it will rarely be the case that any advance comes from an officer on duty at a school. This is not his fault; his brain has no opportunity for original work. The most certain way to prevent a man from inventing anything useful is to keep him busy with matters other than the problem in hand.

These observations apply to all arms of the service, but just now we are especially concerned with their application to the corps of engineers. We need trained officers. To train them we must occupy them with their own work and as little else as possible. Experience is by far the best of all teachers, but unfortunately we are expected to be trained in a field that is broader than any one man's experience can possibly be. The engineer school comes to our rescue here, but to be of real value it should give each man his outfit of knowledge and send him out to real life in the least practicable time. He needs a working equipment and not an encyclopædic education. To give him this equipment quickly so as to secure to the government the benefit of his useful services, the school should have every facility. Its instructors should be allowed to perform their functions without other duties. This is now provided for on paper, but the powers that be respect it not at all.

The school should have adequate buildings where the laboratories, model rooms, and library could be worked to their utmost capacity. An hour in a model room, such as we could have at the engineer school, is worth weeks of hard reading. With half a show we could have a school that would really fit our young officers for their life work. Under present conditions it may be doubted whether the results justify the effort. Both instructors and students are overloaded with extraneous duties or whisked away entirely for all kinds of jobs. The classes are not permitted to progress together throughout the course, but are broken up so that the members graduate months (sometimes years) apart. The engineer troops are sacrificed by taking their officers away to attend the school, and then the school is disabled by sending its instructors and students to duty with the troops. We are trying to serve two masters, each of whom independently expects to have all our time and energy.

The engineer troops are a vitally important part of the army. They should have their full complement of officers and every opportunity to perfect themselves in their own sphere of action. Nothing should be permitted to interfere with their training or the discharge of their proper functions. They should be supplied with officers regardless of other demands upon the corps of engineers. Other duties, civil duties, duties of high importance, have been assigned to the corps in order to make it possible to maintain a body of trained engineers for use in war. These duties afford a training which is of the greatest value, and the efficiency of the corps would be seriously affected if we were to be separated from them, for that would amount to taking us away from work and sending us back to school to keep us busy. It is manifest that in time of peace the military engineer can not find real employment for his profession, and it is equally clear that practice as a civil engineer is excellent training for the doing of any kind of engineering work. On the other hand, the school is of real importance and should receive its just consideration and dues.

The problem in a nutshell is this: Given a certain number of officers in a corps of engineers, is it possible by separating some of them from the proper work of the corps and placing them in a school, to improve the efficiency of the corps as a whole, so that the amount of work accomplished is increased or its quality bettered?

The writer believes that it is practicable and advantageous to do this. If this belief is correct, then there must be some definite relation between the corps and the school, which should fix the proportion of the corps to be employed at the school to give the maximum efficiency. If no officers go to the school, all will be available for work. If one man can be employed at the school in collecting, compiling, and publishing professional information, so that through such information the corps is enabled to accomplish more than it could do without the informatnon, but with that officer in his normal place, then the school is useful. If two men at the school can secure a still greater efficiency of the corps, then the school should be increased to two, and so on. After the proper number of officers to collect and dispense knowledge has been determined, a further problem arises. Can the efficiency of the corps be further increased by sending a number of officers as students to the school for a time? If so, how many should go, and for what time?

Great wisdom than the writer's is needed to answer these questions, but it is safe to say that the shorter the time necessary to impart the desired education the better for the work of the corps, and this time can be shortened for a given standard of education only by means of the best equipment and other facilities and by rigidly enforcing the principle of non-interference with the school by other interests.

Dump Cars at Panama.—One hundred all steel, side door dump cars of a rated capacity of 12 cu. yds. will be added to the equipment on the relocation of the Panama railroad. The Washington office has been directed to advertise for bids. The cars will be of about the same construction as the 300 added to the service during the year 1909, and will embody all the improvements suggested by the hard usage that dump cars have been subjected to on the Canal work. The first lot of the 12-yd. dump cars were put in service in 1905, when 100 were added to the equipment. The following year 300 were in the service; in 1908, there were 800, and in 1909 there were added 300 more. In addition to these 12-yd. cars there are 300 steel dump cars of a rated capacity of 25 cubic yards in service, and 250 more of this size are being advertised for in the states. When all the cars on order are added to those in the service there will be 1,200 steel, side door dump, 12-yd. cars, and 550 steel, side door dump, 25-yd. cars available, in addition to 1,765 wooden flat cars, and 500 steel flat cars in use on the work.

Methods and Cost of Constructing a Concrete Lock and Timber Crib Dam With Appurtenant Structures Employing Day Labor.

II.

The work consisted in constructing a timber crib dam across steam with a lock at one end for the passing of boats. Methods and costs of constructing the lock and the guide cribs to the lock were given in our issue of Jan. 26. In this issue we conclude with a discription of the dam, giving detailed costs.

DAM ABUTMENT.

The dam was connected to the shore by a concrete abutment. This abutment was T-shaped, the stem of the T running into the bank, and was founded on piles driven to bed rock. It is surrounded by triple-lap sheet piling. The concrete was deposited in shallow water from 1 in. to 18 ins. deep by skips, the main piles being embedded about 4 ft. in the concrete. The river face is 14 ft. long on top and 76 ft. long at the base. The land arm which enters the bank for its entire length is 60 ft. long. The abutment was built to the same height as the lock walls, namely, 10 ft. above the crest of the dam. At the land end of the abutment stem the natural surface of the ground is at the same level as the top of the abutment, but begins there to slope downward and drops 21 ft. in a distance of 125 ft. This slough immediately in the rear of the low narrow ridge to which the abutment is anchored is closed by a crib dam 250 ft. long, forming a timber extension to the abutment. A mattress of 15-in. fascines is placed below this extension and is covered with a 2-ft. layer of heavy stone. The concrete for the abutment was machine mixed in the following proportions: In the foundation, 1 bbl. of cement, 9 cu. ft. of sand, 8 cu. ft. of crushed stone and 16 cu. ft. of gravel; above the foundation, 1 bbl. of cement, 5 cu. ft. of sand and 27 cu. ft. of gravel. The top of the abutment was faced with a 1:2 mortar, no facing being used elsewhere. The timber extension, which consists of a double row of 10x10-ft. cribs for the middle 140 ft., and a single row at either end, is of the same height as the abutment, is founded on piles driven to bed rock, is sheeted to the top on its upper face, is filled with rubble, and is backfilled for 50 ft. with earth at a slope of 1½ on 1 covered with a paving of loose riprap. The main bank is revetted to its top for 50 ft. above and 100 ft. below the crib extension. Below the abutment only a sheet-pile revetment was originally provided for, but it was directed that a protection crib 150 ft. long be built instead.

Summarized, the work comprised first the construction of the crib dam at the rear of the abutment; second the construction of the abutment proper, and third the construction of an abutment protection crib. The crib dam and abutment were first completed to original plans and afterwards were increased in height 4 ft.; in the following, therefore, the original construction costs are first given complete and then the cost of the additional work.

Preparation of Site.—For the site of the dam and abutment 3.3 acres were purchased and cleared at the following cost:

Item.	Total.
3.3 acres purchased at $40	$132
3.3 acres cleared at $41.51	137
Total at $81.51	$269

Excavation.—The excavation amounted to 6,496 cu. yds., and cost as follows:

Item.	Total.	Per Cu. Yd.
Fuel	$ 25	
Excavation by hand and teams	1,150	
Excavation by dredge	378	
Total	$1,553	$0.239

Foundation.—The foundation work comprised the driving of 4,399 lin. ft. of piling and cost as follows:

Materials.	Total.	Per Lin. Ft.
4,388 lin. ft. piles	$440	$0.100
Fuel	13	0.003
Miscellaneous	47	0.017
Total materials	500	$0.120

Labor.		
420⅝ days' labor driving....	$747	$0.169
Grand total.....	$1,247	$0.289

Sheet Piling.—The cost of 58,263 ft. B. M. of sheet piling was as follows:

Materials.	Total.	Per M. ft.
58,263 M. ft. lumber.....	$708	$12.15
2,400 lbs. spikes at 2.84 cts.....	68	1.17
Fuel	4	0.06
Miscellaneous	8	0.13
Total materials	$788	$13.51
Labor.		
46 days towing lumber (58,263 M. ft.)	$ 115	$ 1.97
136 days handling and storing (58,263 M. ft.).....	253	4.35
11 days inspecting (58,263 M. ft.)	30	0.51
523⅜ days driving (58,268 M. ft.)	1,034	17.75
Total labor	$1,432	$24.58
Grand total	$2,220	$38.09

Crib Dam.—The crib dam was 250 ft. long and contained 115.777 M. ft. of lumber and 2,170 cu. yds. of riprap filling. The cost of the timber work was as follows:

Materials.	Total	Per M. ft.
115,777 M. ft. timber.....	$1,521	$13.13
Unloading timber	12	0.10
3,875 lbs. bolts at 2.41 cts.....	94	0.081
Total materials	$1,627	$14.04
Labor.		
73 days towing (90,721 M. ft. at $1.97)	$ 179	$ 1.55
212½ dys. handling and storing (90,721 M. ft. at $4.35).....	394	2.54
18 dys. inspecting timber.....	52	0.44
515 dys. building crib (115,777 M. ft.)	911	7.85
Total labor	$1,536	$12.38
Total labor and materials..	$3,163	$26.42
Add. miscellaneous	75	0.64
Grand total	$3,238	$27.06

The cost of the riprap filling, 2,170 cu. yds., was as follows:

Item.	Total	Per cu.yd.
2,170 cu. yds. rip rap.....	$1,584	$ 0.70
28 dys. inspecting 1,708 cu. yds. at 3 cts.....	45	0.02
172¾ days piling 2,170 cu. yds..	301	0.14
Total rip rap.....	$1,930	$ 0.89
Grand total for crib.....	$5,168	

The total cost of the crib per lineal foot was:

Item.	Total	Per lin. ft.
Crib construction	$3,238	$14.55
Rip rap fill.....	1,930	7.72
Total	$5,168	$22.27

Concrete Abutment.—The T-abutment contained 765 cu. yds. of concrete. The cost of the 757 bbls. of cement for this concrete was as follows:

Item.	Total	Per bbl.
757 bbls. cement	$1,461	$1.93
Inspecting cement	20	0.02
Loading on barges.....	30	0.04
Towing to dock.....	79	0.11
Unloading and storing.....	66	0.08
Total for 757 bbls.....	$1,656	$2.18

The cost of 25 cu. yds. of crushed stone was as follows:

Item.	Total	Per Cu. Yd.
Loading 24 cu. yds	$ 41	$1.56
Towing	29	1.13
Total for 26 cu. yds	$ 70	$2.69

The cost of 127 cu. yds. of sand was as follows:

Item.	Total	Per Cu. Yd.
127 cu. yds. sand	$121	$0.95
Loading 48 cu. yds. at 65 cts....	32	0.25
Towing 48 cu. yds. at 61 cts....	29	0.23
Inspecting 127 cu. yds.....	11	0.08
Total for 127 cu. yds.....	$193	$1.51

The cost of 720 cu. yds. of gravel was as follows:

Item.	Total	Per Cu. Yd.
25⅝ dys. labor	$ 57	$0.08
Fuel for dredge.....	68	0.09
Total for 720 cu. yds.....	$125	$0.17

The cost of mixing and placing 765 cu. yds. of concrete was as follows:

Item.	Total	Per Cu. Yd.
Cons. and removing forms.....	$ 59	$0.077
587 2-3 dys. mixing and placing	1,055	1.379
Fuel for mixing and placing....	24	0.031
Tamping	213	0.278
Finishing	4	0.005
Total for 765 cu. yds.....	$1,355	$1.770

Included in the total cost were the following miscellaneous items:

Item.	Total	Per Cu. Yd.
Miscellaneous materials .....$	14	
Erecting derrick	208	
Removing plant	62	
Total for 765 cu. yds.....	$ 284	$0.37

Summarizing we have the following cost per cubic yard of concrete:

Item.	Total	Per Cu. Yd.
757 bbls. cement at $2.18.....	$1,656	$2.19
26 cu yds. crushed stone at $2.69	70	0.09
127 cu. yds. sand at $1.51.....	193	0.25
720 cu. yds. gravel at $0.17.....	125	0.17
Mixing and placing 756 cu. yds. conc.	1,355	1.77
Miscellaneous charges	284	0.37
Total for 765 cu. yds.....	$3,683	$4.84

The grading and backfill about the abutment amounted to 4,183 cu. yds. and cost $1,299 or 31 cts. per cu. yd.

Protection Mat.—Below the crib dam there was constructed a protection mat of brush fascines covered with rip rap. There were 66 squares of mattress and 368 cu. yds. of rip rap. The cost of the mattress proper was as follows:

Item.	Total	Per Square
12 dys. labor burning brush..... $	29	$0.44
2,255 lbs. wire at 3.2 cts.....	72	1.09
104¼ dys. making and loading fascines	210	3.27
52½ dys. laying mattress.....	95	1.44
Total for 66 squares.....	$406	$6.24

The cost of the 368 cu. yds. of rip rap covering was as follows:

Item.	Total	Per Cu. Yd.
368 cu. yds. rip rap stone.....	$269	$0.73
6 dys. labor inspecting stone...	9	0.03
41½ dys. paving mattress.....	77	0.21
Total for 368 cu. yds.....	$355	$0.97

The total cost of the mattress per square was therefore as follows:

Item.	Total	Per Square
Fascine mattress in place	$496	$ 6.24
Paving with rip rap.....	355	5.39
Total for 66 squares.....	$761	$11.61

Bank Revetment.—The banks above and below the abutment were riprapped; the cost of 1,523 cu. yds. was as follows:

Item.	Total	Per Cu. Yd.
1,523 cu. yds. rip rap stone....	$1,112	$0.73
38 dys. inspecting rip rap.....	65	0.05
296 dys. placing rip rap.....	578	0.37
Total labor 1,522 cu. yds....	$ 643	$0.42
Grand total	$1,755	$1.15

The total cost of the original dam and abutment was from the above items $17,951. The cost of raising both dam and concrete about 4 ft. is given as follows:

The raising of the old dam 4 ft. for a length of 250 ft. involved taking up and relaying 2,200 sq. yds. of rip rap, placing 3,180 cu. yds. of earth backfill and 1,131 cu. yds. of new rip rap paving, building 110 squares of mattress, building 4x10x280 ft. of crib and filling in 332 cu. yds. of rip rap. As many of the labor items are not separated, we give only a summary, as follows:

Item.	Total	Per Lin. Ft.
Materials	$1,072	$ 3.83
Labor	3,409	12.17
Total	$4,481	$16.00

The raising of the abutment 4 ft. involved 35 cu. yds. of concrete work, which cost as follows:

Item.	Total.	Per Cu. Yd.
45 bbls. cement at $2.25	$101	$2.89
114 dys. mixing and placing....	216	6.17
Total for 35 cu. yds.....	$317	$9.06

The labor cost given includes forms, obtaining concrete materials, etc.

Placing Derrick Stone.—To protect the foot of the crib dam and the base of the abutment, 1,111 cu. yds. of derrick stone were placed at the following cost for quarrying, towing and placing:

Item.	Total	Per Cu. Yd.
Fuel ..... $	95	
842 cu. yds stone (royalty 3 cts per cu. yd.).....	25	
269 cu. yds. stone (no charge)..	....	
1,959⅜ dys. labor for 1,111 cu. yds.	3,623	
Total for 1,111 cu. yds.....	$3,743	$3.37

Abutment Protection Crib.—To protect the abutment a timber protection crib was built along the river bank above the abutment. The work involved 5,500 cu. yds. of excavation, 37.934 M. ft. of timber crib work and 831 cu. yds. of stone filling, besides grading and paving the brick behind the crib.

The cost of 5,500 cu. yds. of excavation by teams and orange peel was as follows:

Material.	Total	Per Cu. Yd.
Fuel ..... $	148	$0.027
Labor.		
200⅛ days erecting and maint. trolley way	402	$0.071
45 dys. pumping pit.....	87	0.016
1,352⅝ dys. excavating.....	2,676	0.488
Total labor	$3,165	$0.575
Grand total	$3,313	$0.602

The cost of 37.934 M. ft. of crib work was as follows:

Materials	Total.	Per M. Ft.
34.667 M. ft. timber at $11.21.....	$389	$10.25
3,236 M. ft. old timber at $5.....	16	0.42
1,050 lbs. iron at 2.2 cts.....	23	0.66
Miscellaneous materials	18	0.47
Total materials, 37.934 M. ft...	$446	$11.80
Labor.		
48 dys. hand and struct., 34.667 M. ft. at $2.63.....	$ 91	$ 2.39
269 dys. framing and placing 34.667 M. ft. at $14.79.....	513	13.52
Total labor, 37.934 M. ft.....	$ 604	$15.91
Grand total	1,050	27.71

The cost of 831 cu. yds. of stone filling placed in the crib was as follows:

Item.	Total.	Per Cu. Yd.
831 cu. yds. stone.....	$ 607	$0.73
13 dys. inspecting stone.....	25	0.03
276⅝ dys. filling stone into crib...	527	0.63
Total	$1,159	$1.39

The cost of grading and placing 539 cu. yds. of rip rap paving behind the crib was as follows:

Item.	Total.	Per Cu. Yd.
539 cu. yds. rip rap.....	$ 393	$0.73
8 dys. inspecting rip rap.....	16	0.03
335⅛ dys. grading and paving..	624	1.16
Total for 539 cu. yds.....	$1,033	$1.92

The grand total of the above items of work on abutment and abutment crib dam is $33,033.

DAM.

The dam crossing the river is 658 ft. long, 250 ft. of which is founded on piles and 408 ft. on rock. A level stratum of bed rock stretches across the river; near the lock this rock is covered with large boulders and beyond these with a layer of gravel. The portion of the dam on piles is over this gravel. As built, the section of the dam on piles is protected by rows of sheet piling along the upstream and along the downstream edges of the dam and also by a third interior row along the upstream edge of the apron. The upper row of water-tight sheet piling is, of course, necessary; the two lower rows were introduced to serve as guards to keep the reflex eddy below the dam from washing out the gravel around the piles, but being water tight are subject to a hydrostatic head from any leakage that enters the body of the dam. A better construction would have been a single row of close piles just above the downstream edge, which while acting as a guard would yet have allowed any leakage to escape without compelling it to rise above the piling.

Dam on Pile Foundation.—In constructing the dam the 250-ft. section on pile foundation was first built as a step dam and then changed from step dam to slope dam. The cost of the original structure will first be given and then the cost of changing it to slope dam.

To prepare the foundation for pile driving the gravel was first dredged out to 3 ft. below lower pool level. The excavation amounted to 8,097 cu. yds. and cost as follows:

Item.	Total.	Per Cu. Yd.
Fuel and oil	$ 90	$0.011
98¼ dys. labor on dredge and teams	218	0.027
Total for 8,097 cu. yds.	$308	$0.038

A total of 278 piles or 6,968 lin. ft. of piling was driven for the foundations to an average penetration of 14 ft. The cost of this pile foundation was as follows:

Item.	Total.	Per Lin. Ft.
6,968 lin. ft. piling	$ 697	$0.100
Fuel and oil	38	0.005
332 dys. labor driving	646	0.092
Total for 6,968 lin. ft.	$1,381	$0.197

This cost does not include cutting off piles, which is charged to timber work. The cost per pile in place was nearly $5.

There were 108.977 M. ft. of sheet piling driven, at the following cost:

Materials.	Total.	Per M. Ft.
42.712 M. ft. pine at $13.96	$ 596	
57.260 M. ft. oak at $19.42	1,113	
Total for 108.977*	$1,709	$15.68
4,561 lbs. iron, nails and bolts at 3.16 cts	144	1.33
Fuel	177	1.63
Total materials for 108.977 M. ft.	$2,030	$18.64
Labor.		
153 dys. handling and stacking, 108.977 M. ft.	$ 290	$ 2.66
943⅜ dys. driving, 108.977 M. ft.	1,820	16.70
Total for 108.977 M. ft.	$2,110	$19.36
Grand total	$4,140	$38.00

*Includes 9.005 M. ft. of old lumber for which no charge was made.

Assuming the 9.0055 M. ft. not charged for to cost $15 per M. ft. for old lumber, the cost per M. ft. in place would be $39.24 instead of $38. There were 667 sheet piles driven, so that the cost per pile was $3.16.

The construction of the crib work required 172.055 M. ft. B. M. of timber and cost as follows:

Material.	Total.	Per M. Ft.
113.065 M. ft. pine at $14.17	$1,602	
58.990 M. ft. oak at $14.48	855	
172.055 crib timber	$2,457	$14.28
12,316 lbs. spikes, iron, etc., at 2.54 cts.	339	1.97
Total for 172.055 M. ft.	$2,796	$16.25
Labor.		
241 dys. handling and stacking 172.055 M. ft.	$ 714	$ 2.65
1,366 dys. framing and placing 172.055 M. ft.	2,705	15.72
Total for 172.055 M. ft.	$3,419	$18.37
Grand total	$5,589	$34.62

The crib work was filled with 3,707 cu. yds. of rip rap stone at the following cost:

Item.	Total.	Per Cu. Yd.
3,707 cu. yds. stone	$2,706	$0.73
53⅜ dys. labor filling in stone	299	0.08
Total for 3,707 cu. yds.	$3,005	$0.81

The grading and paving above the dam comprised 1,600 cu. yds. of earth fill, 80.5 squares of brush mattress and 283 cu. yds. of rip rapping over the mattress. The cost of this work was as follows:

Earth Fill and Paving.	Total.	Cu. Yd.
283 cu. yds. rip rap	$198	$0.70
4 dys. inspecting rip rap	8	0.03
228¾ dys. filling 1,600 cu. yds., and paving 283 cu. yds.	505	
Total	$711	
Mattress Construction.	**Total.**	**Per Sq.**
400 lbs. wire at 2.5 cts.	$ 10	$0.124
67½ dys. obtaining brush and laying neat	125	1.540
Total for 80.5 squares	$135	$1.664

The protection below the dam comprised 87.5 squares of brush mattress paved with 76 cu. yds. of rip rap, and of a fill of 830 cu. yds. of derrick stone. The cost of the work was as follows:

Excavation (3,407 cu. yds.)	Total.	Per Cu. Yd.
42½ dys. dredge labor	$ 96	$0.028
35⅝ dys. teams grading	83	0.024
Total	$179	$0.052
Brush Mattress (87.5 squares).	**Total.**	**Per Sq.**
400 lbs. wire at 2.5 cts.	$ 10	$0.114
76 cu. yds. rip rap at $0.72	55	0.628
1 dy. inspecting rip rap	2	0.002
320⅜ dys. building mattress	857	9.790
Total	$924	$10.534

Derrick Stone Fill (830 cu. yds.).	Total.	Per Cu. Yd.
Dynamite, pure, etc.	$ 78	$0.094
Fuel	74	0.089
1,028⅜ dys. labor	1,991	2.398
Total for 830 cu. yds.	$2,143	$2.581

The changing of the step dam to slope dam cost as follows:

Item.	Total.	Per Unit.
88,171 M. ft. B. M. cribwork	$1,333	$15.12
429 cu. yds. rip rap filling	$ 371	$ 0.86
250 lin. ft. of dam	$3,124	$12.49

The total cost of the crib dam from the above figures was $86.96 per lin. ft.

Dam on Rock.—There were 408 lin. ft. of crib dam constructed on rock foundation.

To prepare the foundation rock for the crib work 6,733 cu. yds. of excavation were required and it cost as follows:

Item.	Total.	Per Cu. Yd.
Fuel for dredge	$278	$0.041
Labor dredging earth and boulders	694	0.103
Total for 6,733 cu. yds.	$972	$0.144

The construction of 849,409 M. ft. of crib work cost as follows:

Materials.	Total.	Per M. Ft.
618,036 M. ft. pine at $12.66	$7,828	$ 9.20
231,374 M. ft. oak at $16.73	3,872	4.55
58,984 lbs. iron, spikes, etc., at 2.19 cts.	1,293	1.52
Fuel	416	0.49
Miscellaneous	121	0.14
Total for 849,409 M. ft.	$13,530	$16.40
Labor (849,409 M. ft.).		
1,188 dys. unloading and stacking timber	$2,256	$ 2.65
3,530 dys. framing and placing timber	6,742	7.94
30 dys. clearing up yard	58	0.07
Total labor	$9,056	$10.66
Grand total	$22,586	$27.06

The cost of filling the crib with 12,992 cu. yds. of rip rap was as follows:

Item.	Total.	Per Cu. Yd.
12,992 cu. yds. rip rap	$8,437	$0.650
Fuel	268	0.020
15 dys. building wagon roads	25	0.002
147 dys. inspecting 9,863 cu. yds. at 3 cts.	287	0.021
104⅜ dys. towing 1¼ m., 3,129 cu. yds. at 7 cts.	233	0.017
3,813⅜ dys. filling 12,992 cu. yds.	7,139	0.550
Total	$16,389	$1.260

The cost of 1,939 cu. yds. of additional gravel filling was as follows:

Item.	Total.	Per Cu. Yd.
Fuel	$ 21	$0.01
517½ dys. dredging, towing ¼ m., and placing	971	0.50
Total for 1,939 cu. yds.	$992	$0.51

The cost of 13,054 cu. yds. of gravel backfill and of 529 cu. yds. of rip rap paving was as follows:

Gravel Backfill.	Total.	Per Cu. Yd.
Fuel	$ 404	
792 gals. coal oil	126	
Material for dump cars	248	
764⅜ dys. dredging, towing ¼ m. and placing	1,533	$0.12
Total	$2,311	$0.177
Rip Rap Paving.		
529 cu. yds. rip rap stone	$357	$0.675
8 dys. inspecting rip rap	15	0.030
136⅝ dys. loading and unloading	255	0.480
Total for 529 cu. yds.	$627	$1.185

The total cost of the dam on rock from the above figures is as follows:

408 lin. ft. per lin. ft.	$107.63
849,409 M. ft. B. M. timber per M. ft.	$51.70

The cost of the corner protecting crib built above the dam was as follows:

Cribwork.	Total.	Per M. Ft.
21,966 M. ft. pine	$306	$13.94
772 lbs. iron at 2.06 cts.	16	0.72
36⅝ dys. hauling and stacking timber	57	2.60
79⅜ dys. framing and placing timber	151	6.85
Total for 21,966 M. ft.	$530	$24.11
Stone Filling.	**Total.**	**Per Cu. Yd.**
292 cu. yds. stone	$ 204	$0.70
Fuel	9	0.03
4 dys. inspecting stone	8	0.03
129½ dys. filling in stone	242	0.82
Total for 292 cu. yds.	$463	$1.58
197¾ dys. placing derrick stone	$ 388	
3½ dys. excavation	7	
Total	$ 395	
Grand total cost of crib	$1,388	

The grand total cost of the dam was $67,043 for 658 lin. ft., or $102 per lin. ft.

The cost of general supervision and subsistence is included in the cost of labor as shown by the above account. General supervision includes the assistant engineer in local charge and his office force in the field. Subsistence includes cost of provisions, fuel and pay of cooks and helpers. Foremen and enginemen received from $50 to $90 per month and subsistence. Laborers received $1.20 with or $1.50 without subsistence, for days of 8 hours. A few laborers were employed by the month at from $30 to $40 per month, with subsistence.

The Doctrine of "Adverse Possession" and Its Significance to the Surveyor.*

It is a belief widely prevalent among laymen that a surveyor is a kind of dictator, or czar over land boundaries, who, armed with the authority of a deed description, has power to establish, modify or remove such boundaries, according as they fit the measures of his transit and his chain. Especially is this true if the surveyor be a county surveyor, invested in the additional awe of public office. Even among trained surveyors and engineers a similar belief in the supremacy of the calls of a paper description, when they come into conflict with old fence lines or other old boundaries, is far from uncommon. But *in the eyes of the law* it is not so. In the eyes of the law, by virtue of the doctrine of "Adverse Possession," the "old fence" becomes more or less sacred, venerable; an institution, in fact, not to be lightly overturned by the mere edict of a deed, however strictly such deed may conform to the legal requirements of its kind. The doctrine of "Adverse Possession" is thus an important one for the surveyor to understand, as many a surveyor's client has found to his cost. A surveyor, indeed, cannot estimate the value of his work without a knowledge of it. Yet, excepting in one instance, the subject is not even mentioned in the Manuals or Textbooks of Surveying with which we are acquainted, and it is with the object of filling in, however modestly, this hiatus in the literature of surveying, that the present writers have prepared this paper.

In order to be understood in its narrower relation to the surveyor, the doctrine must first be looked at briefly in its fuller and broader aspect. It is, in brief, in relation to land, what may be called a doctrine of legalized "squatter sovereignty." In virtue of it, the squatter upon land, if not ousted, becomes in time the true legal owner. A mere intruder at first, without the shred of a paper or other legal title, by simply squatting and sticking, he becomes at last firmly fixed. Writs of ejectment are powerless against him. He has struck legal root in the soil; you can no longer oust him. His arm at first single, has now behind it the arm of the law.

The squatter's title, to become thus legal, must satisfy certain requirements. It must be "open possession," visible and patent to anybody; "notorious," proclaimed by acts which unmistakably imply ownership. It must be "continuous" possession; there must be no break or lapse; and it must be possession "hostile" to the claim of the true owner, that is, possession not by allowance or permission of any kind, but with assertion in some way of ownership by the squatter. Such assertion of ownership, however, need not be by word. Acts may be quite sufficient. "The rule seems to be well settled that acts of notoriety, such as building a fence around the land, entering upon the land and making improvements thereon, raising crops and felling trees thereon, are presumptive evidence, and evidence of intention to assert ownership over and possession of the property; and taxation of the land for a series of years to the person claiming it, and the payment of taxes by

*A paper by Geo. L. Teeple and Leonard S. Smith, reprinted from the Wisconsin Engineer, Dec., 1909.

him, are competent evidence tending to show ownership."*

Finally and from the moral point of view, somewhat curiously, good faith is quite necessary. A scoundrel farmer can steal a strip of his good neighbor's land by simply building the division fence in the wrong place, knowing that he does so, and unless the good neighbor removes the fence in time, he will lose the stolen strip irrecoverably. The law will protect the thief.

Indeed by a curious interpretation in certain states, the law in those states seems to demand that the interloping fence-builder actually be a scoundrel before it will give him legal possession of the disputed strip. If he swallows his neighbor's land innocently, the law makes him "cough up." If he swallows it feloniously, with avarice aforethought, the law applies a digestive instead of an emetic. Thus may scoundrels fatten. Of this, however, more later.

The doctrine, thus, in certain cases and under certain interpretations, seems like a curious moral monstrosity. But looked at in its broader aspects, it takes on a different aspect.

It supports the claim of the real developer and user of property as against the speculator who would let it lie idle. It hits at the lax and the laggard, who does not look after his own. "Unto him that hath shall be given, and from him that hath not shall be taken even that which he hath." It hits also at the shyster attorney, who, raking up some stale claim, years after the evidence has become dim, and the witnesses dead and gone, would use it to blackmail and browbeat perhaps some widow or child, the innocent holder of real property. It quiets claims. It bars the re-opening of closed issues. It says that claims as well as persons are subject to death and dissolution, and that in land titles also, a live dog is better than a dead lion.

Before leaving this broader and more general view of the doctrine, it is proper to distinguish the two broad cases under which land may be adversely held. There may be (a) Adverse Possession "without color of title," and (b) Adverse Possession "with color of title."

The first case, that without color of title, is the case of the squatter pure and simple, who can produce no evidence whatever, written or spoken, that he ever held proper legal title to the land in question.

In this case (we believe in every state in the Union) twenty years possession, satisfying the requirements which have been mentioned, will ripen the squattership into perfect legal title.

The second class, wherein the Adverse Possession is said to be "with color of title," covers those cases in which, whether by fraud or by error, a paper title to the property in question has been given, but a paper title which is in some way defective, so that it fails of being legal or binding.

In all such cases, which constitute Adverse Possession with color of title, a period of ten years is sufficient to ripen the possession into a perfect claim.

With these general principles in mind, we may now turn to the circumstances which make this doctrine of interest to the surveyor. Suppose Mr. Brown's west line, which is Mr. Jones' east line, is marked by an old fence, which has stood for twenty years or more. Suppose now Mr. Jones wishes to sell his property to Mr. Robinson who, being a particular man, demands a survey, and monuments set, which the deed shall call for. The survey is made and it is discovered that the true line is four rods west of the old fence, cutting off also Mr. Jones' barn, which, in ignorance of the true bounds, he has built upon what by the terms of the deeds both of Brown and Jones, is Brown's land. What is to be done? Both Brown and Jones have always supposed the old fence to be the true line. They, in fact, twenty-one years preceding this time, by mutual agreement built the fence as marking the line. Now Jones wakes up to find that he has apparently surveyed himself out of a good barn and four acres of land, which he must deliver over to Brown.

But must he? It is a case of Adverse Possession. Jones has been an innocent squatter upon the land of Brown. He has been such an innocent squatter for a period exceeding twenty years, and in accordance with the principles enunciated, his barn is still safely his own, and he is owner also of Brown's four acres as legally as if he could produce the most perfect paper title. Brown has been the real Rip Van Winkle. He slept just one year too long. There was really no need for a surveyor. The surveyor has indeed already been on the ground—old Father Time himself—has measured it with his twenty year chain, and declared for the old fence line.

The Supreme Courts of all our states are in practically unanimous harmony regarding such cases as that just cited—the case of distinct agreement between two abutting owners upon a boundary, in ignorance that it is incorrect.*

And it should be noted that in this case the boundary may be established by monument as well as by "visible boundary."

But suppose Messrs. Jones and Brown, or either of them had built the fence not as a boundary line, but as a matter of convenience or necessity, recognizing distinctly that it was not the true boundary? The decisions of our courts are here again practically unanimous, but to the opposite effect;—the fence, however long the lapse of time, will not become the legal boundary, and a survey in such a case would be necessary to establish where the boundary lies.*

A third possibility remains, and one which includes by far the greater number of cases which actually occurs—that in which Brown and Jones, or either of them, builds the fence, supposing it to be on the true line, but under no distinct agreement to abide by it as the line,—the case of tacit consent. Upon this case, unfortunately, the agreement of the courts is not unanimous.

In by far the larger number of the states, the Supreme Courts have held that such cases belong in the same class as the case first discussed; the building of the fence line and the holding to it, constituting in the absence of evidence to the contrary, a virtual agreement that it is the true line, and therefore such a fence line, with the lapse of the necessary period, becomes the legal line.

The Supreme Courts of Maine and Missouri, however, followed at times by those of a few other states, have held a modification of this doctrine. And it is here that the curious twist is introduced already referred to, whereby it would appear that a man, in order to profit by the building of an erroneous fence, must confess himself a virtual land pirate. These courts held that where such an error had been made in marking and holding to a property line, through pure ignorance and mistake, and with no intent to go beyond the true line, the doctrine of Adverse Possession does not apply.*

The true line when discovered, holds; the erroneous fence line must yield. Thus our friend Jones, if there had been no specific agreement, and if he had built the erroneous fence line in pure innocence, would have had to give up his barn and the four acres.

But if he had *intentionally* built the fence line upon Brown's land, knowing that he did so, and sworn in a Maine court that he held to it as his line, without regard to Brown's real rights in the matter, the Maine court would say to him, "The land is yours."

Summing up, then, the results of our study in one general statement, we may say that by far the larger majority of our State Supreme Courts have held that unless the division fence has been built on the distinct understanding that it is not the true line, the building and maintaining of it as a division fence for the requisite period, will make it the legal line, whether in agreement with the calls of the deeds or not, the exceptional cases being those just discussed under what we have called the Maine-Missouri doctrine.

It is well at this point, perhaps, to discuss more fully the difference as to ownership of the disputed strip, between those cases where the adverse possession is with color of title and those in which it is without. Bearing in mind that in the vast majority of cases adverse possession with color of title means possession under authority of some written instrument, but a written instrument is in some manner defective so that it fails to make the title good, while adverse possession without color of title no legal sanction whatever can be shown for the holding of the land beyond the bare fact of the possession itself, the governing principle may be simply stated thus:

When in the case of two adjoining pieces of property, the calls of the two deeds, with reference to the common boundary, are identical, and the fence line or other visible boundary, conflicts with this identical description, then the adverse possession of the disputed strip must be without color of title. Both deeds call for the same line; neither sanctions any departure from that line by an erring fence; hence the adverse possession can have no color of title, and to be effective must run twenty years. But when the calls of the two deeds conflict in regard to the common boundary, in such a way that the two properties, as described, overlap, we shall have adverse possession with color of title along the disputed line. And in this case the adverse possession will give perfect title in a period of ten years.

Suppose, for instance, that in the case above discussed the land of both Brown and Jones had been originally owned by Robinson. Robinson sold first to Brown, the line eventually to be in dispute being described as so many rods west of, and parallel to a certain stone wall. But no fence at this time was built. A year later say, Robinson sells to Jones, the line to be disputed being now described as so many rods east of, and parallel to, a certain section line, the two descriptions being in conformity with an erroneous original survey. Jones, wishing to build his barn near Brown's land, measures the distance from the section line correctly with a sixteen-and-one-half-foot pole, in accordance with the calls of his deed, and builds the division fence. Later he wishes to sell; a survey discloses the shortage in the original survey, Brown's west line, measured in accordance with his deed, from the stone wall, falling four rods west of the fence Jones has built. The two descriptions over-lap. Brown's deed being of prior date makes him, as far as the deeds alone are concerned, the legal owner of the overlap, and Jones' holding of the four rods is thus evidently adverse possession with color of title, since his deed by its description apparently entitles him to hold to the fence he has built. If the mistake disclosed by the resurvey is discovered within ten years, Brown retains the overlap. But if the discovery is not made until the ten years has entirely elapsed, he loses it to Jones, the title by adverse possession in such a case becoming legal and perfect at the end of that period. One important addition should be made in reference to the entire preceding discussion, which is this: that during the twenty years or the ten years necessary to ripen the adverse possession into perfect title, the disputed strip need not have continued in the possession of one single adverse owner. Jones may have sold to Smith, Smith to Tom, Tom to Dick and Dick to Harry, all within the ten or the twenty years necessary to perfect title, and if the "possessory estates are connected

*This was the view of the Wisconsin Supreme Court until about ten years ago.

and continuous," it is as if Jones held the disputed strip himself for the entire period.*

The above gives, we believe, the essence of the doctrine of Adverse Possession as between private individuals.
